|  | <i>ciphertext</i> | Input cipher text to decrypt |
|  | <i>inputSize</i>  | Size of input data in bytes  |
|  | <i>iv</i>         | Input initial vector         |
|  | <i>ivSize</i>     | Size of the IV               |

|     |                  |                                                                       |
|-----|------------------|-----------------------------------------------------------------------|
|     | <i>aad</i>       | Input additional authentication data                                  |
|     | <i>aadSize</i>   | Input size in bytes of AAD                                            |
|     | <i>key</i>       | Input key to use for encryption                                       |
|     | <i>keySize</i>   | Size of the input key, in bytes. Must be 16, 24, or 32.               |
| out | <i>plaintext</i> | Output plain text.                                                    |
|     | <i>tag</i>       | Input hash tag to compare. Set to NULL to skip tag processing.        |
|     | <i>tagSize</i>   | Input size of the tag, in bytes. Must be 4, 8, 12, 13, 14, 15, or 16. |

**Returns**

Status from encrypt/decrypt operation

**41.1.1.3.10** `ltc_status_t LTC_DRV_aes_encrypt_tag_ccm ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t * iv, uint32_t ivSize, const uint8_t * aad, uint32_t aadSize, const uint8_t * key, uint32_t keySize, uint8_t * ciphertext, uint8_t * tag, uint32_t tagSize )`

Encrypts AES using CCM block mode.

**Parameters**

|     |                   |                                                                                 |
|-----|-------------------|---------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number.                                                     |
|     | <i>plaintext</i>  | Input plain text to encrypt                                                     |
|     | <i>inputSize</i>  | Size of input data in bytes. Zero means authentication only.                    |
|     | <i>iv</i>         | Nonce                                                                           |
|     | <i>ivSize</i>     | Length of the Nonce in bytes. Must be 7, 8, 9, 10, 11, 12, or 13.               |
|     | <i>aad</i>        | Input additional authentication data. Can be NULL if aadSize is zero.           |
|     | <i>aadSize</i>    | Input size in bytes of AAD. Zero means data mode only (authentication skipped). |
|     | <i>key</i>        | Input key to use for encryption                                                 |
|     | <i>keySize</i>    | Size of the input key, in bytes. Must be 16, 24, or 32.                         |
| out | <i>ciphertext</i> | Output cipher text.                                                             |

## Overview

|     |                |                                                                                  |
|-----|----------------|----------------------------------------------------------------------------------|
| out | <i>tag</i>     | Generated output tag. Set to NULL to skip tag processing.                        |
|     | <i>tagSize</i> | Input size of the tag to generate, in bytes. Must be 4, 6, 8, 10, 12, 14, or 16. |

## Returns

Status from encrypt/decrypt operation

**41.1.1.3.11** `ltc_status_t LTC_DRV_aes_decrypt_tag_ccm ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t * iv, uint32_t ivSize, const uint8_t * aad, uint32_t aadSize, const uint8_t * key, uint32_t keySize, uint8_t * plaintext, const uint8_t * tag, uint32_t tagSize )`

Decrypts AES using CCM block mode.

## Parameters

|     |                   |                                                                                                                |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number.                                                                                    |
|     | <i>ciphertext</i> | Input cipher text to decrypt                                                                                   |
|     | <i>inputSize</i>  | Size of input data in bytes. Zero means authentication only.                                                   |
|     | <i>iv</i>         | Nonce                                                                                                          |
|     | <i>ivSize</i>     | Length of the Nonce in bytes. Must be 7, 8, 9, 10, 11, 12, or 13.                                              |
|     | <i>aad</i>        | Input additional authentication data. Can be NULL if aadSize is zero.                                          |
|     | <i>aadSize</i>    | Input size in bytes of AAD. Zero means data mode only (authentication skipped).                                |
|     | <i>key</i>        | Input key to use for decryption                                                                                |
|     | <i>keySize</i>    | Size of the input key, in bytes. Must be 16, 24, or 32.                                                        |
| out | <i>plaintext</i>  | Output plain text.                                                                                             |
|     | <i>tag</i>        | Received tag. Set to NULL to skip tag processing.                                                              |
|     | <i>tagSize</i>    | Input size of the received tag to compare with the computed tag, in bytes. Must be 4, 6, 8, 10, 12, 14, or 16. |

Returns

Status from encrypt/decrypt operation

## Overview

### 41.1.2 LTC DES driver

#### 41.1.2.1 Overview

This section describes the programming interface of the LTC DES driver.

#### Macros

- #define [LTC\\_DES\\_KEY\\_SIZE](#) 8  
*LTC DES key size - 64 bits.*
- #define [LTC\\_2DES\\_KEY\\_SIZE](#) 16  
*LTC DES two key size - 128 bits.*
- #define [LTC\\_3DES\\_KEY\\_SIZE](#) 24  
*LTC DES three key size - 196 bits.*
- #define [LTC\\_DES\\_IV\\_SIZE](#) 8  
*LTC DES IV size - 8 bytes.*

#### Functions

- [ltc\\_status\\_t LTC\\_DRV\\_des\\_encrypt\\_ecb](#) (uint32\_t instance, const uint8\_t plaintext[8], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t ciphertext[8])  
*Encrypts DES using ECB block mode.*
- [ltc\\_status\\_t LTC\\_DRV\\_des\\_decrypt\\_ecb](#) (uint32\_t instance, const uint8\_t ciphertext[8], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t plaintext[8])  
*Decrypts DES using ECB block mode.*
- [ltc\\_status\\_t LTC\\_DRV\\_des\\_encrypt\\_cbc](#) (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)  
*Encrypts DES using CBC block mode.*
- [ltc\\_status\\_t LTC\\_DRV\\_des\\_decrypt\\_cbc](#) (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)  
*Decrypts DES using CBC block mode.*
- [ltc\\_status\\_t LTC\\_DRV\\_des\\_encrypt\\_cfb](#) (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)  
*Encrypts DES using CFB block mode.*
- [ltc\\_status\\_t LTC\\_DRV\\_des\\_decrypt\\_cfb](#) (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)  
*Decrypts DES using CFB block mode.*
- [ltc\\_status\\_t LTC\\_DRV\\_des\\_encrypt\\_ofb](#) (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)  
*Encrypts DES using OFB block mode.*
- [ltc\\_status\\_t LTC\\_DRV\\_des\\_decrypt\\_ofb](#) (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)

- `_t *plaintext)`  
*Decrypts DES using OFB block mode.*
- `ltc_status_t LTC_DRV_des2_encrypt_ecb` (uint32\_t instance, const uint8\_t plaintext[8], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t ciphertext[8])  
*Encrypts triple DES using ECB block mode with two keys.*
  - `ltc_status_t LTC_DRV_des2_decrypt_ecb` (uint32\_t instance, const uint8\_t ciphertext[8], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t plaintext[8])  
*Decrypts triple DES using ECB block mode with two keys.*
  - `ltc_status_t LTC_DRV_des2_encrypt_cbc` (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)  
*Encrypts triple DES using CBC block mode with two keys.*
  - `ltc_status_t LTC_DRV_des2_decrypt_cbc` (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)  
*Decrypts triple DES using CBC block mode with two keys.*
  - `ltc_status_t LTC_DRV_des2_encrypt_cfb` (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)  
*Encrypts triple DES using CFB block mode with two keys.*
  - `ltc_status_t LTC_DRV_des2_decrypt_cfb` (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)  
*Decrypts triple DES using CFB block mode with two keys.*
  - `ltc_status_t LTC_DRV_des2_encrypt_ofb` (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)  
*Encrypts triple DES using OFB block mode with two keys.*
  - `ltc_status_t LTC_DRV_des2_decrypt_ofb` (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)  
*Decrypts triple DES using OFB block mode with two keys.*
  - `ltc_status_t LTC_DRV_des3_encrypt_ecb` (uint32\_t instance, const uint8\_t plaintext[8], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], const uint8\_t key3[LTC\_DES\_KEY\_SIZE], uint8\_t ciphertext[8])  
*Encrypts triple DES using ECB block mode with three keys.*

*Encrypts triple DES using CBC block mode with three keys.*
  - `ltc_status_t LTC_DRV_des3_decrypt_cbc` (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t

## Overview

t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], const uint8\_t key3[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)

*Decrypts triple DES using CBC block mode with three keys.*

- **ltc\_status\_t LTC\_DRV\_des3\_encrypt\_cfb** (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], const uint8\_t key3[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)

*Encrypts triple DES using CFB block mode with three keys.*

- **ltc\_status\_t LTC\_DRV\_des3\_decrypt\_cfb** (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], const uint8\_t key3[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)

*Decrypts triple DES using CFB block mode with three keys.*

- **ltc\_status\_t LTC\_DRV\_des3\_encrypt\_ofb** (uint32\_t instance, const uint8\_t \*plaintext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], const uint8\_t key3[LTC\_DES\_KEY\_SIZE], uint8\_t \*ciphertext)

*Encrypts triple DES using OFB block mode with three keys.*

- **ltc\_status\_t LTC\_DRV\_des3\_decrypt\_ofb** (uint32\_t instance, const uint8\_t \*ciphertext, uint32\_t inputSize, const uint8\_t iv[LTC\_DES\_IV\_SIZE], const uint8\_t key1[LTC\_DES\_KEY\_SIZE], const uint8\_t key2[LTC\_DES\_KEY\_SIZE], const uint8\_t key3[LTC\_DES\_KEY\_SIZE], uint8\_t \*plaintext)

*Decrypts triple DES using OFB block mode with three keys.*

### 41.1.2.2 Macro Definition Documentation

41.1.2.2.1 **#define LTC\_DES\_KEY\_SIZE 8**

41.1.2.2.2 **#define LTC\_2DES\_KEY\_SIZE 16**

41.1.2.2.3 **#define LTC\_3DES\_KEY\_SIZE 24**

### 41.1.2.3 Function Documentation

41.1.2.3.1 **ltc\_status\_t LTC\_DRV\_des\_encrypt\_ecb ( uint32\_t instance, const uint8\_t plaintext[8], const uint8\_t key[LTC\_DES\_KEY\_SIZE], uint8\_t ciphertext[8] )**

Encrypts DES using ECB block mode.

Parameters

---

|     |                   |                                                      |
|-----|-------------------|------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                           |
|     | <i>plaintext</i>  | Input single block (64-bits) of plaintext to encrypt |
|     | <i>key</i>        | Input key to use for encryption                      |
| out | <i>ciphertext</i> | Output single block (64-bits) of ciphertext          |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.2** `ltc_status_t LTC_DRV_des_decrypt_ecb ( uint32_t instance, const uint8_t ciphertext[8], const uint8_t key[LTC_DES_KEY_SIZE], uint8_t plaintext[8] )`

Decrypts DES using ECB block mode.

Parameters

|     |                   |                                                       |
|-----|-------------------|-------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                            |
|     | <i>ciphertext</i> | Input single block (64-bits) of ciphertext to decrypt |
|     | <i>key</i>        | Input key to use for decryption                       |
| out | <i>plaintext</i>  | Output single block (64-bits) of plaintext            |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.3** `ltc_status_t LTC_DRV_des_encrypt_cbc ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts DES using CBC block mode.

Parameters

|  |                  |                            |
|--|------------------|----------------------------|
|  | <i>instance</i>  | LTC module instance number |
|  | <i>plaintext</i> | Input plaintext to encrypt |

## Overview

|     |                   |                                                                                                                                  |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                      |
|     | <i>iv</i>         | Input initial vector to combine with the first plaintext block. The iv does not need to be secret, but it must be unpredictable. |
|     | <i>key</i>        | Input key to use for encryption                                                                                                  |
| out | <i>ciphertext</i> | Output ciphertext                                                                                                                |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.4** `ltc_status_t LTC_DRV_des_decrypt_cbc ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts DES using CBC block mode.

### Parameters

|     |                   |                                                                                                                                  |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                       |
|     | <i>ciphertext</i> | Input ciphertext to decrypt                                                                                                      |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                      |
|     | <i>iv</i>         | Input initial vector to combine with the first plaintext block. The iv does not need to be secret, but it must be unpredictable. |
|     | <i>key</i>        | Input key to use for decryption                                                                                                  |
| out | <i>plaintext</i>  | Output plaintext                                                                                                                 |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.5** `ltc_status_t LTC_DRV_des_encrypt_cfb ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts DES using CFB block mode.

Parameters

|     |                   |                                 |
|-----|-------------------|---------------------------------|
|     | <i>instance</i>   | LTC module instance number      |
|     | <i>plaintext</i>  | Input plaintext to encrypt      |
|     | <i>inputSize</i>  | Size of input data in bytes     |
|     | <i>iv</i>         | Input initial block.            |
|     | <i>key</i>        | Input key to use for encryption |
| out | <i>ciphertext</i> | Output ciphertext               |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.6** `ltc_status_t LTC_DRV_des_decrypt_cfb ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts DES using CFB block mode.

Parameters

|     |                   |                                 |
|-----|-------------------|---------------------------------|
|     | <i>instance</i>   | LTC module instance number      |
|     | <i>ciphertext</i> | Input ciphertext to decrypt     |
|     | <i>inputSize</i>  | Size of input data in bytes     |
|     | <i>iv</i>         | Input initial block.            |
|     | <i>key</i>        | Input key to use for decryption |
| out | <i>plaintext</i>  | Output plaintext                |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.7** `ltc_status_t LTC_DRV_des_encrypt_ofb ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts DES using OFB block mode.

## Overview

### Parameters

|     |                   |                                                                                                                            |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                 |
|     | <i>plaintext</i>  | Input plaintext to encrypt                                                                                                 |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                |
|     | <i>iv</i>         | Input unique input vector. The OFB mode requires that the IV be unique for each execution of the mode under the given key. |
|     | <i>key</i>        | Input key to use for encryption                                                                                            |
| out | <i>ciphertext</i> | Output ciphertext                                                                                                          |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.8** `ltc_status_t LTC_DRV_des_decrypt_ofb ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts DES using OFB block mode.

### Parameters

|     |                   |                                                                                                                            |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                 |
|     | <i>ciphertext</i> | Input ciphertext to decrypt                                                                                                |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                |
|     | <i>iv</i>         | Input unique input vector. The OFB mode requires that the IV be unique for each execution of the mode under the given key. |
|     | <i>key</i>        | Input key to use for decryption                                                                                            |
| out | <i>plaintext</i>  | Output plaintext                                                                                                           |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.9** `ltc_status_t LTC_DRV_des2_encrypt_ecb ( uint32_t instance, const uint8_t plaintext[8], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t ciphertext[8] )`

Encrypts triple DES using ECB block mode with two keys.

Parameters

|     |                   |                                                      |
|-----|-------------------|------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                           |
|     | <i>plaintext</i>  | Input single block (64-bits) of plaintext to encrypt |
|     | <i>key1</i>       | First input key for key bundle                       |
|     | <i>key2</i>       | Second input key for key bundle                      |
| out | <i>ciphertext</i> | Output single block (64-bits) of ciphertext          |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.10** `ltc_status_t LTC_DRV_des2_decrypt_ecb ( uint32_t instance, const uint8_t ciphertext[8], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t plaintext[8] )`

Decrypts triple DES using ECB block mode with two keys.

Parameters

|     |                   |                                                       |
|-----|-------------------|-------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                            |
|     | <i>ciphertext</i> | Input single block (64-bits) of ciphertext to decrypt |
|     | <i>key1</i>       | First input key for key bundle                        |
|     | <i>key2</i>       | Second input key for key bundle                       |
| out | <i>plaintext</i>  | Output single block (64-bits) of plaintext            |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.11** `ltc_status_t LTC_DRV_des2_encrypt_cbc ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts triple DES using CBC block mode with two keys.

## Overview

### Parameters

|     |                   |                                                                                                                                  |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                       |
|     | <i>plaintext</i>  | Input plaintext to encrypt                                                                                                       |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                      |
|     | <i>iv</i>         | Input initial vector to combine with the first plaintext block. The iv does not need to be secret, but it must be unpredictable. |
|     | <i>key1</i>       | First input key for key bundle                                                                                                   |
|     | <i>key2</i>       | Second input key for key bundle                                                                                                  |
| out | <i>ciphertext</i> | Output ciphertext                                                                                                                |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.12** `ltc_status_t LTC_DRV_des2_decrypt_cbc ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts triple DES using CBC block mode with two keys.

### Parameters

|     |                   |                                                                                                                                  |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                       |
|     | <i>ciphertext</i> | Input ciphertext to decrypt                                                                                                      |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                      |
|     | <i>iv</i>         | Input initial vector to combine with the first plaintext block. The iv does not need to be secret, but it must be unpredictable. |
|     | <i>key1</i>       | First input key for key bundle                                                                                                   |
|     | <i>key2</i>       | Second input key for key bundle                                                                                                  |
| out | <i>plaintext</i>  | Output plaintext                                                                                                                 |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.13** `ltc_status_t LTC_DRV_des2_encrypt_cfb ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts triple DES using CFB block mode with two keys.

## Overview

### Parameters

|     |                   |                                 |
|-----|-------------------|---------------------------------|
|     | <i>instance</i>   | LTC module instance number      |
|     | <i>plaintext</i>  | Input plaintext to encrypt      |
|     | <i>inputSize</i>  | Size of input data in bytes     |
|     | <i>iv</i>         | Input initial block.            |
|     | <i>key1</i>       | First input key for key bundle  |
|     | <i>key2</i>       | Second input key for key bundle |
| out | <i>ciphertext</i> | Output ciphertext               |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.14** `ltc_status_t LTC_DRV_des2_decrypt_cfb ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts triple DES using CFB block mode with two keys.

### Parameters

|     |                   |                                 |
|-----|-------------------|---------------------------------|
|     | <i>instance</i>   | LTC module instance number      |
|     | <i>ciphertext</i> | Input ciphertext to decrypt     |
|     | <i>inputSize</i>  | Size of input data in bytes     |
|     | <i>iv</i>         | Input initial block.            |
|     | <i>key1</i>       | First input key for key bundle  |
|     | <i>key2</i>       | Second input key for key bundle |
| out | <i>plaintext</i>  | Output plaintext                |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.15** `ltc_status_t LTC_DRV_des2_encrypt_ofb ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts triple DES using OFB block mode with two keys.

Parameters

|     |                   |                                                                                                                            |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                 |
|     | <i>plaintext</i>  | Input plaintext to encrypt                                                                                                 |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                |
|     | <i>iv</i>         | Input unique input vector. The OFB mode requires that the IV be unique for each execution of the mode under the given key. |
|     | <i>key1</i>       | First input key for key bundle                                                                                             |
|     | <i>key2</i>       | Second input key for key bundle                                                                                            |
| out | <i>ciphertext</i> | Output ciphertext                                                                                                          |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.16** `ltc_status_t LTC_DRV_des2_decrypt_ofb ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts triple DES using OFB block mode with two keys.

Parameters

|     |                   |                                                                                                                            |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                 |
|     | <i>ciphertext</i> | Input ciphertext to decrypt                                                                                                |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                |
|     | <i>iv</i>         | Input unique input vector. The OFB mode requires that the IV be unique for each execution of the mode under the given key. |
|     | <i>key1</i>       | First input key for key bundle                                                                                             |
|     | <i>key2</i>       | Second input key for key bundle                                                                                            |
| out | <i>plaintext</i>  | Output plaintext                                                                                                           |

Returns

Status from encrypt/decrypt operation

## Overview

**41.1.2.3.17** `ltc_status_t LTC_DRV_des3_encrypt_ecb ( uint32_t instance, const uint8_t plaintext[8], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t ciphertext[8] )`

Encrypts triple DES using ECB block mode with three keys.

Parameters

|     |                   |                                                      |
|-----|-------------------|------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                           |
|     | <i>plaintext</i>  | Input single block (64-bits) of plaintext to encrypt |
|     | <i>key1</i>       | First input key for key bundle                       |
|     | <i>key2</i>       | Second input key for key bundle                      |
|     | <i>key3</i>       | Third input key for key bundle                       |
| out | <i>ciphertext</i> | Output single block (64-bits) of ciphertext          |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.18** `ltc_status_t LTC_DRV_des3_decrypt_ecb ( uint32_t instance, const uint8_t ciphertext[8], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t plaintext[8] )`

Decrypts triple DES using ECB block mode with three keys.

Parameters

|     |                   |                                                       |
|-----|-------------------|-------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                            |
|     | <i>ciphertext</i> | Input single block (64-bits) of ciphertext to decrypt |
|     | <i>key1</i>       | First input key for key bundle                        |
|     | <i>key2</i>       | Second input key for key bundle                       |
|     | <i>key3</i>       | Third input key for key bundle                        |
| out | <i>plaintext</i>  | Output single block (64-bits) of plaintext            |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.19** `ltc_status_t LTC_DRV_des3_encrypt_cbc ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts triple DES using CBC block mode with three keys.

## Overview

### Parameters

|     |                   |                                                                                                                                  |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                       |
|     | <i>plaintext</i>  | Input plaintext to encrypt                                                                                                       |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                      |
|     | <i>iv</i>         | Input initial vector to combine with the first plaintext block. The iv does not need to be secret, but it must be unpredictable. |
|     | <i>key1</i>       | First input key for key bundle                                                                                                   |
|     | <i>key2</i>       | Second input key for key bundle                                                                                                  |
|     | <i>key3</i>       | Third input key for key bundle                                                                                                   |
| out | <i>ciphertext</i> | Output ciphertext                                                                                                                |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.20** `ltc_status_t LTC_DRV_des3_decrypt_cbc ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts triple DES using CBC block mode with three keys.

### Parameters

|  |                   |                                                                                                                                  |
|--|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
|  | <i>instance</i>   | LTC module instance number                                                                                                       |
|  | <i>ciphertext</i> | Input ciphertext to decrypt                                                                                                      |
|  | <i>inputSize</i>  | Size of input data in bytes                                                                                                      |
|  | <i>iv</i>         | Input initial vector to combine with the first plaintext block. The iv does not need to be secret, but it must be unpredictable. |
|  | <i>key1</i>       | First input key for key bundle                                                                                                   |
|  | <i>key2</i>       | Second input key for key bundle                                                                                                  |
|  | <i>key3</i>       | Third input key for key bundle                                                                                                   |

|     |                  |                  |
|-----|------------------|------------------|
| out | <i>plaintext</i> | Output plaintext |
|-----|------------------|------------------|

Returns

Status from encrypt/decrypt operation

**41.1.2.3.21** `ltc_status_t LTC_DRV_des3_encrypt_cfb ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts triple DES using CFB block mode with three keys.

Parameters

|     |                   |                                 |
|-----|-------------------|---------------------------------|
|     | <i>instance</i>   | LTC module instance number      |
|     | <i>plaintext</i>  | Input plaintext to encrypt      |
|     | <i>inputSize</i>  | Size of input data in bytes     |
|     | <i>iv</i>         | Input initial block.            |
|     | <i>key1</i>       | First input key for key bundle  |
|     | <i>key2</i>       | Second input key for key bundle |
|     | <i>key3</i>       | Third input key for key bundle  |
| out | <i>ciphertext</i> | Output ciphertext               |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.22** `ltc_status_t LTC_DRV_des3_decrypt_cfb ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts triple DES using CFB block mode with three keys.

## Overview

### Parameters

|     |                   |                                 |
|-----|-------------------|---------------------------------|
|     | <i>instance</i>   | LTC module instance number      |
|     | <i>ciphertext</i> | Input ciphertext to decrypt     |
|     | <i>inputSize</i>  | Size of input data in bytes     |
|     | <i>iv</i>         | Input initial block.            |
|     | <i>key1</i>       | First input key for key bundle  |
|     | <i>key2</i>       | Second input key for key bundle |
|     | <i>key3</i>       | Third input key for key bundle  |
| out | <i>plaintext</i>  | Output plaintext                |

### Returns

Status from encrypt/decrypt operation

**41.1.2.3.23** `ltc_status_t LTC_DRV_des3_encrypt_ofb ( uint32_t instance, const uint8_t * plaintext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t * ciphertext )`

Encrypts triple DES using OFB block mode with three keys.

### Parameters

|     |                   |                                                                                                                            |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                 |
|     | <i>plaintext</i>  | Input plaintext to encrypt                                                                                                 |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                |
|     | <i>iv</i>         | Input unique input vector. The OFB mode requires that the IV be unique for each execution of the mode under the given key. |
|     | <i>key1</i>       | First input key for key bundle                                                                                             |
|     | <i>key2</i>       | Second input key for key bundle                                                                                            |
|     | <i>key3</i>       | Third input key for key bundle                                                                                             |
| out | <i>ciphertext</i> | Output ciphertext                                                                                                          |

Returns

Status from encrypt/decrypt operation

**41.1.2.3.24** `ltc_status_t LTC_DRV_des3_decrypt_ofb ( uint32_t instance, const uint8_t * ciphertext, uint32_t inputSize, const uint8_t iv[LTC_DES_IV_SIZE], const uint8_t key1[LTC_DES_KEY_SIZE], const uint8_t key2[LTC_DES_KEY_SIZE], const uint8_t key3[LTC_DES_KEY_SIZE], uint8_t * plaintext )`

Decrypts triple DES using OFB block mode with three keys.

Parameters

|     |                   |                                                                                                                            |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC module instance number                                                                                                 |
|     | <i>ciphertext</i> | Input ciphertext to decrypt                                                                                                |
|     | <i>inputSize</i>  | Size of input data in bytes                                                                                                |
|     | <i>iv</i>         | Input unique input vector. The OFB mode requires that the IV be unique for each execution of the mode under the given key. |
|     | <i>key1</i>       | First input key for key bundle                                                                                             |
|     | <i>key2</i>       | Second input key for key bundle                                                                                            |
|     | <i>key3</i>       | Third input key for key bundle                                                                                             |
| out | <i>plaintext</i>  | Output plaintext                                                                                                           |

Returns

Status from encrypt/decrypt operation

## LTC HAL driver

### 41.2 LTC HAL driver

#### 41.2.1 Overview

This section describes the programming interface of the LTC HAL driver.

#### Data Structures

- struct `ltc_hal_pkha_mode_params_t`  
*LTC PKHA parameters. [More...](#)*

#### Typedefs

- typedef uint32\_t `ltc_hal_mode_t`  
*Full word representing the actual bit values for the LTC mode register.*

#### Enumerations

- enum `ltc_status_err_shift_t` { `kStatus_LTC_ErrShift` = 4 }
- enum `ltc_status_t` { ,  
`kStatus_LTC_Error` = 0x00000005U,  
`kStatus_LTC_ModeError` = 0x00000015U,  
`kStatus_LTC_DataSizeError` = 0x00000025U,  
`kStatus_LTC_KeySizeError` = 0x00000035U,  
`kStatus_LTC_PKHA_RegASzError` = 0x00000045U,  
`kStatus_LTC_PKHA_RegBSzError` = 0x00000055U,  
`kStatus_LTC_DataOutOfSeqError` = 0x00000065U,  
`kStatus_LTC_PKHA_DivByZeroError` = 0x00000075U,  
`kStatus_LTC_PKHA_ModulusEvenError` = 0x00000085U,  
`kStatus_LTC_DES_KeyParityError` = 0x00000095U,  
`kStatus_LTC_ICV_CheckFailed` = 0x000000A5U,  
`kStatus_LTC_InternalHwFailure` = 0x000000B5U,  
`kStatus_LTC_CCM_AadSzError` = 0x000000C5U,  
`kStatus_LTC_CCM_InvalidCryptoSel` = 0x000000F5U,  
`kStatus_LTC_OSAError` = 0x00000006U }
- enum `ltc_hal_algorithm_t`  
*LTC algorithm mode.*
- enum `ltc_hal_pkha_reg_area_t`  
*Register areas for PKHA clear memory operations.*
- enum `ltc_hal_pkha_clr_quad_area_t`  
*Quadrant areas for 2048-bit registers for PKHA clear memory operations.*
- enum `ltc_hal_pkha_quad_area_t`  
*Quadrant areas for 2048-bit registers for PKHA copy memory operations.*
- enum `ltc_hal_pkha_montgomery_form_t`

- Montgomery or normal PKHA input format.*

  - enum `ltc_hal_pkha_f2m_t` {  
`kLTC_PKHA_Integer_Arith` = 0U,  
`kLTC_PKHA_F2M_Arith` = 1U }

*Integer vs binary polynomial arithmetic selection.*

  - enum `ltc_hal_pkha_r2_t` {  
`kLTC_PKHA_R2_Calc` = 0U,  
`kLTC_PKHA_R2_Input` = 1U }

*User-supplied ( $R^2 \bmod N$ ) input or LTC should calculate.*

  - enum `ltc_hal_pkha_timing_t`  
*Use of timing equalized version of a PKHA function.*
  - enum `ltc_hal_pkha_output_reg_t`  
*Select PKHA output destination register.*
  - enum `ltc_hal_pkha_func_t` { ,  
`kLTC_PKHA_Arith_ModAdd` = 2U,  
`kLTC_PKHA_Arith_ModSub1` = 3U,  
`kLTC_PKHA_Arith_ModSub2` = 4U,  
`kLTC_PKHA_Arith_ModMul` = 5U,  
`kLTC_PKHA_Arith_ModExp` = 6U,  
`kLTC_PKHA_Arith_ModRed` = 7U,  
`kLTC_PKHA_Arith_ModInv` = 8U,  
`kLTC_PKHA_Arith_ECCAdd` = 9U,  
`kLTC_PKHA_Arith_ECCDouble` = 10U,  
`kLTC_PKHA_Arith_ECCMul` = 11U,  
`kLTC_PKHA_Arith_ModR2` = 12U,  
`kLTC_PKHA_Arith_GCD` = 14U,  
`kLTC_PKHA_Arith_PrimalityTest` = 15U }

*PKHA functions - arithmetic, copy/clear memory.*

  - enum `ltc_hal_mode_encrypt_t`  
*LTC encrypt/decrypt mode for symmetric key operations.*
  - enum `ltc_hal_mode_icv_check_t`  
*LTC ICV check enable/disable.*
  - enum `ltc_hal_mode_algorithm_state_t`  
*LTC algorithm state.*
  - enum `ltc_hal_mode_symmetric_alg_t`  
*LTC symmetric key encryption/decryption operating mode.*
  - enum `ltc_hal_mode_decrypt_key_t`  
*LTC ModeR Register AAI field DK bit.*
  - enum `ltc_hal_cmd_t` {  
`kLTCCmd_ResetAll` = 1U << LTC\_COM\_ALL\_SHIFT,  
`kLTCCmd_ResetAES` = 1U << LTC\_COM\_AES\_SHIFT,  
`kLTCCmd_ResetDES` = 1U << LTC\_COM\_DES\_SHIFT,  
`kLTCCmd_ResetPKHA` = 1U << LTC\_COM\_PK\_SHIFT }

*LTC reset command.*

  - enum `ltc_hal_key_lock_t` {  
`kLTCtrl_KeyRegisterReadable` = 0U,  
`kLTCtrl_KeyRegisterNotReadable` = 1U }

*LTC key register read access.*

## LTC HAL driver

- enum `ltc_hal_byte_swap_t` {  
`kLTCCtrl_ByteNoSwap = 0U`,  
`kLTCCtrl_ByteSwap = 1U` }  
*LTC byte swap.*
- enum `ltc_hal_fifo_dma_size_t` {  
`kLTCCtrl_DMASize_1byte = 0U`,  
`kLTCCtrl_DMASize_4byte = 1U` }  
*LTC FIFO DMA request size.*
- enum `ltc_hal_dma_enable_t` {  
`kLTCCtrl_DMA_Disabled = 0U`,  
`kLTCCtrl_DMA_Enabled = 1U` }  
*LTC DMA module enable.*
- enum `ltc_hal_isr_mask_t` {  
`kLTCCtrl_ISR_Not_Masked = 0U`,  
`kLTCCtrl_ISR_Masked = 1U` }  
*LTC Interrupt mask.*
- enum `ltc_hal_clear_written_t`  
*LTC clear register.*
- enum `ltc_hal_status_flag_t`  
*LTC status flags.*
- enum `ltc_hal_error_status_flag_t`  
*LTC error status flags.*
- enum `ltc_hal_fifo_status_t` {  
`kLTCFIFO_OutputFifoFull = 0x80000000U`,  
`kLTCFIFO_OutputFifoLevel = 0x007F0000U`,  
`kLTCFIFO_InputFifoFull = 0x00008000U`,  
`kLTCFIFO_InputFifoLevel = 0x0000007FU` }  
*LTC FIFO status.*

## Functions

- static `uint32_t LTC_HAL_GetWordFromUnaligned` (`const uint8_t *src`)  
*Reads an unaligned word.*
- static void `LTC_HAL_SetUnalignedFromWord` (`uint32_t srcWord`, `uint8_t *dst`)  
*Converts a 32-bit word into a byte array.*
- void `LTC_HAL_Init` (`LTC_Type *base`)  
*Initializes the LTC HAL.*
- static void `LTC_HAL_ModeSetAlgorithm` (`ltc_hal_mode_t *outMode`, `ltc_hal_algorithm_t alg`)  
*Sets the LTC operating algorithm.*
- static void `LTC_HAL_ModeSetEncrypt` (`ltc_hal_mode_t *outMode`, `ltc_hal_mode_encrypt_t encrypt`)  
*Sets the encrypt/decrypt mode.*
- static `ltc_hal_mode_encrypt_t LTC_HAL_ModeGetEncrypt` (`ltc_hal_mode_t *outMode`)  
*Gets the encrypt/decrypt mode.*
- static void `LTC_HAL_ModeSetICVTest` (`ltc_hal_mode_t *outMode`, `ltc_hal_mode_icv_check_t check`)  
*Sets the ICV test selection.*
- static void `LTC_HAL_ModeSetAlgorithmState` (`ltc_hal_mode_t *outMode`, `ltc_hal_mode_`

- `algorithm_state_t` as)  
*Sets the algorithm state.*
- static `ltc_hal_mode_algorithm_state_t` LTC\_HAL\_ModeGetAlgorithmState (`ltc_hal_mode_t` \*outMode)  
*Gets the algorithm state.*
  - static void LTC\_HAL\_ModeSetSymmetricAlg (`ltc_hal_mode_t` \*outMode, `ltc_hal_mode_symmetric_alg_t` alg)  
*Sets the symmetric algorithm.*
  - static void LTC\_HAL\_ModeSetDecryptKey (LTC\_Type \*base)  
*Sets the mode DK bit.*
  - static void LTC\_HAL\_PKHA\_ModeSetFunc (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_func_t` func)  
*Sets the PKHA function.*
  - static void LTC\_HAL\_PKHA\_ModeSetMontgomeryInput (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_montgomery_form_t` form)  
*Sets PKHA montgomery inputs.*
  - static void LTC\_HAL\_PKHA\_ModeSetMontgomeryOutput (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_montgomery_form_t` form)  
*Sets PKHA montgomery outputs.*
  - static void LTC\_HAL\_PKHA\_ModeSetF2M (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_f2m_t` form)  
*Sets the PKHA arithmetic type (f2m or integer).*
  - static void LTC\_HAL\_PKHA\_ModeSetR2 (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_r2_t` form)  
*Sets the PKHA use of R2 mod N.*
  - static void LTC\_HAL\_PKHA\_ModeSetTimingEqual (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_timing_t` form)  
*Sets the PKHA timing equalization.*
  - static void LTC\_HAL\_PKHA\_ModeSetOutput (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_output_reg_t` form)  
*Sets the PKHA output selection.*
  - static void LTC\_HAL\_PKHA\_ModeSetRamArea (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_reg_area_t` area)  
*Sets the PKHA RAM area selection.*
  - static void LTC\_HAL\_PKHA\_ModeSetQuadArea (`ltc_hal_mode_t` \*outMode, `ltc_hal_pkha_clr_quad_area_t` quad)  
*Sets the PKHA Quad area selection.*
  - static void LTC\_HAL\_WriteMode (LTC\_Type \*base, `ltc_hal_mode_t` mode)  
*LTC write mode register.*
  - static `ltc_hal_mode_t` LTC\_HAL\_ReadMode (LTC\_Type \*base)  
*LTC read mode register.*
  - static uint8\_t LTC\_HAL\_GetKeySize (LTC\_Type \*base)  
*Gets the LTC key size.*
  - `ltc_status_t` LTC\_HAL\_SetKeySize (LTC\_Type \*base, uint8\_t keySize)  
*Sets the LTC key size.*
  - static uint16\_t LTC\_HAL\_GetDataSize (LTC\_Type \*base)  
*Gets the LTC data size.*
  - `ltc_status_t` LTC\_HAL\_SetDataSize (LTC\_Type \*base, uint16\_t dataSize)  
*Sets the LTC data size.*
  - static uint8\_t LTC\_HAL\_GetICVSize (LTC\_Type \*base)  
*Gets the LTC ICV size.*

## LTC HAL driver

- `ltc_status_t LTC_HAL_SetICVSize` (LTC\_Type \*base, uint8\_t dataSize)  
*Sets the LTC ICV size.*
- static void `LTC_HAL_Command` (LTC\_Type \*base, ltc\_hal\_cmd\_t cmd)  
*Issues LTC commands.*
- static void `LTC_HAL_SetInterruptMask` (LTC\_Type \*base, ltc\_hal\_isr\_mask\_t mask)  
*Sets LTC Interrupt Masked.*
- static void `LTC_HAL_SetPKHAEnableDMA` (LTC\_Type \*base, ltc\_hal\_dma\_enable\_t enable)  
*Sets LTC DMA enable for PKHA.*
- static void `LTC_HAL_SetInputFIFOEnableDMA` (LTC\_Type \*base, ltc\_hal\_dma\_enable\_t enable)  
*Sets LTC DMA enable for input FIFO.*
- static void `LTC_HAL_SetInputFIFORequestSizeDMA` (LTC\_Type \*base, ltc\_hal\_fifo\_dma\_size\_t size)  
*Sets the LTC DMA input FIFO request size.*
- static void `LTC_HAL_SetOutputFIFOEnableDMA` (LTC\_Type \*base, ltc\_hal\_dma\_enable\_t enable)  
*Sets the LTC DMA enable for output FIFO.*
- static void `LTC_HAL_SetOutputFIFORequestSizeDMA` (LTC\_Type \*base, ltc\_hal\_fifo\_dma\_size\_t size)  
*Sets the LTC DMA output FIFO request size.*
- static void `LTC_HAL_SetInputFIFOByteSwap` (LTC\_Type \*base, ltc\_hal\_byte\_swap\_t swap)  
*Sets the LTC input FIFO byte swap.*
- static void `LTC_HAL_SetOutputFIFOByteSwap` (LTC\_Type \*base, ltc\_hal\_byte\_swap\_t swap)  
*Sets the LTC output FIFO byte swap.*
- static void `LTC_HAL_SetKeyRegInputByteSwap` (LTC\_Type \*base, ltc\_hal\_byte\_swap\_t swap)  
*Sets the LTC input key register byte swap.*
- static void `LTC_HAL_SetKeyRegOutputByteSwap` (LTC\_Type \*base, ltc\_hal\_byte\_swap\_t swap)  
*Sets the LTC output key register byte swap.*
- static void `LTC_HAL_SetCtxRegInputByteSwap` (LTC\_Type \*base, ltc\_hal\_byte\_swap\_t swap)  
*Sets the LTC input context register byte swap.*
- static void `LTC_HAL_SetCtxRegOutputByteSwap` (LTC\_Type \*base, ltc\_hal\_byte\_swap\_t swap)  
*Sets the LTC output context register byte swap.*
- static void `LTC_HAL_SetKeyRegAccessLock` (LTC\_Type \*base, ltc\_hal\_key\_lock\_t lock)  
*Sets the LTC key register access lock.*
- static void `LTC_HAL_ClearWritten` (LTC\_Type \*base, ltc\_hal\_clear\_written\_t clear)  
*Clears LTC internal registers.*
- static bool `LTC_HAL_GetStatusFlag` (LTC\_Type \*base, ltc\_hal\_status\_flag\_t flag)  
*Gets LTC status flags.*
- static void `LTC_HAL_ClearDoneInterruptStatus` (LTC\_Type \*base)  
*Clears the status done interrupt.*
- void `LTC_HAL_GetStatusFlagMasked` (LTC\_Type \*base, ltc\_hal\_status\_flag\_t in, ltc\_hal\_status\_flag\_t \*out)  
*Gets LTC masked status flags.*
- static bool `LTC_HAL_GetErrorStatusFlag` (LTC\_Type \*base, ltc\_hal\_error\_status\_flag\_t flag)  
*Gets LTC error status flags.*
- void `LTC_HAL_GetErrorStatusFlagMasked` (LTC\_Type \*base, ltc\_hal\_error\_status\_flag\_t in, ltc\_hal\_error\_status\_flag\_t \*out)  
*Gets LTC masked error status flags.*
- uint8\_t `LTC_HAL_GetAADSize` (LTC\_Type \*base, bool \*authOnly)  
*Gets the LTC AAD size.*
- void `LTC_HAL_SetAADSize` (LTC\_Type \*base, uint16\_t size, bool authOnly)  
*Sets the LTC AAD size.*

- `uint8_t LTC_HAL_GetIVSize` (LTC\_Type \*base, bool \*onlyIV)  
*Gets the LTC IV size.*
- `void LTC_HAL_SetIVSize` (LTC\_Type \*base, uint16\_t size, bool onlyIV)  
*Sets the LTC IV size.*
- `static void LTC_HAL_SetDPAMaskSeed` (LTC\_Type \*base, uint32\_t mask)  
*Sets the DPA mask seed value.*
- `ltc_status_t LTC_HAL_PKHA_SetASize` (LTC\_Type \*base, uint16\_t size)  
*Sets the PKHA A size.*
- `static uint16_t LTC_HAL_PKHA_GetASize` (LTC\_Type \*base)  
*Gets the PKHA A size.*
- `ltc_status_t LTC_HAL_PKHA_SetBSize` (LTC\_Type \*base, uint16\_t size)  
*Sets the PKHA B size.*
- `static uint16_t LTC_HAL_PKHA_GetBSize` (LTC\_Type \*base)  
*Gets the PKHA B size.*
- `ltc_status_t LTC_HAL_PKHA_SetNSize` (LTC\_Type \*base, uint16\_t size)  
*Sets the PKHA N size.*
- `static uint16_t LTC_HAL_PKHA_GetNSize` (LTC\_Type \*base)  
*Gets the PKHA N size.*
- `ltc_status_t LTC_HAL_PKHA_SetESize` (LTC\_Type \*base, uint16\_t size)  
*Sets the PKHA E size.*
- `static uint16_t LTC_HAL_PKHA_GetESize` (LTC\_Type \*base)  
*Gets the PKHA E size.*
- `ltc_status_t LTC_HAL_SetContext` (LTC\_Type \*base, const uint8\_t \*data, uint8\_t dataSize, uint8\_t startIndex)  
*Writes the LTC context register;.*
- `ltc_status_t LTC_HAL_GetContext` (LTC\_Type \*base, uint8\_t \*dest, uint8\_t dataSize, uint8\_t startIndex)  
*Reads the LTC context register.*
- `ltc_status_t LTC_HAL_SetKey` (LTC\_Type \*base, const uint8\_t \*key, uint8\_t keySize)  
*Sets the LTC keys.*
- `ltc_status_t LTC_HAL_GetKey` (LTC\_Type \*base, uint8\_t \*key, uint8\_t keySize)  
*Gets the LTC keys.*
- `static uint8_t LTC_HAL_InputFIFOGetLevel` (LTC\_Type \*base)  
*Gets the input FIFO level.*
- `static bool LTC_HAL_InputFIFOFull` (LTC\_Type \*base)  
*Gets the input FIFO level.*
- `static uint8_t LTC_HAL_OutputFIFOGetLevel` (LTC\_Type \*base)  
*Gets the output FIFO level.*
- `static bool LTC_HAL_OutputFIFOFull` (LTC\_Type \*base)  
*Gets the output FIFO level.*
- `static void LTC_HAL_WriteInputFIFO` (LTC\_Type \*base, uint32\_t data)  
*Writes data to input FIFO.*
- `static uint32_t LTC_HAL_ReadOutputFIFO` (LTC\_Type \*base)  
*Reads data from the output FIFO.*
- `static uint32_t LTC_HAL_GetStatusFIFO` (LTC\_Type \*base)  
*Reads data from the LTC FIFO Status register.*
- `ltc_status_t LTC_HAL_WritePKA` (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)  
*Writes data to the PKHA A register.*
- `ltc_status_t LTC_HAL_WriteSizedPKA` (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)

## LTC HAL driver

- Writes data and its size to the PKHA A register.*

  - void [LTC\\_HAL\\_ReadPKA](#) (LTC\_Type \*base, uint8\_t quad, uint8\_t \*data, uint16\_t dataSize)

*Reads data from the PKHA A register.*

  - [ltc\\_status\\_t LTC\\_HAL\\_WritePKB](#) (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)

*Writes data to the PKHA B register.*

  - [ltc\\_status\\_t LTC\\_HAL\\_WriteSizedPKB](#) (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)

*Writes data and its size to the PKHA B register.*

  - void [LTC\\_HAL\\_ReadPKB](#) (LTC\_Type \*base, uint8\_t quad, uint8\_t \*data, uint16\_t dataSize)

*Reads data from the PKHA B register.*

  - [ltc\\_status\\_t LTC\\_HAL\\_WritePKN](#) (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)

*Writes data to the PKHA N register.*

  - [ltc\\_status\\_t LTC\\_HAL\\_WriteSizedPKN](#) (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)

*Writes data and its size to the PKHA N register.*

  - void [LTC\\_HAL\\_ReadPKN](#) (LTC\_Type \*base, uint8\_t quad, uint8\_t \*data, uint16\_t dataSize)

*Reads data from the PKHA N register.*

  - [ltc\\_status\\_t LTC\\_HAL\\_WritePKE](#) (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)

*Writes data to the PKHA E register.*

  - [ltc\\_status\\_t LTC\\_HAL\\_WriteSizedPKE](#) (LTC\_Type \*base, uint8\_t quad, const uint8\_t \*data, uint16\_t dataSize)

*Writes data and its size to the PKHA E register.*

  - void [LTC\\_HAL\\_ReadPKE](#) (LTC\_Type \*base, uint8\_t quad, uint8\_t \*data, uint16\_t dataSize)

*Reads data from the PKHA E register.*

  - void [LTC\\_HAL\\_PKHA\\_ModeSetSrcRegCopy](#) ([ltc\\_hal\\_mode\\_t](#) \*outMode, [ltc\\_hal\\_pkha\\_reg\\_area\\_t](#) reg)

*Sets the PKHA copy source register.*

  - void [LTC\\_HAL\\_PKHA\\_ModeSetDstRegCopy](#) ([ltc\\_hal\\_mode\\_t](#) \*outMode, [ltc\\_hal\\_pkha\\_reg\\_area\\_t](#) reg)

*Sets the PKHA copy destination register.*

  - void [LTC\\_HAL\\_PKHA\\_ModeSetSrcSegCopy](#) ([ltc\\_hal\\_mode\\_t](#) \*outMode, [ltc\\_hal\\_pkha\\_quad\\_area\\_t](#) quad)

*Sets the PKHA copy source segment.*

  - void [LTC\\_HAL\\_PKHA\\_ModeSetDstSegCopy](#) ([ltc\\_hal\\_mode\\_t](#) \*outMode, [ltc\\_hal\\_pkha\\_quad\\_area\\_t](#) quad)

*Sets the PKHA copy destination segment.*

## 41.2.2 Data Structure Documentation

### 41.2.2.1 struct ltc\_hal\_pkha\_mode\_params\_t

## 41.2.3 Typedef Documentation

### 41.2.3.1 typedef uint32\_t ltc\_hal\_mode\_t

## 41.2.4 Enumeration Type Documentation

### 41.2.4.1 enum ltc\_status\_err\_shift\_t

Enumerator

*kStatus\_LTC\_ErrShift* Number of left shift bits for ltc\_status\_t General Error OR'ed with LTC Error Status Register ERRID1 value.

### 41.2.4.2 enum ltc\_status\_t

Enumerator

*kStatus\_LTC\_Error* General Error.

*kStatus\_LTC\_ModeError* Error Status Register: Mode Error.

*kStatus\_LTC\_DataSizeError* Error Status Register: Data Size Error, including PKHA N Register Size Error.

*kStatus\_LTC\_KeySizeError* Error Status Register: Key Size Error, including PKHA E Register Size Error.

*kStatus\_LTC\_PKHA\_RegASzError* Error Status Register: PKHA A Register Size Error.

*kStatus\_LTC\_PKHA\_RegBSzError* Error Status Register: PKHA B Register Size Error.

*kStatus\_LTC\_DataOutOfSeqError* Error Status Register: Data Arrived Out of Sequence Error.

*kStatus\_LTC\_PKHA\_DivByZeroError* Error Status Register: PKHA Divide By Zero Error.

*kStatus\_LTC\_PKHA\_ModulusEvenError* Error Status Register: PKHA Modulus Even Error.

*kStatus\_LTC\_DES\_KeyParityError* Error Status Register: DES Key Parity Error.

*kStatus\_LTC\_ICV\_CheckFailed* Error Status Register: ICV Check Failed (Received MAC compare failed)

*kStatus\_LTC\_InternalHwFailure* Error Status Register: Internal Hardware Failure.

*kStatus\_LTC\_CCM\_AadSzError* Error Status Register: CCM AAD Size Error.

*kStatus\_LTC\_CCM\_InvalidCryptoSel* Error Status Register: Invalid Crypto Engine Selected.

*kStatus\_LTC\_OSAError* OSA initialisation failed.

## LTC HAL driver

**41.2.4.3** enum `ltc_hal_algorithm_t`

**41.2.4.4** enum `ltc_hal_pkha_reg_area_t`

**41.2.4.5** enum `ltc_hal_pkha_clr_quad_area_t`

**41.2.4.6** enum `ltc_hal_pkha_quad_area_t`

**41.2.4.7** enum `ltc_hal_pkha_montgomery_form_t`

**41.2.4.8** enum `ltc_hal_pkha_f2m_t`

Enumerator

*kLTC\_PKHA\_Integer\_Arith* Use integer arithmetic.

*kLTC\_PKHA\_F2M\_Arith* Use binary polynomial arithmetic.

**41.2.4.9** enum `ltc_hal_pkha_r2_t`

Enumerator

*kLTC\_PKHA\_R2\_Calc* Calculate  $(R^2 \bmod N)$

*kLTC\_PKHA\_R2\_Input*  $(R^2 \bmod N)$  supplied as input

**41.2.4.10** enum `ltc_hal_pkha_timing_t`

**41.2.4.11** enum `ltc_hal_pkha_output_reg_t`

**41.2.4.12** enum `ltc_hal_pkha_func_t`

Enumerator

*kLTC\_PKHA\_Arith\_ModAdd*  $(A + B) \bmod N$

*kLTC\_PKHA\_Arith\_ModSub1*  $(A - B) \bmod N$

*kLTC\_PKHA\_Arith\_ModSub2*  $(B - A) \bmod N$

*kLTC\_PKHA\_Arith\_ModMul*  $(A \times B) \bmod N$

*kLTC\_PKHA\_Arith\_ModExp*  $(A^E) \bmod N$

*kLTC\_PKHA\_Arith\_ModRed*  $(A) \bmod N$

*kLTC\_PKHA\_Arith\_ModInv*  $(A^{-1}) \bmod N$

*kLTC\_PKHA\_Arith\_ECCAdd*  $(P1 + P2)$

*kLTC\_PKHA\_Arith\_ECCDouble*  $(P2 + P2)$

*kLTC\_PKHA\_Arith\_ECCMul*  $(E \times P1)$

*kLTC\_PKHA\_Arith\_ModR2*  $(R^2 \bmod N)$

*kLTC\_PKHA\_Arith\_GCD*  $\text{GCD}(A, N)$

*kLTC\_PKHA\_Arith\_PrimalityTest* Miller-Rabin.

**41.2.4.13** enum `ltc_hal_mode_encrypt_t`

**41.2.4.14** enum `ltc_hal_mode_icv_check_t`

**41.2.4.15** enum `ltc_hal_mode_algorithm_state_t`

**41.2.4.16** enum `ltc_hal_mode_symmetric_alg_t`

**41.2.4.17** enum `ltc_hal_cmd_t`

Enumerator

*kLTCCmd\_ResetAll* Reset all internal logic.

*kLTCCmd\_ResetAES* Reset AES core.

*kLTCCmd\_ResetDES* Reset DES core.

*kLTCCmd\_ResetPKHA* Reset PKHA core.

**41.2.4.18** enum `ltc_hal_key_lock_t`

Enumerator

*kLTCCtrl\_KeyRegisterReadable* Key register readable.

*kLTCCtrl\_KeyRegisterNotReadable* Key register not readable.

**41.2.4.19** enum `ltc_hal_byte_swap_t`

Enumerator

*kLTCCtrl\_ByteNoSwap* Don't swap bytes on read/write.

*kLTCCtrl\_ByteSwap* Swap bytes on read/write.

**41.2.4.20** enum `ltc_hal_fifo_dma_size_t`

Enumerator

*kLTCCtrl\_DMASize\_1byte* DMA request FIFO 1 entry.

*kLTCCtrl\_DMASize\_4byte* DMA request FIFO 4 entries.

**41.2.4.21** enum `ltc_hal_dma_enable_t`

Enumerator

*kLTCCtrl\_DMA\_Disabled* DMA disable.

*kLTCCtrl\_DMA\_Enabled* DMA enabled.

## LTC HAL driver

### 41.2.4.22 enum ltc\_hal\_isr\_mask\_t

Enumerator

*kLTCCtrl\_ISR\_Not\_Masked* Interrupt not masked.  
*kLTCCtrl\_ISR\_Masked* Interrupt masked.

### 41.2.4.23 enum ltc\_hal\_fifo\_status\_t

Enumerator

*kLTCFIFO\_OutputFifoFull* Output FIFO Full bit mask.  
*kLTCFIFO\_OutputFifoLevel* Output FIFO Level bit mask.  
*kLTCFIFO\_InputFifoFull* Input FIFO Full bit mask.  
*kLTCFIFO\_InputFifoLevel* Input FIFO Level bit mask.

## 41.2.5 Function Documentation

### 41.2.5.1 static uint32\_t LTC\_HAL\_GetWordFromUnaligned ( const uint8\_t \* src ) [inline], [static]

This function creates a 32-bit word from an input array of four bytes.

Parameters

|            |                                                                          |
|------------|--------------------------------------------------------------------------|
| <i>src</i> | Input array of four bytes. The array can start at any address in memory. |
|------------|--------------------------------------------------------------------------|

Returns

32-bit unsigned int created from the input byte array.

### 41.2.5.2 static void LTC\_HAL\_SetUnalignedFromWord ( uint32\_t srcWord, uint8\_t \* dst ) [inline], [static]

This function creates an output array of four bytes from an input 32-bit word.

Parameters

---

|                |                                                                           |
|----------------|---------------------------------------------------------------------------|
| <i>srcWord</i> | Input 32-bit unsigned integer.                                            |
| <i>dst</i>     | Output array of four bytes. The array can start at any address in memory. |

#### 41.2.5.3 void LTC\_HAL\_Init ( LTC\_Type \* base )

Initializes the LTC module to a known working state.

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | LTC module base pointer. |
|-------------|--------------------------|

#### 41.2.5.4 static void LTC\_HAL\_ModeSetAlgorithm ( ltc\_hal\_mode\_t \* outMode, ltc\_hal\_algorithm\_t alg ) [inline], [static]

This function sets the mode algorithm to use to switch between the major operating modes of PKHA, AES, DES, and 3DES. The value of this determines which way the mode register is interpreted, and should be set first before setting other mode settings.

Parameters

|                |                     |
|----------------|---------------------|
| <i>outMode</i> | Output mode word    |
| <i>alg</i>     | Algorithm to select |

#### 41.2.5.5 static void LTC\_HAL\_ModeSetEncrypt ( ltc\_hal\_mode\_t \* outMode, ltc\_hal\_mode\_encrypt\_t encrypt ) [inline], [static]

Sets the operating mode to encrypt or decrypt symmetric key algorithms.

Parameters

|                |                               |
|----------------|-------------------------------|
| <i>outMode</i> | Output mode word              |
| <i>encrypt</i> | Encrypt/decrypt mode selector |

#### 41.2.5.6 static ltc\_hal\_mode\_encrypt\_t LTC\_HAL\_ModeGetEncrypt ( ltc\_hal\_mode\_t \* outMode ) [inline], [static]

Gets the operating mode to encrypt or decrypt the symmetric key algorithms.

## LTC HAL driver

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
|----------------|------------------|

Returns

Encrypt/decrypt mode selector

**41.2.5.7 static void LTC\_HAL\_ModeSetICVTest ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_mode\_icv\_check\_t *check* ) [inline], [static]**

Sets the algorithm to perform or not perform ICV checking for all algorithms other than AES ECB.

Parameters

|                |                                  |
|----------------|----------------------------------|
| <i>outMode</i> | Output mode word                 |
| <i>check</i>   | Compare / Don't compare selector |

**41.2.5.8 static void LTC\_HAL\_ModeSetAlgorithmState ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_mode\_algorithm\_state\_t *as* ) [inline], [static]**

Sets the state of the algorithm to be executed.

Parameters

|                |                           |
|----------------|---------------------------|
| <i>outMode</i> | Output mode word          |
| <i>as</i>      | Algorithm state to select |

**41.2.5.9 static ltc\_hal\_mode\_algorithm\_state\_t LTC\_HAL\_ModeGetAlgorithmState ( ltc\_hal\_mode\_t \* *outMode* ) [inline], [static]**

Gets the state of the algorithm.

Returns

Algorithm state

**41.2.5.10 static void LTC\_HAL\_ModeSetSymmetricAlg ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_mode\_symmetric\_alg\_t *alg* ) [inline], [static]**

Sets the symmetric encryption/decryption operating mode.

Parameters

|                |                       |
|----------------|-----------------------|
| <i>outMode</i> | Output mode word      |
| <i>alg</i>     | Operation mode to use |

**41.2.5.11 static void LTC\_HAL\_ModeSetDecryptKey ( LTC\_Type \* *base* ) [inline], [static]**

Sets the LTC AES Mode DK bit to mark the key as decrypt key.

**41.2.5.12 static void LTC\_HAL\_PKHA\_ModeSetFunc ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_func\_t *func* ) [inline], [static]**

Sets the mathematics or memory function for the PKHA mode operation.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>func</i>    | Function to use  |

**41.2.5.13 static void LTC\_HAL\_PKHA\_ModeSetMontgomeryInput ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_montgomery\_form\_t *form* ) [inline], [static]**

Sets the LTC PKHA mode to use regular or montgomery-form inputs.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>form</i>    | Form to use      |

**41.2.5.14 static void LTC\_HAL\_PKHA\_ModeSetMontgomeryOutput ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_montgomery\_form\_t *form* ) [inline], [static]**

Sets the LTC PKHA mode to use regular or montgomery-form outputs.

Parameters

---

## LTC HAL driver

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>form</i>    | Form to use      |

**41.2.5.15** `static void LTC_HAL_PKHA_ModeSetF2M ( ltc_hal_mode_t * outMode, ltc_hal_pkha_f2m_t form ) [inline], [static]`

Sets the LTC PKHA mode to perform integer or f2m binary polynomial operations.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>form</i>    | Form to use      |

**41.2.5.16** `static void LTC_HAL_PKHA_ModeSetR2 ( ltc_hal_mode_t * outMode, ltc_hal_pkha_r2_t form ) [inline], [static]`

Sets the LTC PKHA mode to calculate or use the supplied R2 mod N inputs.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>form</i>    | Form to use      |

**41.2.5.17** `static void LTC_HAL_PKHA_ModeSetTimingEqual ( ltc_hal_mode_t * outMode, ltc_hal_pkha_timing_t form ) [inline], [static]`

Sets the LTC PKHA mode to use timing equalized version of functions or not.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>form</i>    | Form to use      |

**41.2.5.18** `static void LTC_HAL_PKHA_ModeSetOutput ( ltc_hal_mode_t * outMode, ltc_hal_pkha_output_reg_t form ) [inline], [static]`

Sets the LTC PKHA mode to output results in a particular destination register.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>form</i>    | Form to use      |

**41.2.5.19 static void LTC\_HAL\_PKHA\_ModeSetRamArea ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_reg\_area\_t *area* ) [inline], [static]**

Sets the LTC PKHA mode to clear a particular RAM area.

Parameters

|                |                    |
|----------------|--------------------|
| <i>outMode</i> | Output mode word   |
| <i>area</i>    | Ram area to clear. |

**41.2.5.20 static void LTC\_HAL\_PKHA\_ModeSetQuadArea ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_clr\_quad\_area\_t *quad* ) [inline], [static]**

Sets the LTC PKHA mode to clear a particular Quadrant area.

Parameters

|                |                     |
|----------------|---------------------|
| <i>outMode</i> | Output mode word    |
| <i>quad</i>    | Quad area to clear. |

**41.2.5.21 static void LTC\_HAL\_WriteMode ( LTC\_Type \* *base*, ltc\_hal\_mode\_t *mode* ) [inline], [static]**

The mode register can only be written all at once. Use the other LTC\_HAL\_ModeSet\* utility functions to construct the mode and then use this to write it to the hardware.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
| <i>mode</i> | Mode to set             |

## LTC HAL driver

**41.2.5.22** `static ltc_hal_mode_t LTC_HAL_ReadMode ( LTC_Type * base ) [inline], [static]`

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

**41.2.5.23** `static uint8_t LTC_HAL_GetKeySize ( LTC_Type * base ) [inline], [static]`

Returns the size in bytes of the key used for AES/DES operations.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Size of key in bytes

**41.2.5.24** `ltc_status_t LTC_HAL_SetKeySize ( LTC_Type * base, uint8_t keySize )`

Sets the size in bytes of the key being used for AES/DES operations.

Note

This should be called after the key itself is written because a write to this prevents writing the key.

Parameters

|                |                                   |
|----------------|-----------------------------------|
| <i>base</i>    | LTC module base pointer           |
| <i>keySize</i> | Size in bytes of the key to write |

Returns

LTC status

**41.2.5.25** `static uint16_t LTC_HAL_GetDataSize ( LTC_Type * base ) [inline], [static]`

Returns the size in bytes of the data being used for AES/DES operations.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Size of key in bytes

**41.2.5.26** `ltc_status_t LTC_HAL_SetDataSize ( LTC_Type * base, uint16_t dataSize )`

Sets the size in bytes of the data being used for AES/DES operations.

Parameters

|                 |                                                                  |
|-----------------|------------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                          |
| <i>dataSize</i> | Size in bytes of the data that will be written to the input FIFO |

Returns

LTC status

**41.2.5.27** `static uint8_t LTC_HAL_GetICVSize ( LTC_Type * base ) [inline], [static]`

Returns the size in bytes of data in the last block of ICV (integrity check value) is valid when performing AES integrity checks.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Size of valid ICV data in bytes

**41.2.5.28** `ltc_status_t LTC_HAL_SetICVSize ( LTC_Type * base, uint8_t dataSize )`

Sets the size in bytes of data that is valid in the last block ICV (integrity check value).

## LTC HAL driver

### Parameters

|                 |                                     |
|-----------------|-------------------------------------|
| <i>base</i>     | LTC module base pointer             |
| <i>dataSize</i> | Size in bytes of the valid ICV data |

### Returns

LTC status

**41.2.5.29** `static void LTC_HAL_Command ( LTC_Type * base, ltc_hal_cmd_t cmd ) [inline], [static]`

Issues LTC commands to reset the module or submodules.

### Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
| <i>cmd</i>  | Command to issue.       |

**41.2.5.30** `static void LTC_HAL_SetInterruptMask ( LTC_Type * base, ltc_hal_isr_mask_t mask ) [inline], [static]`

### Note

After this bit is set, it can only be cleared by hard reset.

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | LTC module base pointer  |
| <i>mask</i> | ISR mask/no mask setting |

**41.2.5.31** `static void LTC_HAL_SetPKHAEnableDMA ( LTC_Type * base, ltc_hal_dma_enable_t enable ) [inline], [static]`

Enables/disables DMA request and done signals for PKHA.

Parameters

|               |                         |
|---------------|-------------------------|
| <i>base</i>   | LTC module base pointer |
| <i>enable</i> | Enable/disable DMA      |

**41.2.5.32 static void LTC\_HAL\_SetInputFIFOEnableDMA ( LTC\_Type \* *base*,  
ltc\_hal\_dma\_enable\_t *enable* ) [inline], [static]**

Enables/disables the DMA request and done signals for input FIFO.

Parameters

|               |                         |
|---------------|-------------------------|
| <i>base</i>   | LTC module base pointer |
| <i>enable</i> | Enable/disable DMA      |

**41.2.5.33 static void LTC\_HAL\_SetInputFIFORequestSizeDMA ( LTC\_Type \* *base*,  
ltc\_hal\_fifo\_dma\_size\_t *size* ) [inline], [static]**

Input FIFO only requests data if the input FIFO has enough space for the request size.

Parameters

|             |                                             |
|-------------|---------------------------------------------|
| <i>base</i> | LTC module base pointer                     |
| <i>size</i> | Input FIFO DMA request size of 1 or 4 bytes |

**41.2.5.34 static void LTC\_HAL\_SetOutputFIFOEnableDMA ( LTC\_Type \* *base*,  
ltc\_hal\_dma\_enable\_t *enable* ) [inline], [static]**

Enables/disables the DMA request and done signals for output FIFO.

Parameters

|               |                         |
|---------------|-------------------------|
| <i>base</i>   | LTC module base pointer |
| <i>enable</i> | Enable/disable DMA      |

**41.2.5.35 static void LTC\_HAL\_SetOutputFIFORequestSizeDMA ( LTC\_Type \* *base*,  
ltc\_hal\_fifo\_dma\_size\_t *size* ) [inline], [static]**

Input FIFO only requests data if the output FIFO has enough space for the request size.

## LTC HAL driver

Parameters

|             |                                              |
|-------------|----------------------------------------------|
| <i>base</i> | LTC module base pointer                      |
| <i>size</i> | Output FIFO DMA request size of 1 or 4 bytes |

**41.2.5.36** `static void LTC_HAL_SetInputFIFOByteSwap ( LTC_Type * base,  
ltc_hal_byte_swap_t swap ) [inline], [static]`

Sets whether the input FIFO should byte swap all data written to.

Parameters

|             |                            |
|-------------|----------------------------|
| <i>base</i> | LTC module base pointer    |
| <i>swap</i> | Input FIFO byte swap value |

**41.2.5.37** `static void LTC_HAL_SetOutputFIFOByteSwap ( LTC_Type * base,  
ltc_hal_byte_swap_t swap ) [inline], [static]`

Sets whether the output FIFO should byte swap all data read from.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | LTC module base pointer     |
| <i>swap</i> | Output FIFO byte swap value |

**41.2.5.38** `static void LTC_HAL_SetKeyRegInputByteSwap ( LTC_Type * base,  
ltc_hal_byte_swap_t swap ) [inline], [static]`

Sets whether the key register should byte swap all data written to. Data is byte-swapped only within a single word.

Parameters

|             |                                    |
|-------------|------------------------------------|
| <i>base</i> | LTC module base pointer            |
| <i>swap</i> | Input key register byte swap value |

**41.2.5.39 static void LTC\_HAL\_SetKeyRegOutputByteSwap ( LTC\_Type \* *base*,  
ltc\_hal\_byte\_swap\_t *swap* ) [inline], [static]**

Sets whether the key register should byte swap all data read from. Data is byte-swapped only within a single word.

Parameters

|             |                                     |
|-------------|-------------------------------------|
| <i>base</i> | LTC module base pointer             |
| <i>swap</i> | Output key register byte swap value |

**41.2.5.40 static void LTC\_HAL\_SetCtxRegInputByteSwap ( LTC\_Type \* *base*,  
ltc\_hal\_byte\_swap\_t *swap* ) [inline], [static]**

Sets whether the context register should byte swap all data written to. Data is byte-swapped only within a single word.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | LTC module base pointer                |
| <i>swap</i> | Input context register byte swap value |

**41.2.5.41 static void LTC\_HAL\_SetCtxRegOutputByteSwap ( LTC\_Type \* *base*,  
ltc\_hal\_byte\_swap\_t *swap* ) [inline], [static]**

Sets whether the context register should byte swap all data read from. Data is byte-swapped only within a single word.

Parameters

|             |                                         |
|-------------|-----------------------------------------|
| <i>base</i> | LTC module base pointer                 |
| <i>swap</i> | Output context register byte swap value |

**41.2.5.42 static void LTC\_HAL\_SetKeyRegAccessLock ( LTC\_Type \* *base*,  
ltc\_hal\_key\_lock\_t *lock* ) [inline], [static]**

Sets read access to the LTC key register.

## LTC HAL driver

Parameters

|             |                                     |
|-------------|-------------------------------------|
| <i>base</i> | LTC module base pointer             |
| <i>swap</i> | lock Key register read access value |

**41.2.5.43 static void LTC\_HAL\_ClearWritten ( LTC\_Type \* *base*, ltc\_hal\_clear\_written\_t *clear* ) [inline], [static]**

This function clears various internal registers of the LTC to reset components to a known state.

Parameters

|              |                         |
|--------------|-------------------------|
| <i>base</i>  | LTC module base pointer |
| <i>clear</i> | Submodule to be cleared |

**41.2.5.44 static bool LTC\_HAL\_GetStatusFlag ( LTC\_Type \* *base*, ltc\_hal\_status\_flag\_t *flag* ) [inline], [static]**

Returns the status of a single or multiple status flags. The return value is only true if at least one of the selected flags are true.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
| <i>flag</i> | Status flag to check    |

Returns

bool Status flag true/false

**41.2.5.45 static void LTC\_HAL\_ClearDoneInterruptStatus ( LTC\_Type \* *base* ) [inline], [static]**

This function clears the interrupt flag that signals an operation has completed, so it can be reasserted on a subsequent operation.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

**41.2.5.46 void LTC\_HAL\_GetStatusFlagMasked ( LTC\_Type \* *base*, ltc\_hal\_status\_flag\_t *in*, ltc\_hal\_status\_flag\_t \* *out* )**

Returns the status of each individual flag requested.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
| <i>in</i>   | Status flags to check   |
| <i>out</i>  | Output status flags set |

**41.2.5.47 static bool LTC\_HAL\_GetErrorStatusFlag ( LTC\_Type \* *base*, ltc\_hal\_error\_status\_flag\_t *flag* ) [inline], [static]**

Returns the status of a single or multiple error status flags. The return value is only true if all selected flags are true.

Parameters

|             |                            |
|-------------|----------------------------|
| <i>base</i> | LTC module base pointer    |
| <i>flag</i> | Error status flag to check |

Returns

bool Error status flag true/false

**41.2.5.48 void LTC\_HAL\_GetErrorStatusFlagMasked ( LTC\_Type \* *base*, ltc\_hal\_error\_status\_flag\_t *in*, ltc\_hal\_error\_status\_flag\_t \* *out* )**

Returns the error status of each individual flag requested.

Parameters

---

## LTC HAL driver

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | LTC module base pointer       |
| <i>flag</i> | Error status flag to check    |
| <i>in</i>   | Error status flags to check   |
| <i>out</i>  | Output error status flags set |

### 41.2.5.49 uint8\_t LTC\_HAL\_GetAADSize ( LTC\_Type \* *base*, bool \* *authOnly* )

Returns the size in bytes (mod 16) of how much of the last block of AAD is valid.

Parameters

|                 |                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                                                                                              |
| <i>authOnly</i> | Output parameter to store whether or not only AAD data is to be written to the FIFO, meaning only authentication is being performed. |

Returns

Size of the AAD, mod 16

### 41.2.5.50 void LTC\_HAL\_SetAADSize ( LTC\_Type \* *base*, uint16\_t *size*, bool *authOnly* )

Sets the size of the AAD to be written. This data is added to the data size register, which is the AAD size rounded up to the next 16-byte boundary. If the 'authOnly' flag is set, it tells the engine that *only* authentication is performed which means only AAD data is written into the input FIFO.

Parameters

|                 |                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                                                                    |
| <i>Size</i>     | Size in bytes of the AAD data                                                                              |
| <i>authOnly</i> | Whether or not only AAD data is to be written to the FIFO, meaning only authentication is being performed. |

### 41.2.5.51 uint8\_t LTC\_HAL\_GetIVSize ( LTC\_Type \* *base*, bool \* *onlyIV* )

Returns the size in bytes (mod 16) of how much of the last block of IV is valid.

Parameters

|               |                                                                                     |
|---------------|-------------------------------------------------------------------------------------|
| <i>base</i>   | LTC module base pointer                                                             |
| <i>onlyIV</i> | Output parameter to store whether or not only IV data is to be written to the FIFO. |

Returns

Size of the IV, mod 16

**41.2.5.52 void LTC\_HAL\_SetIVSize ( LTC\_Type \* *base*, uint16\_t *size*, bool *onlyIV* )**

Sets the size of the IV to be written. This data is added to the data size register, which is the IV size rounded up to the next 16-byte boundary.

Parameters

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>base</i>   | LTC module base pointer                                  |
| <i>Size</i>   | Size in bytes (mod 16) of the IV data                    |
| <i>onlyIV</i> | Whether or not only IV data is to be written to the FIFO |

Returns

LTC status

**41.2.5.53 static void LTC\_HAL\_SetDPAMaskSeed ( LTC\_Type \* *base*, uint32\_t *mask* )  
[inline], [static]**

The differential power analysis (DPA) needs a seed mask to introduce noise into the power consumed by the AES module. This should be seeded at least at POR but preferably every 100 k AES blocks processed to provide DPA protection.

Parameters

|             |                            |
|-------------|----------------------------|
| <i>base</i> | LTC module base pointer    |
| <i>mask</i> | Random DPA mask seed value |

## LTC HAL driver

### 41.2.5.54 `ltc_status_t LTC_HAL_PKHA_SetASize ( LTC_Type * base, uint16_t size )`

Sets the size in bytes of data contained in the PKHA A register.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | LTC module base pointer     |
| <i>size</i> | Size in bytes (maximum 256) |

### 41.2.5.55 `static uint16_t LTC_HAL_PKHA_GetASize ( LTC_Type * base ) [inline], [static]`

Returns the size in bytes of data contained in the PKHA A register.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Size in bytes

### 41.2.5.56 `ltc_status_t LTC_HAL_PKHA_SetBSize ( LTC_Type * base, uint16_t size )`

Sets the size in bytes of data contained in the PKHA B register.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | LTC module base pointer     |
| <i>size</i> | Size in bytes (maximum 256) |

### 41.2.5.57 `static uint16_t LTC_HAL_PKHA_GetBSize ( LTC_Type * base ) [inline], [static]`

Returns the size in bytes of data contained in the PKHA B register.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Size in bytes

#### 41.2.5.58 `ltc_status_t LTC_HAL_PKHA_SetNSize ( LTC_Type * base, uint16_t size )`

Sets the size in bytes of data contained in the PKHA N register.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | LTC module base pointer     |
| <i>size</i> | Size in bytes (maximum 256) |

#### 41.2.5.59 `static uint16_t LTC_HAL_PKHA_GetNSize ( LTC_Type * base ) [inline], [static]`

Returns the size in bytes of data contained in the PKHA N register.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Size in bytes

#### 41.2.5.60 `ltc_status_t LTC_HAL_PKHA_SetESize ( LTC_Type * base, uint16_t size )`

Sets the size in bytes of data contained in the PKHA E register.

Parameters

---

## LTC HAL driver

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | LTC module base pointer     |
| <i>size</i> | Size in bytes (maximum 256) |

### 41.2.5.61 `static uint16_t LTC_HAL_PKHA_GetESize ( LTC_Type * base ) [inline], [static]`

Returns the size in bytes of data contained in the PKHA E register.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Size in bytes

### 41.2.5.62 `ltc_status_t LTC_HAL_SetContext ( LTC_Type * base, const uint8_t * data, uint8_t dataSize, uint8_t startIndex )`

The LTC context register is a 512 bit (64 byte) register that holds internal context for the crypto engine. The meaning varies based on the algorithm and operating state being used. This register is written by the driver/application to load state such as IV, counter, and so on. Then, it is updated by the internal crypto engine as needed.

Parameters

|                   |                                                         |
|-------------------|---------------------------------------------------------|
| <i>base</i>       | LTC module base pointer                                 |
| <i>data</i>       | Data to write                                           |
| <i>dataSize</i>   | Size of data to write in bytes                          |
| <i>startIndex</i> | Starting word (4-byte) index into the 16-word register. |

Returns

Status of write

### 41.2.5.63 `ltc_status_t LTC_HAL_GetContext ( LTC_Type * base, uint8_t * dest, uint8_t dataSize, uint8_t startIndex )`

The LTC context register is a 512 bit (64 byte) register that holds internal context for the crypto engine. The meaning varies based on the algorithm and operating state being used. This register is written by the driver/application to load state such as IV, counter, and so on. Then, it is updated by the internal crypto engine as needed.

Parameters

|                   |                                                         |
|-------------------|---------------------------------------------------------|
| <i>base</i>       | LTC module base pointer                                 |
| <i>data</i>       | Destination of read data                                |
| <i>dataSize</i>   | Size of data to read in bytes                           |
| <i>startIndex</i> | Starting word (4-byte) index into the 16-word register. |

Returns

Status of read

**41.2.5.64** `ltc_status_t LTC_HAL_SetKey ( LTC_Type * base, const uint8_t * key, uint8_t keySize )`

This function writes the LTC keys into the key register. The keys should be written before the key size.

Parameters

|                |                                                                                  |
|----------------|----------------------------------------------------------------------------------|
| <i>base</i>    | LTC module base pointer                                                          |
| <i>key</i>     | Array of key words                                                               |
| <i>keySize</i> | Number of bytes for all keys to be loaded (maximum 32, must be a multiple of 4). |

Returns

Key set status

**41.2.5.65** `ltc_status_t LTC_HAL_GetKey ( LTC_Type * base, uint8_t * key, uint8_t keySize )`

This function retrieves the LTC keys from the key register.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | LTC module base pointer     |
| <i>key</i>  | Array of data to store keys |

## LTC HAL driver

|                |                                     |
|----------------|-------------------------------------|
| <i>keySize</i> | Number of bytes of keys to retrieve |
|----------------|-------------------------------------|

Returns

Key set status

**41.2.5.66** `static uint8_t LTC_HAL_InputFIFOGetLevel ( LTC_Type * base ) [inline], [static]`

Returns the number of entries currently in the input FIFO.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Input FIFO entries

**41.2.5.67** `static bool LTC_HAL_InputFIFOFull ( LTC_Type * base ) [inline], [static]`

Returns the number of entries currently in the input FIFO.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Input FIFO entries

**41.2.5.68** `static uint8_t LTC_HAL_OutputFIFOGetLevel ( LTC_Type * base ) [inline], [static]`

Returns the number of entries currently in the output FIFO.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Output FIFO entries

**41.2.5.69 static bool LTC\_HAL\_OutputFIFOFull ( LTC\_Type \* *base* ) [inline], [static]**

Returns the number of entries currently in the output FIFO.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Output FIFO entries

**41.2.5.70 static void LTC\_HAL\_WriteInputFIFO ( LTC\_Type \* *base*, uint32\_t *data* ) [inline], [static]**

Writes a word of data to the input FIFO for algorithm processing.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
| <i>data</i> | Data to write           |

**41.2.5.71 static uint32\_t LTC\_HAL\_ReadOutputFIFO ( LTC\_Type \* *base* ) [inline], [static]**

Reads a word of data from the output FIFO after algorithm processing.

Parameters

---

## LTC HAL driver

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Data read

**41.2.5.72** `static uint32_t LTC_HAL_GetStatusFIFO ( LTC_Type * base ) [inline], [static]`

Reads LTC FIFO Status register actual value.

Parameters

|             |                         |
|-------------|-------------------------|
| <i>base</i> | LTC module base pointer |
|-------------|-------------------------|

Returns

Data read

**41.2.5.73** `ltc_status_t LTC_HAL_WritePKA ( LTC_Type * base, uint8_t quad, const uint8_t * data, uint16_t dataSize )`

Writes data in byte-sized chunks to the PKHA A register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero.

Parameters

|                 |                                                             |
|-----------------|-------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                     |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers. |
| <i>data</i>     | Array of bytes to be written                                |
| <i>dataSize</i> | Size of data to be written in bytes                         |

Returns

Status

**41.2.5.74** `ltc_status_t LTC_HAL_WriteSizedPKA ( LTC_Type * base, uint8_t quad, const uint8_t * data, uint16_t dataSize )`

Writes data in byte-sized chunks to the PKHA A register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero. Also write data size to PKASZ register.

Parameters

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                      |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers.  |
| <i>data</i>     | Array of bytes to be written                                 |
| <i>dataSize</i> | Size of data to be written in bytes and stored in PKASZ reg. |

Returns

Status

**41.2.5.75 void LTC\_HAL\_ReadPKA ( LTC\_Type \* *base*, uint8\_t *quad*, uint8\_t \* *data*, uint16\_t *dataSize* )**

Reads data in byte-sized chunks from PKHA A register, which is 2048 bits in size.

Parameters

|                 |                                                                                      |
|-----------------|--------------------------------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                                              |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers.                          |
| <i>data</i>     | Array of bytes to be read into. This must be large enough to store 'dataSize' bytes. |
| <i>dataSize</i> | Size of data to be read, in bytes                                                    |

**41.2.5.76 ltc\_status\_t LTC\_HAL\_WritePKB ( LTC\_Type \* *base*, uint8\_t *quad*, const uint8\_t \* *data*, uint16\_t *dataSize* )**

Writes data in byte-sized chunks to PKHA B register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero.

Parameters

|             |                                                             |
|-------------|-------------------------------------------------------------|
| <i>base</i> | LTC module base pointer                                     |
| <i>quad</i> | Quadrant in register (0 - 3) to refer to the sub-registers. |
| <i>data</i> | Array of bytes to be written                                |

## LTC HAL driver

|                 |                                     |
|-----------------|-------------------------------------|
| <i>dataSize</i> | Size of data to be written in bytes |
|-----------------|-------------------------------------|

Returns

Status

### 41.2.5.77 `ltc_status_t LTC_HAL_WriteSizedPKB ( LTC_Type * base, uint8_t quad, const uint8_t * data, uint16_t dataSize )`

Writes data in byte-sized chunks to PKHA B register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero. Also write data size to PKBSZ register.

Parameters

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                      |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers.  |
| <i>data</i>     | Array of bytes to be written                                 |
| <i>dataSize</i> | Size of data to be written in bytes and stored in PKBSZ reg. |

Returns

Status

### 41.2.5.78 `void LTC_HAL_ReadPKB ( LTC_Type * base, uint8_t quad, uint8_t * data, uint16_t dataSize )`

Reads data in byte-sized chunks from PKHA B register, which is 2048 bits in size.

Parameters

|                 |                                                                                      |
|-----------------|--------------------------------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                                              |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers.                          |
| <i>data</i>     | Array of bytes to be read into. This must be large enough to store 'dataSize' bytes. |
| <i>dataSize</i> | Size of data to be read, in bytes                                                    |

**41.2.5.79** `ltc_status_t LTC_HAL_WritePKN ( LTC_Type * base, uint8_t quad, const uint8_t * data, uint16_t dataSize )`

Writes data in byte-sized chunks to PKHA N register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero.

Parameters

|                 |                                                             |
|-----------------|-------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                     |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers. |
| <i>data</i>     | Array of bytes to be written                                |
| <i>dataSize</i> | Size of data to be written in bytes                         |

Returns

Status

**41.2.5.80** `ltc_status_t LTC_HAL_WriteSizedPKN ( LTC_Type * base, uint8_t quad, const uint8_t * data, uint16_t dataSize )`

Writes data in byte-sized chunks to the PKHA N register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero. Also write data size to PKNSZ register.

Parameters

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                      |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers.  |
| <i>data</i>     | Array of bytes to be written                                 |
| <i>dataSize</i> | Size of data to be written in bytes and stored in PKNSZ reg. |

Returns

Status

**41.2.5.81** `void LTC_HAL_ReadPKN ( LTC_Type * base, uint8_t quad, uint8_t * data, uint16_t dataSize )`

Reads data in byte-sized chunks from PKHA N register, which is 2048 bits in size.

## LTC HAL driver

### Parameters

|                 |                                                                                      |
|-----------------|--------------------------------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                                              |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers.                          |
| <i>data</i>     | Array of bytes to be read into. This must be large enough to store 'dataSize' bytes. |
| <i>dataSize</i> | Size of data to be read, in bytes                                                    |

#### 41.2.5.82 ***ltc\_status\_t* LTC\_HAL\_WritePKE ( LTC\_Type \* *base*, uint8\_t *quad*, const uint8\_t \* *data*, uint16\_t *dataSize* )**

Writes data in byte-sized chunks to PKHA E register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero.

### Parameters

|                 |                                                             |
|-----------------|-------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                     |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers. |
| <i>data</i>     | Array of bytes to be written                                |
| <i>dataSize</i> | Size of data to be written in bytes                         |

### Returns

Status

#### 41.2.5.83 ***ltc\_status\_t* LTC\_HAL\_WriteSizedPKE ( LTC\_Type \* *base*, uint8\_t *quad*, const uint8\_t \* *data*, uint16\_t *dataSize* )**

Writes data in byte-sized chunks to PKHA E register, which is 2048 bits in size. This register can only be written when the mode register is not set for PKHA operation. Otherwise, reads and writes return zero. Also write data size to PKESZ register.

### Parameters

|             |                                                             |
|-------------|-------------------------------------------------------------|
| <i>base</i> | LTC module base pointer                                     |
| <i>quad</i> | Quadrant in register (0 - 3) to refer to the sub-registers. |

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>data</i>     | Array of bytes to be written                                 |
| <i>dataSize</i> | Size of data to be written in bytes and stored in PKESZ reg. |

Returns

Status

**41.2.5.84 void LTC\_HAL\_ReadPKE ( LTC\_Type \* *base*, uint8\_t *quad*, uint8\_t \* *data*, uint16\_t *dataSize* )**

Reads data in byte-sized chunks from PKHA E register, which is 2048 bits in size.

Parameters

|                 |                                                                                      |
|-----------------|--------------------------------------------------------------------------------------|
| <i>base</i>     | LTC module base pointer                                                              |
| <i>quad</i>     | Quadrant in register (0 - 3) to refer to the sub-registers.                          |
| <i>data</i>     | Array of bytes to be read into. This must be large enough to store 'dataSize' bytes. |
| <i>dataSize</i> | Size of data to be read, in bytes                                                    |

**41.2.5.85 void LTC\_HAL\_PKHA\_ModeSetSrcRegCopy ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_reg\_area\_t *reg* )**

Sets the LTC PKHA source register to perform register copy.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>reg</i>     | Register to use  |

**41.2.5.86 void LTC\_HAL\_PKHA\_ModeSetDstRegCopy ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_reg\_area\_t *reg* )**

Sets the LTC PKHA destination register to perform register copy.

Parameters

---

## LTC HAL driver

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>reg</i>     | Register to use  |

**41.2.5.87** void LTC\_HAL\_PKHA\_ModeSetSrcSegCopy ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_quad\_area\_t *quad* )

Sets the LTC PKHA source segment to perform register copy.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>reg</i>     | Register to use  |

**41.2.5.88** void LTC\_HAL\_PKHA\_ModeSetDstSegCopy ( ltc\_hal\_mode\_t \* *outMode*, ltc\_hal\_pkha\_quad\_area\_t *quad* )

Sets the LTC PKHA destination segment to perform register copy.

Parameters

|                |                  |
|----------------|------------------|
| <i>outMode</i> | Output mode word |
| <i>reg</i>     | Register to use  |

## 41.2.6 LTC HASH driver

### 41.2.6.1 Overview

This section describes the programming interface of the LTC HASH driver.

#### Data Structures

- union `ltc_drv_hash_block`  
*16-byte block represented as byte array or four 32-bit words [More...](#)*
- struct `ltc_drv_hash_ctx`  
*Data structure with hash context. [More...](#)*

#### Enumerations

- enum `ltc_drv_hash_algo_state` {  
`kLtcHashInit` = 1u,  
`kLtcHashUpdate` }  
*Internal states of the HASH creation process.*
- enum `ltc_drv_hash_algo` {  
`kLtcXcbcMac` = kLTCMode\_XCBC\_MAC,  
`kLtcCMAC` = kLTCMode\_CMAC }  
*Supported cryptographic block cipher functions for HASH creation.*
- enum `ltc_drv_hash_ctx_indexes` {  
`kLtcHashCtxKeyStartIdx` = 12,  
`kLtcHashCtxKeySize` = 20,  
`kLtcHashCtxNumWords` = 21 }  
*Definitions of indexes into hash context array.*

#### Functions

- `ltc_status_t LTC_DRV_hash_init` (uint32\_t instance, `ltc_drv_hash_ctx` \*ctx, `ltc_drv_hash_algo` algo, const uint8\_t \*key, uint32\_t keySize)  
*Initialize HASH context.*
- `ltc_status_t LTC_DRV_hash_update` (`ltc_drv_hash_ctx` \*ctx, const uint8\_t \*input, uint32\_t inputSize)  
*Add data to current HASH.*
- `ltc_status_t LTC_DRV_hash_finish` (`ltc_drv_hash_ctx` \*ctx, uint8\_t \*output, uint32\_t \*outputSize)  
*Finalize hashing.*
- `ltc_status_t LTC_DRV_hash` (uint32\_t instance, `ltc_drv_hash_algo` algo, const uint8\_t \*input, uint32\_t inputSize, const uint8\_t \*key, uint32\_t keySize, uint8\_t \*output, uint32\_t \*outputSize)  
*Create HASH on given data.*

## LTC HAL driver

### 41.2.6.2 Data Structure Documentation

#### 41.2.6.2.1 union ltc\_drv\_hash\_block

##### Data Fields

- `uint8_t b [16]`  
*byte array*
- `uint32_t w [4]`  
*array of 32-bit words*

#### 41.2.6.2.2 struct ltc\_drv\_hash\_ctx

XCBC-MAC needs to store 48 bytes of context (MAC, K2 and K3) between message chunks processing.

CMAC needs less (32 bytes) of context (MAC and L) between message chunks processing.

In both modes, also the derived AES key must be restored from the context.

If state of the hash software process is `kLtcCmacInit`, the context is defined as follows

`word[20] = key_size = word[kLtcCmacCtxKeySize]`

`word[12-19] = init key`

If state of the hash software process is `kLtcCmacUpdate`, the context for `kLtcXcbcMac` hash is defined as follows

`word[0-3] = mac`

`word[3-7] = k3`

`word[8-11] = k2`

`word[12-19] = k1`

`word[20] = key_size = word[kLtcCmacCtxKeySize]`

If state of the hash software process is `kLtcCmacUpdate`, the context for `kLtcCMAC` hash is defined as follows

`word[0-3] = mac`

`word[3-7] = L`

`word[12-19] = k1`

`word[20] = key_size = word[kLtcCmacCtxKeySize]`

During hash updates we only process 16-byte blocks. If we have less data then keep them only in context. The 'blk' memory buffer is flushed to LTC during hash finish.

##### Data Fields

- `ltc_drv_hash_block blk`

- *memory buffer.*
- `uint32_t blksz`  
*number of valid bytes in memory buffer*
- `uint32_t instance`  
*LTC module instance number.*
- `ltc_drv_hash_algo algo`  
*selected algorithm from the set of supported algorithms in `ltc_drv_hash_algo`*
- `ltc_drv_hash_algo_state state`  
*finite machine state of the hash software process*
- `uint32_t word [kLtcHashCtxNumWords]`  
*LTC module context that needs to be saved/restored between LTC jobs.*

#### 41.2.6.2.2.1 Field Documentation

##### 41.2.6.2.2.1.1 `ltc_drv_hash_block ltc_drv_hash_ctx::blk`

only full 16-byte blocks are written to LTC during hash updates

#### 41.2.6.3 Enumeration Type Documentation

##### 41.2.6.3.1 `enum ltc_drv_hash_algo_state`

Enumerator

***kLtcHashInit*** Key in the HASH context is the input key.

***kLtcHashUpdate*** HASH context has algorithm specific context: MAC, K2 and K3 (XCBC-MAC) or MAC and L (CMAC). Key in the HASH context is the derived key.

##### 41.2.6.3.2 `enum ltc_drv_hash_algo`

Enumerator

***kLtcXcbcMac*** XCBC-MAC (AES engine)

***kLtcCMAC*** CMAC (AES engine)

##### 41.2.6.3.3 `enum ltc_drv_hash_ctx_indexes`

Enumerator

***kLtcHashCtxKeyStartIdx*** context word array index where key is stored

***kLtcHashCtxKeySize*** context word array index where key size is stored

***kLtcHashCtxNumWords*** number of context array 32-bit words

## LTC HAL driver

### 41.2.6.4 Function Documentation

#### 41.2.6.4.1 `ltc_status_t LTC_DRV_hash_init ( uint32_t instance, ltc_drv_hash_ctx * ctx, ltc_drv_hash_algo algo, const uint8_t * key, uint32_t keySize )`

This function initialize the HASH with a given key, and selects a block cipher to use.

For XCBC-MAC, the key length must be 16. For CMAC, the key length can be the AES key lengths supported by AES engine.

Parameters

|     |                 |                                                 |
|-----|-----------------|-------------------------------------------------|
|     | <i>instance</i> | LTC module instance number.                     |
| out | <i>ctx</i>      | Output hash context                             |
|     | <i>algo</i>     | Block cipher algorithm to use for HASH creation |
|     | <i>key</i>      | Input key                                       |
|     | <i>keySize</i>  | Size of input key in bytes                      |

Returns

0 on succes, or `kFSLCryptErrInvalidKeyLength`

#### 41.2.6.4.2 `ltc_status_t LTC_DRV_hash_update ( ltc_drv_hash_ctx * ctx, const uint8_t * input, uint32_t inputSize )`

Add data to current HASH. This can be called repeatedly with an arbitrary amount of data to be hashed.

Parameters

|         |                  |                             |
|---------|------------------|-----------------------------|
| in, out | <i>ctx</i>       | HASH context                |
|         | <i>input</i>     | Input data                  |
|         | <i>inputSize</i> | Size of input data in bytes |

Returns

Status of the hash update operation

#### 41.2.6.4.3 `ltc_status_t LTC_DRV_hash_finish ( ltc_drv_hash_ctx * ctx, uint8_t * output, uint32_t * outputSize )`

Outputs the final hash and erases the context.

Parameters

|                |                   |                                                           |
|----------------|-------------------|-----------------------------------------------------------|
| <i>in, out</i> | <i>ctx</i>        | Input hash context                                        |
| <i>out</i>     | <i>output</i>     | Output hash data                                          |
| <i>out</i>     | <i>outputSize</i> | Output param storing the size of the output hash in bytes |

Returns

Status of the hash finish operation

**41.2.6.4.4** `ltc_status_t LTC_DRV_hash ( uint32_t instance, ltc_drv_hash_algo algo, const uint8_t * input, uint32_t inputSize, const uint8_t * key, uint32_t keySize, uint8_t * output, uint32_t * outputSize )`

Perform the full keyed HASH in one function call.

Parameters

|            |                   |                                                           |
|------------|-------------------|-----------------------------------------------------------|
|            | <i>instance</i>   | LTC module instance number.                               |
|            | <i>algo</i>       | Block cipher algorithm to use for CMAC creation           |
|            | <i>input</i>      | Input data                                                |
|            | <i>inputSize</i>  | Size of input data in bytes                               |
|            | <i>key</i>        | Input key                                                 |
|            | <i>keySize</i>    | Size of input key in bytes                                |
| <i>out</i> | <i>output</i>     | Output hash data                                          |
| <i>out</i> | <i>outputSize</i> | Output param storing the size of the output hash in bytes |

Returns

Status of the one call hash operation.

## LTC HAL driver

### 41.2.7 LTC PKHA driver

#### 41.2.7.1 Overview

This section describes the programming interface of the LTC PKHA driver.

#### Data Structures

- struct [ltc\\_pkha\\_ecc\\_point](#)  
PKHA ECC point structure. *More...*

#### Functions

- [ltc\\_status\\_t LTC\\_DRV\\_PKHA\\_Clear\\_RegABNE](#) (uint32\_t instance, bool A, bool B, bool N, bool E)  
*Clears PKHA memory function.*
- [ltc\\_status\\_t LTC\\_DRV\\_PKHA\\_NormalToMontgomery](#) (uint32\_t instance, const uint8\_t \*N, uint16\_t sizeN, uint8\_t \*A, uint16\_t \*sizeA, uint8\_t \*B, uint16\_t \*sizeB, uint8\_t \*R2, uint16\_t \*sizeR2, [ltc\\_hal\\_pkha\\_timing\\_t](#) equalTime, [ltc\\_hal\\_pkha\\_f2m\\_t](#) arithType)  
*Converts from int to Montgomery format.*
- [ltc\\_status\\_t LTC\\_DRV\\_PKHA\\_MontgomeryToNormal](#) (uint32\_t instance, const uint8\_t \*N, uint16\_t sizeN, uint8\_t \*A, uint16\_t \*sizeA, uint8\_t \*B, uint16\_t \*sizeB, [ltc\\_hal\\_pkha\\_timing\\_t](#) equalTime, [ltc\\_hal\\_pkha\\_f2m\\_t](#) arithType)  
*Converts from Montgomery format to int.*
- [ltc\\_status\\_t LTC\\_DRV\\_PKHA\\_ModAdd](#) (uint32\_t instance, const uint8\_t \*A, uint16\_t sizeA, const uint8\_t \*B, uint16\_t sizeB, const uint8\_t \*N, uint16\_t sizeN, uint8\_t \*result, uint16\_t \*resultSize, [ltc\\_hal\\_pkha\\_f2m\\_t](#) arithType)  
*Performs modular addition -  $(A + B) \bmod N$ .*

## LTC HAL driver

### 41.2.7.3 Function Documentation

#### 41.2.7.3.1 `ltc_status_t LTC_DRV_PKHA_Clear_RegABNE ( uint32_t instance, bool A, bool B, bool N, bool E )`

This function clears the selected PKHA memory area.

Parameters

|                 |                                                                                     |
|-----------------|-------------------------------------------------------------------------------------|
| <i>instance</i> | LTC peripheral instance number                                                      |
| <i>A</i>        | Boolean value True (LTC_PKA shall be cleared) or false (LTC_PKA is left untouched). |
| <i>B</i>        | Boolean value True (LTC_PKB shall be cleared) or False (LTC_PKB is left untouched). |
| <i>N</i>        | Boolean value True (LTC_PKN shall be cleared) or False (LTC_PKN is left untouched). |
| <i>E</i>        | Boolean value True (LTC_PKE shall be cleared) or False (LTC_PKE is left untouched). |

Returns

Operation status.

**41.2.7.3.2** `ltc_status_t LTC_DRV_PKHA_NormalToMontgomery ( uint32_t instance, const uint8_t * N, uint16_t sizeN, uint8_t * A, uint16_t * sizeA, uint8_t * B, uint16_t * sizeB, uint8_t * R2, uint16_t * sizeR2, ltc_hal_pkha_timing_t equalTime, ltc_hal_pkha_f2m_t arithType )`

This function computes  $R2 \bmod N$  and optionally converts A or B into Montgomery format of A or B.

Parameters

|                |                 |                                                                                                                                   |
|----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------|
|                | <i>instance</i> | LTC peripheral instance number                                                                                                    |
|                | <i>N</i>        | modulus                                                                                                                           |
|                | <i>sizeN</i>    | size of N in bytes                                                                                                                |
| <i>in, out</i> | <i>The</i>      | first input in non-Montgomery format. Output Montgomery format of the first input.                                                |
| <i>in, out</i> | <i>sizeA</i>    | pointer to size variable. On input it holds size of input A in bytes. On output it holds size of Montgomery format of A in bytes. |
| <i>in, out</i> | <i>B</i>        | Second input in non-Montgomery format. Output Montgomery format of the second input.                                              |

## LTC HAL driver

|                |                  |                                                                                                                                   |
|----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <i>in, out</i> | <i>sizeB</i>     | pointer to size variable. On input it holds size of input B in bytes. On output it holds size of Montgomery format of B in bytes. |
| <i>out</i>     | <i>R2</i>        | Output Montgomery factor R2 mod N.                                                                                                |
| <i>out</i>     | <i>sizeR2</i>    | pointer to size variable. On output it holds size of Montgomery factor R2 mod N in bytes.                                         |
|                | <i>equalTime</i> | Run the function time equalized or no timing equalization.                                                                        |
|                | <i>arithType</i> | Type of arithmetic to perform (integer or F2m)                                                                                    |

Returns

Operation status.

**41.2.7.3.3** `ltc_status_t LTC_DRV_PKHA_MontgomeryToNormal ( uint32_t instance, const uint8_t * N, uint16_t sizeN, uint8_t * A, uint16_t * sizeA, uint8_t * B, uint16_t * sizeB, ltc_hal_pkha_timing_t equalTime, ltc_hal_pkha_f2m_t arithType )`

This function converts Montgomery format of A or B into int A or B.

Parameters

|                |                  |                                                                                                                                 |
|----------------|------------------|---------------------------------------------------------------------------------------------------------------------------------|
|                | <i>instance</i>  | LTC peripheral instance number                                                                                                  |
|                | <i>N</i>         | modulus.                                                                                                                        |
|                | <i>sizeN</i>     | size of N modulus in bytes.                                                                                                     |
| <i>in, out</i> | <i>A</i>         | Input first number in Montgomery format. Output is non-Montgomery format.                                                       |
| <i>in, out</i> | <i>sizeA</i>     | pointer to size variable. On input it holds size of the input A in bytes. On output it holds size of non-Montgomery A in bytes. |
| <i>in, out</i> | <i>B</i>         | Input first number in Montgomery format. Output is non-Montgomery format.                                                       |
| <i>in, out</i> | <i>sizeB</i>     | pointer to size variable. On input it holds size of the input B in bytes. On output it holds size of non-Montgomery B in bytes. |
|                | <i>equalTime</i> | Run the function time equalized or no timing equalization.                                                                      |
|                | <i>arithType</i> | Type of arithmetic to perform (integer or F2m)                                                                                  |

Returns

Operation status.

**41.2.7.3.4** `ltc_status_t LTC_DRV_PKHA_ModAdd ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * B, uint16_t sizeB, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize, ltc_hal_pkha_f2m_t arithType )`

This function performs modular addition of  $(A + B) \bmod N$ , with either integer or binary polynomial (F2m) inputs. In the F2m form, this function is equivalent to a bitwise XOR and it is functionally the same as subtraction.

Parameters

|     |                   |                                                                                              |
|-----|-------------------|----------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number                                                               |
|     | <i>A</i>          | first addend (integer or binary polynomial)                                                  |
|     | <i>sizeA</i>      | Size of A in bytes                                                                           |
|     | <i>B</i>          | second addend (integer or binary polynomial)                                                 |
|     | <i>sizeB</i>      | Size of B in bytes                                                                           |
|     | <i>N</i>          | modulus. For F2m operation this can be NULL, as N is ignored during F2m polynomial addition. |
|     | <i>sizeN</i>      | Size of N in bytes. This must be given for both integer and F2m polynomial additions.        |
| out | <i>result</i>     | Output array to store result of operation                                                    |
| out | <i>resultSize</i> | Output size of operation in bytes                                                            |
|     | <i>arithType</i>  | Type of arithmetic to perform (integer or F2m)                                               |

Returns

Operation status.

**41.2.7.3.5** `ltc_status_t LTC_DRV_PKHA_ModSub1 ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * B, uint16_t sizeB, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize )`

This function performs modular subtraction of  $(A - B) \bmod N$  with integer inputs.

## LTC HAL driver

### Parameters

|     |                   |                                              |
|-----|-------------------|----------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number               |
|     | <i>A</i>          | first addend (integer or binary polynomial)  |
|     | <i>sizeA</i>      | Size of A in bytes                           |
|     | <i>B</i>          | second addend (integer or binary polynomial) |
|     | <i>sizeB</i>      | Size of B in bytes                           |
|     | <i>N</i>          | modulus                                      |
|     | <i>sizeN</i>      | Size of N in bytes                           |
| out | <i>result</i>     | Output array to store result of operation    |
| out | <i>resultSize</i> | Output size of operation in bytes            |

### Returns

Operation status.

**41.2.7.3.6** `ltc_status_t LTC_DRV_PKHA_ModSub2 ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * B, uint16_t sizeB, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize )`

This function performs modular subtraction of  $(B - A) \bmod N$ , with integer inputs.

### Parameters

|     |                 |                                              |
|-----|-----------------|----------------------------------------------|
|     | <i>instance</i> | LTC peripheral instance number               |
|     | <i>A</i>        | first addend (integer or binary polynomial)  |
|     | <i>sizeA</i>    | Size of A in bytes                           |
|     | <i>B</i>        | second addend (integer or binary polynomial) |
|     | <i>sizeB</i>    | Size of B in bytes                           |
|     | <i>N</i>        | modulus                                      |
|     | <i>sizeN</i>    | Size of N in bytes                           |
| out | <i>result</i>   | Output array to store result of operation    |

|     |                   |                                   |
|-----|-------------------|-----------------------------------|
| out | <i>resultSize</i> | Output size of operation in bytes |
|-----|-------------------|-----------------------------------|

Returns

Operation status.

**41.2.7.3.7** `ltc_status_t LTC_DRV_PKHA_ModMul ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * B, uint16_t sizeB, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize, ltc_hal_pkha_f2m_t arithType, ltc_hal_pkha_montgomery_form_t montIn, ltc_hal_pkha_montgomery_form_t montOut, ltc_hal_pkha_timing_t equalTime )`

This function performs modular multiplication with either integer or binary polynomial (F2m) inputs. It can optionally specify whether inputs and/or outputs will be in Montgomery form or not.

Parameters

|     |                   |                                                                                                                     |
|-----|-------------------|---------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number                                                                                      |
|     | <i>A</i>          | first addend (integer or binary polynomial)                                                                         |
|     | <i>sizeA</i>      | Size of A in bytes                                                                                                  |
|     | <i>B</i>          | second addend (integer or binary polynomial)                                                                        |
|     | <i>sizeB</i>      | Size of B in bytes                                                                                                  |
|     | <i>N</i>          | modulus.                                                                                                            |
|     | <i>sizeN</i>      | Size of N in bytes                                                                                                  |
| out | <i>result</i>     | Output array to store result of operation                                                                           |
| out | <i>resultSize</i> | Output size of operation in bytes                                                                                   |
|     | <i>arithType</i>  | Type of arithmetic to perform (integer or F2m)                                                                      |
|     | <i>montIn</i>     | Format of inputs                                                                                                    |
|     | <i>montOut</i>    | Format of output                                                                                                    |
|     | <i>equalTime</i>  | Run the function time equalized or no timing equalization. This argument is ignored for F2m modular multiplication. |

## LTC HAL driver

Returns

Operation status.

**41.2.7.3.8** `ltc_status_t LTC_DRV_PKHA_ModExp ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * N, uint16_t sizeN, const uint8_t * E, uint16_t sizeE, uint8_t * result, uint16_t * resultSize, ltc_hal_pkha_f2m_t arithType, ltc_hal_pkha_montgomery_form_t montIn, ltc_hal_pkha_timing_t equalTime )`

This function performs modular exponentiation with either integer or binary polynomial (F2m) inputs.

Parameters

|     |                   |                                                            |
|-----|-------------------|------------------------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number                             |
|     | <i>A</i>          | first addend (integer or binary polynomial)                |
|     | <i>sizeA</i>      | Size of A in bytes                                         |
|     | <i>N</i>          | modulus                                                    |
|     | <i>sizeN</i>      | Size of N in bytes                                         |
|     | <i>E</i>          | exponent                                                   |
|     | <i>sizeE</i>      | Size of E in bytes                                         |
| out | <i>result</i>     | Output array to store result of operation                  |
| out | <i>resultSize</i> | Output size of operation in bytes                          |
|     | <i>montIn</i>     | Format of A input (normal or Montgomery)                   |
|     | <i>arithType</i>  | Type of arithmetic to perform (integer or F2m)             |
|     | <i>equalTime</i>  | Run the function time equalized or no timing equalization. |

Returns

Operation status.

**41.2.7.3.9** `ltc_status_t LTC_DRV_PKHA_ModRed ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize, ltc_hal_pkha_f2m_t arithType )`

This function performs modular reduction with either integer or binary polynomial (F2m) inputs.

Parameters

|     |                   |                                                |
|-----|-------------------|------------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number                 |
|     | <i>A</i>          | first addend (integer or binary polynomial)    |
|     | <i>sizeA</i>      | Size of A in bytes                             |
|     | <i>N</i>          | modulus                                        |
|     | <i>sizeN</i>      | Size of N in bytes                             |
| out | <i>result</i>     | Output array to store result of operation      |
| out | <i>resultSize</i> | Output size of operation in bytes              |
|     | <i>arithType</i>  | Type of arithmetic to perform (integer or F2m) |

Returns

Operation status.

**41.2.7.3.10** `ltc_status_t LTC_DRV_PKHA_ModInv ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize, ltc_hal_pkha_f2m_t arithType )`

This function performs modular inversion with either integer or binary polynomial (F2m) inputs.

Parameters

|     |                   |                                                |
|-----|-------------------|------------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number                 |
|     | <i>A</i>          | first addend (integer or binary polynomial)    |
|     | <i>sizeA</i>      | Size of A in bytes                             |
|     | <i>N</i>          | modulus                                        |
|     | <i>sizeN</i>      | Size of N in bytes                             |
| out | <i>result</i>     | Output array to store result of operation      |
| out | <i>resultSize</i> | Output size of operation in bytes              |
|     | <i>arithType</i>  | Type of arithmetic to perform (integer or F2m) |

Returns

Operation status.

## LTC HAL driver

**41.2.7.3.11** `ltc_status_t LTC_DRV_PKHA_ModR2 ( uint32_t instance, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize, ltc_hal_pkha_f2m_t arithType )`

This function computes a constant to assist in converting operands into the Montgomery residue system representation.

**Parameters**

|     |                   |                                                |
|-----|-------------------|------------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number                 |
|     | <i>N</i>          | modulus                                        |
|     | <i>sizeN</i>      | Size of N in bytes                             |
| out | <i>result</i>     | Output array to store result of operation      |
| out | <i>resultSize</i> | Output size of operation in bytes              |
|     | <i>arithType</i>  | Type of arithmetic to perform (integer or F2m) |

**Returns**

Operation status.

**41.2.7.3.12** `ltc_status_t LTC_DRV_PKHA_GCD ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * N, uint16_t sizeN, uint8_t * result, uint16_t * resultSize, ltc_hal_pkha_f2m_t arithType )`

This function calculates the greatest common divisor of two inputs with either integer or binary polynomial (F2m) inputs.

**Parameters**

|     |                   |                                                  |
|-----|-------------------|--------------------------------------------------|
|     | <i>instance</i>   | LTC peripheral instance number                   |
|     | <i>A</i>          | first value (must be smaller than or equal to N) |
|     | <i>sizeA</i>      | Size of A in bytes                               |
|     | <i>N</i>          | second value (must be non-zero)                  |
|     | <i>sizeN</i>      | Size of N in bytes                               |
| out | <i>result</i>     | Output array to store result of operation        |
| out | <i>resultSize</i> | Output size of operation in bytes                |
|     | <i>arithType</i>  | Type of arithmetic to perform (integer or F2m)   |

**Returns**

Operation status.

**41.2.7.3.13** `ltc_status_t LTC_DRV_PKHA_PrimalityTest ( uint32_t instance, const uint8_t * A, uint16_t sizeA, const uint8_t * B, uint16_t sizeB, const uint8_t * N, uint16_t sizeN, bool * res )`

This function calculates whether or not a candidate prime number is likely to be a prime.

## LTC HAL driver

### Parameters

|     |                 |                                                      |
|-----|-----------------|------------------------------------------------------|
|     | <i>instance</i> | LTC peripheral instance number                       |
|     | <i>A</i>        | initial random seed                                  |
|     | <i>sizeA</i>    | Size of A in bytes                                   |
|     | <i>B</i>        | number of trial runs                                 |
|     | <i>sizeB</i>    | Size of B in bytes                                   |
|     | <i>N</i>        | candidate prime integer                              |
|     | <i>sizeN</i>    | Size of N in bytes                                   |
| out | <i>res</i>      | True if the value is likely prime or false otherwise |

### Returns

Operation status.

**41.2.7.3.14** `ltc_status_t LTC_DRV_PKHA_ECC_PointAdd ( uint32_t instance, const ltc_pkha_ecc_point * A, const ltc_pkha_ecc_point * B, const uint8_t * N, const uint8_t * R2modN, const uint8_t * aCurveParam, const uint8_t * bCurveParam, uint8_t size, ltc_hal_pkha_f2m_t arithType, ltc_pkha_ecc_point * result )`

This function performs ECC point addition over a prime field (Fp) or binary field (F2m) using affine coordinates.

### Parameters

|  |                 |                                                                                                                                                 |
|--|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <i>instance</i> | LTC peripheral instance number                                                                                                                  |
|  | <i>A</i>        | Left-hand point                                                                                                                                 |
|  | <i>B</i>        | Right-hand point                                                                                                                                |
|  | <i>N</i>        | Prime modulus of the field                                                                                                                      |
|  | <i>R2modN</i>   | NULL (the function computes R2modN internally) or pointer to pre-computed R2modN (obtained from <a href="#">LTC_DRV_PKHA_ModR2()</a> function). |

|     |                    |                                                |
|-----|--------------------|------------------------------------------------|
|     | <i>aCurveParam</i> | A parameter from curve equation                |
|     | <i>aCurveParam</i> | B parameter from curve equation (constant)     |
|     | <i>size</i>        | Size in bytes of curve points and parameters   |
|     | <i>arithType</i>   | Type of arithmetic to perform (integer or F2m) |
| out | <i>result</i>      | Result point                                   |

Returns

Operation status.

**41.2.7.3.15** `ltc_status_t LTC_DRV_PKHA_ECC_PointDouble ( uint32_t instance, const ltc_pkha_ecc_point * B, const uint8_t * N, const uint8_t * aCurveParam, const uint8_t * bCurveParam, uint8_t size, ltc_hal_pkha_f2m_t arithType, ltc_pkha_ecc_point * result )`

This function performs ECC point doubling over a prime field (Fp) or binary field (F2m) using affine coordinates.

Parameters

|     |                    |                                                |
|-----|--------------------|------------------------------------------------|
|     | <i>instance</i>    | LTC peripheral instance number                 |
|     | <i>B</i>           | Point to double                                |
|     | <i>N</i>           | Prime modulus of the field                     |
|     | <i>aCurveParam</i> | A parameter from curve equation                |
|     | <i>aCurveParam</i> | B parameter from curve equation (constant)     |
|     | <i>size</i>        | Size in bytes of curve points and parameters   |
|     | <i>arithType</i>   | Type of arithmetic to perform (integer or F2m) |
| out | <i>result</i>      | Result point                                   |

Returns

Operation status.

**41.2.7.3.16** `ltc_status_t LTC_DRV_PKHA_ECC_PointMul ( uint32_t instance, const ltc_pkha_ecc_point * A, const uint8_t * E, uint8_t sizeE, const uint8_t * N, const uint8_t * R2modN, const uint8_t * aCurveParam, const uint8_t * bCurveParam, uint8_t size, ltc_hal_pkha_timing_t equalTime, ltc_hal_pkha_f2m_t arithType, ltc_pkha_ecc_point * result, bool * infinity )`

This function performs ECC point multiplication to multiply an ECC point by a scalar integer multiplier over a prime field (Fp) or a binary field (F2m).

## LTC HAL driver

### Parameters

|     |                    |                                                                                                                                            |
|-----|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
|     | <i>instance</i>    | LTC peripheral instance number                                                                                                             |
|     | <i>A</i>           | Point as multiplicand                                                                                                                      |
|     | <i>E</i>           | Scalar multiple                                                                                                                            |
|     | <i>sizeE</i>       | The size of E, in bytes                                                                                                                    |
|     | <i>N</i>           | Modulus, a prime number for the Fp field or Irreducible polynomial for F2m field.                                                          |
|     | <i>NULL</i>        | (the function computes R2modN internally) or pointer to pre-computed R2modN (obtained from <a href="#">LTC_DRV_PKHA_ModR2()</a> function). |
|     | <i>aCurveParam</i> | A parameter from curve equation                                                                                                            |
|     | <i>bCurveParam</i> | B parameter from curve equation (C parameter for operation over F2m).                                                                      |
|     | <i>size</i>        | Size in bytes of curve points and parameters                                                                                               |
|     | <i>equalTime</i>   | Run the function time equalized or no timing equalization.                                                                                 |
|     | <i>arithType</i>   | Type of arithmetic to perform (integer or F2m)                                                                                             |
| out | <i>result</i>      | Result point                                                                                                                               |
| out | <i>infinity</i>    | Output true if the result is point of infinity, and false otherwise. Writing of this output will be ignored if the argument is NULL.       |

### Returns

Operation status.

## 41.3 LTC driver

### 41.3.1 Overview

This chapter describes the programming interface of the LTC driver.

All driver functions documented in this module are synchronous - that is, all operations are complete and results is available for further usage when a function returns. When called, driver functions don't return until complete. The driver functions are not re-entrant.

Driver functions implement optional protection by a mutex for multithreading. The feature can be enabled by the `LTC_DRV_RTOS_MULTI_THREAD` compile time macro. The option is recommended for enabling in RTOS environment to protect LTC module against concurrent accesses from different tasks. If you compile LTC driver with `LTC_DRV_RTOS_MULTI_THREAD` disabled, you still should implement custom way of protection against concurrent calls to LTC driver API from different tasks or from interrupts.

Driver functions implement optional sleep in RTOS feature (calling task is blocked while waiting for an operation to complete). The feature can be enabled by the `LTC_DRV_RTOS_SLEEP` compile time macro. The option is recommended for enabling in RTOS environment to allow other tasks execute. If enabled, the driver enables LTC interrupt and from it's interrupt service routine, `LTC_DRV_IRQHandler()` shall be called. If the `LTC_DRV_RTOS_SLEEP` option is disabled, the driver disables LTC interrupt.

All possible combinations of the two settings is supported. The driver functions cannot be called inside an interrupt service routine, unless both settings `LTC_DRV_RTOS_MULTI_THREAD` and `LTC_DRV_RTOS_SLEEP` are disabled. Only in this configuration the driver executes simple polling loops, they can be called inside an interrupt service routine, although execution time shall be considered.

### 41.3.2 LTC Driver Initialization

LTC Driver is initialized by calling the `LTC_DRV_Init()` function. If AES engine is used and the LTC module implementation features LTC DPA Mask Seed register, seed the DPA mask generator, by using the seed from a random number generator. The `LTC_DRV_SetDPAMaskSeed()` function is provided to set the DPA mask seed.

#### Modules

- [LTC AES driver](#)
- [LTC DES driver](#)
- [LTC HASH driver](#)
- [LTC PKHA driver](#)

#### Macros

- #define `LTC_DRV_RTOS_MULTI_THREAD` (USE\_RTOS)  
*Enables/disables multithread support in the LTC driver.*

## LTC driver

- #define `LTC_DRV_RTOS_SLEEP` (USE\_RTOS)  
*Enables/disables putting the calling task to "sleep" during the LTC blocking operation.*

## Functions

- `ltc_status_t LTC_DRV_Init` (uint32\_t instance)  
*Initializes the LTC driver.*
- void `LTC_DRV_Deinit` (uint32\_t instance)  
*Deinitializes the LTC driver.*
- void `LTC_DRV_IRQHandler` (uint32\_t instance)  
*LTC interrupt handler.*

## Variables

- LTC\_Type \*const `g_ltcBase` []  
*Table of base addresses for LTC instances.*
- const IRQn\_Type `g_ltcIrqId` []  
*Table to save LTC IRQ enumeration numbers defined in the CMSIS header file.*

### 41.3.3 Macro Definition Documentation

#### 41.3.3.1 #define LTC\_DRV\_RTOS\_MULTI\_THREAD (USE\_RTOS)

Enables/disables multithread support in the LTC driver, which is achieved by locking critical sections with a mutex and enabled by default for RTOS.

#### 41.3.3.2 #define LTC\_DRV\_RTOS\_SLEEP (USE\_RTOS)

Enables/disables putting the calling task to "sleep" during the LTC blocking operation. If enabled, it requires using of LTC IRQ handler. It is enabled by default for RTOS.

### 41.3.4 Function Documentation

#### 41.3.4.1 ltc\_status\_t LTC\_DRV\_Init ( uint32\_t instance )

This function initializes the LTC driver.

Parameters

|                 |                  |
|-----------------|------------------|
| <i>instance</i> | LTC instance ID. |
|-----------------|------------------|

#### 41.3.4.2 void LTC\_DRV\_Deinit ( uint32\_t *instance* )

This function deinitializes the LTC driver.

Parameters

|                 |                  |
|-----------------|------------------|
| <i>instance</i> | LTC instance ID. |
|-----------------|------------------|

#### 41.3.4.3 void LTC\_DRV\_IRQHandler ( uint32\_t *instance* )

This function handles the LTC interrupt.

Parameters

|                 |                  |
|-----------------|------------------|
| <i>instance</i> | LTC instance ID. |
|-----------------|------------------|

### 41.3.5 Variable Documentation

41.3.5.1 LTC\_Type\* const g\_ltcBase[]

41.3.5.2 const IRQn\_Type g\_ltcIrqId[]

## Chapter 42

# Multipurpose Clock Generator (MCG)

### 42.1 Overview

The Kinetis SDK provides a HAL driver for the Multipurpose Clock Generator (MCG) block of Kinetis devices.

### Modules

- [MCG HAL driver](#)

## MCG HAL driver

### 42.2 MCG HAL driver

#### 42.2.1 Overview

The chapter describes the programming interface of the MCG HAL driver. The multipurpose clock generator module provides several clock source choices for the MCU. The MCG HAL provides a set of APIs to access these registers, including these services:

- OSC related APIs;
- FLL reference clock source, divider and output frequency;
- PLL reference clock source, divider and output frequency;
- MCG mode related APIs;
- MCG auto trim machine function;

#### 42.2.2 OSC-related APIs

MCG uses the OSC as an external reference clock source. To use OSC, set RANGE, HGO, and EREFS correctly according to the board configuration. The functions [CLOCK\\_HAL\\_SetOsc0Mode\(\)](#)/[CLOCK\\_HAL\\_SetOsc1Mode\(\)](#) are used for this purpose.

The OSC frequency is saved in global variables `g_xtal0ClkFreq`, `g_xtal1ClkFreq` and `g_xtal-RtcClkFreq`, which are used to calculate the MCG output frequency. Set these variables according to the board settings.

MCG provides monitor for each OSC. When the OSC clock is lost, the monitor triggers an interrupt or a system reset. To enable the OSC monitor, use functions [CLOCK\\_HAL\\_EnableXXXMonitor\(\)](#), where XXX is the OSC name, such as `Osc0`, `Osc1`, `RtcOsc`.

For multiple OSC instances, use the [CLOCK\\_HAL\\_SetOscselMode\(\)](#) function to choose which OSC to use. The [CLOCK\\_HAL\\_TestOscFreq\(\)](#) function tests different OSCs frequencies according to parameters.

#### 42.2.3 FLL reference clock source, divider, and output frequency.

To use MCG FLL, ensure that the FLL reference clock, reference clock divider, and FLL DCO are configured correctly. The FLL reference clock divider FRDIV should configure the output reference clock in the range of 31.25 kHz to 39.0625 kHz. See the reference manual for more details. For ease-of-use, the function [CLOCK\\_HAL\\_GetAvailableFrdiv\(\)](#) is used to get the proper FRDIV value.

MCG FLL uses either the internal clock or the external clock as a reference clock. When selecting the external clock, the [CLOCK\\_HAL\\_TestFllExternalRefFreq\(\)](#) function calculates the PLL external reference clock frequency according to parameters. It is useful to validate the parameters before setting them to registers.

The [CLOCK\\_HAL\\_GetFllRefClk\(\)](#) function returns the current FLL reference clock frequency. The function [CLOCK\\_HAL\\_TestFllFreq\(\)](#) calculates the FLL output frequency based on the input reference clock frequency and the DCO settings. It can be used to validate the setting values before setting them to registers. The [CLOCK\\_HAL\\_GetFllClk\(\)](#) function returns the current FLL frequency.

#### 42.2.4 PLL reference clock source, divider and output frequency

The PLL uses OSC as an external reference clock. To use MCG PLL, ensure that the reference clock, PRDIV, and VDIV are set correctly.

The register bit fields PRDIV and VDIV can be configured to generate the desired output frequency. See the appropriate reference manual for more information about setting values. For ease-of-use, the MCG HAL driver provides a function `CLOCK_HAL_CalculatePllDiv()`. Based on the reference clock frequency and the desired output frequency, this function calculates the available PRDIV and VDIV value to ensure that the output frequency is as aligned as possible to the desired frequency.

The PLL can be enabled when the MCG is in FLL mode. Use the functions `CLOCK_HAL_EnablePll0InFllMode()` and `CLOCK_HAL_EnablePll1InFllMode()` to enable the PLL in FLL mode.

For some platforms, the PLL loss of lock can trigger system reset. Use the function `CLOCK_HAL_SetPllLostLockResetCmd()` to configure this feature.

#### 42.2.5 MCG mode related APIs

MCG HAL driver provides functions for mode check and mode transition.

The `CLOCK_HAL_GetMcgMode()` function gets the current MCG mode according to the MCG internal register.

Mode transition functions are defined as `CLOCK_HAL_SetXXXMode`, where XXX is the target mode name. The key register bit fields such as PRDIV, VDIV, FRDIV, and DMX32 should be passed as parameters to set the MCG to a specific state. If these parameters are invalid or can't reach the target mode directly, an error is returned.

If the FLL is the target mode, applications should pass a delay function, which ensures that the FLL is stable after changing the reference clock, FRDIV, DMX32, and DRS. Check the appropriate datasheet for more information about delay times.

#### 42.2.6 MCG auto trim machine(ATM) function

The auto trim machine automatically trims the MCG internal reference clock using an external reference clock. See the appropriate reference manual for more details.

The function `CLOCK_HAL_TrimInternalRefClk()` function trims the IRC clock to a desired frequency. The bus clock, in the range of 8-16 MHz, should be the only reference clock and the IRC should not be the MCGOUTCLK source. Otherwise, the ATM does not work and the function returns an error.

The MCG ATM has a flag, which indicates whether the trim fails or not. Use the functions `CLOCK_HAL_IsAutoTrimMachineFailed()` and `CLOCK_HAL_ClearAutoTrimMachineFailed()` to check and clear the flag.

## MCG HAL driver

- Sets the Low Power Select.*

## MCG HAL driver

- void `CLOCK_HAL_PrepareOsc` (MCG\_Type \*base, `mcg_oscselect_t` setting)  
*Prepare the OSC external clock.*

## MCG FLL API

- static `mcg_fll_src_t` `CLOCK_HAL_GetFllSrc` (MCG\_Type \*base)  
*Gets the FLL source status.*
- static void `CLOCK_HAL_SetFllFilterPreserveCmd` (MCG\_Type \*base, bool enable)  
*Sets the FLL Filter Preserve Enable Setting.*
- `mcg_status_t` `CLOCK_HAL_GetAvailableFrdiv` (`osc_range_t` range0, `mcg_oscselect_t` oscsel, `uint32_t` inputFreq, `uint8_t` \*frdiv)  
*Calculates the proper FRDIV setting.*

## MCG internal reference clock APIs

- static void `CLOCK_HAL_SetInternalRefClkEnableCmd` (MCG\_Type \*base, bool enable)  
*Sets the internal reference clock enable or not.*
- static void `CLOCK_HAL_SetInternalRefClkEnableInStopCmd` (MCG\_Type \*base, bool enable)  
*Sets the internal reference clock enable or not in stop mode.*
- static void `CLOCK_HAL_SetInternalRefClkMode` (MCG\_Type \*base, `mcg_irc_mode_t` mode)  
*Sets the Internal Reference Clock Select.*
- static `mcg_irc_mode_t` `CLOCK_HAL_GetInternalRefClkMode` (MCG\_Type \*base)  
*Gets the Internal Reference Clock Status.*
- void `CLOCK_HAL_UpdateFastClkInternalRefDiv` (MCG\_Type \*base, `uint8_t` fcrdiv)  
*Updates the Fast Clock Internal Reference Divider Setting.*
- void `CLOCK_HAL_UpdateInternalRefClk` (MCG\_Type \*base, `mcg_irc_mode_t` ircs, `uint8_t` fcrdiv, bool enableInStop)  
*Updates the Internal Reference clock (MCGIRCLK)*

## MCG OSC APIs

- void `CLOCK_HAL_SetOsc0Mode` (MCG\_Type \*base, `osc_range_t` range, `osc_gain_t` hgo, `osc_src_t` erefs)  
*Sets the OSC0 work mode.*
- static bool `CLOCK_HAL_IsOsc0Stable` (MCG\_Type \*base)  
*Gets the OSC initialization status.*
- void `CLOCK_HAL_EnableOsc0Monitor` (MCG\_Type \*base, `mcg_osc_monitor_mode_t` mode)  
*Enables the OSC0 external clock monitor.*
- static void `CLOCK_HAL_DisableOsc0Monitor` (MCG\_Type \*base)  
*Disables the OSC0 external clock monitor.*
- static bool `CLOCK_HAL_IsOsc0MonitorEnabled` (MCG\_Type \*base)  
*Checks the OSC0 external clock monitor is enabled or not.*
- static bool `CLOCK_HAL_IsOsc0LostLock` (MCG\_Type \*base)  
*Gets the OSC0 Loss of Clock Status.*
- static void `CLOCK_HAL_ClearOsc0LostLock` (MCG\_Type \*base)  
*Clears the OSC0 Loss of Clock Status.*

## MCG Auto Trim Machine (ATM)

- `mcg_atm_error_t CLOCK_HAL_TrimInternalRefClk` (MCG\_Type \*base, uint32\_t extFreq, uint32\_t desireFreq, uint32\_t \*actualFreq, `mcg_atm_select_t` atms)  
*Auto trims the internal reference clock.*
- static bool `CLOCK_HAL_IsAutoTrimMachineFailed` (MCG\_Type \*base)  
*Gets the Automatic Trim machine Fail Flag.*
- static void `CLOCK_HAL_ClearAutoTrimMachineFailed` (MCG\_Type \*base)  
*Clears the Automatic Trim machine Fail Flag.*

## 42.2.7 Macro Definition Documentation

### 42.2.7.1 #define MCG\_MODE\_CHECK\_PARAM 0

It is recommend to enable this macro when debug. After debug, disable this macro for code size optimization.

## 42.2.8 Enumeration Type Documentation

### 42.2.8.1 enum mcg\_fll\_src\_t

Enumerator

- kMcgFllSrcExternal*** External reference clock is selected.
- kMcgFllSrcInternal*** The slow internal reference clock is selected.

### 42.2.8.2 enum osc\_range\_t

Enumerator

- kOscRangeLow*** Low frequency range selected for the crystal OSC.
- kOscRangeHigh*** High frequency range selected for the crystal OSC.
- kOscRangeVeryHigh*** Very High frequency range selected for the crystal OSC.
- kOscRangeVeryHigh1*** Very High frequency range selected for the crystal OSC.
- kOscRangeLow*** Low frequency range selected for the crystal OSC.
- kOscRangeHigh*** High frequency range selected for the crystal OSC.
- kOscRangeVeryHigh*** Very High frequency range selected for the crystal OSC.
- kOscRangeVeryHigh1*** Very High frequency range selected for the crystal OSC.

### 42.2.8.3 enum osc\_gain\_t

Enumerator

- kOscGainLow*** Configure crystal oscillator for low-power operation.

## MCG HAL driver

- kOscGainHigh* Configure crystal oscillator for high-gain operation.
- kOscGainLow* Configure crystal oscillator for low-power operation.
- kOscGainHigh* Configure crystal oscillator for high-gain operation.

### 42.2.8.4 enum osc\_src\_t

Enumerator

- kOscSrcExt* External reference clock requested.
- kOscSrcOsc* Oscillator requested.
- kOscSrcExt* Selects external input clock.
- kOscSrcOsc* Selects Oscillator.

### 42.2.8.5 enum mcg\_irc\_mode\_t

Enumerator

- kMcgIrcSlow* Slow internal reference clock selected.
- kMcgIrcFast* Fast internal reference clock selected.

### 42.2.8.6 enum mcg\_dmx32\_select\_t

Enumerator

- kMcgDmx32Default* DCO has a default range of 25%.
- kMcgDmx32Fine* DCO is fine-tuned for maximum frequency with 32.768 kHz reference.

### 42.2.8.7 enum mcg\_dco\_range\_select\_t

Enumerator

- kMcgDcoRangeSelLow* Low frequency range.
- kMcgDcoRangeSelMid* Mid frequency range.
- kMcgDcoRangeSelMidHigh* Mid-High frequency range.
- kMcgDcoRangeSelHigh* High frequency range.

### 42.2.8.8 enum mcg\_pll\_ref\_mode\_t

Enumerator

- kMcgPllRefOsc0* Selects OSC0 clock source as its external reference clock.
- kMcgPllRefOsc1* Selects OSC1 clock source as its external reference clock.

#### 42.2.8.9 enum mcg\_clkout\_src\_t

Enumerator

- kMcgClkOutSrcOut* Output of the FLL is selected (reset default)
- kMcgClkOutSrcInternal* Internal reference clock is selected.
- kMcgClkOutSrcExternal* External reference clock is selected.

#### 42.2.8.10 enum mcg\_clkout\_stat\_t

Enumerator

- kMcgClkOutStatFll* Output of the FLL is selected (reset default)
- kMcgClkOutStatInternal* Internal reference clock is selected.
- kMcgClkOutStatExternal* External reference clock is selected.
- kMcgClkOutStatPll* Output of the PLL is selected.

#### 42.2.8.11 enum mcg\_atm\_select\_t

Enumerator

- kMcgAtmSel32k* 32 kHz Internal Reference Clock selected
- kMcgAtmSel4m* 4 MHz Internal Reference Clock selected

#### 42.2.8.12 enum mcg\_oscsel\_select\_t

Enumerator

- kMcgOscselOsc* Selects System Oscillator (OSCCLK)
- kMcgOscselRtc* Selects 32 kHz RTC Oscillator.

#### 42.2.8.13 enum mcg\_osc\_monitor\_mode\_t

Enumerator

- kMcgOscMonitorInt* Generate interrupt when clock lost.
- kMcgOscMonitorReset* Generate reset when clock lost.

#### 42.2.8.14 enum mcg\_pll\_clk\_select\_t

Enumerator

- kMcgPllClkSelPll0* PLL0 output clock is selected.

## MCG HAL driver

### 42.2.8.15 enum mcg\_atm\_error\_t

Enumerator

- kMcgAtmErrorNone* No error.
- kMcgAtmErrorBusClockRange* Bus clock frequency is not in 8MHz to 16 MHz.
- kMcgAtmErrorDesireFreqRange* Desired frequency is out of range.
- kMcgAtmErrorIrcUsed* IRC clock is used to generate system clock.
- kMcgAtmErrorTrimValueInvalid* The auto trim compare value ACT is invalid.
- kMcgAtmErrorHardwareFail* ATC[ATMF] fail flag asserts.

### 42.2.8.16 enum mcg\_status\_t

Enumerator

- kStatus\_MCG\_Success* Success.
- kStatus\_MCG\_Fail* Execution failed.

### 42.2.8.17 enum mcg\_modes\_t

Enumerator

- kMcgModeFEI* FEI - FLL Engaged Internal.
- kMcgModeFBI* FBI - FLL Bypassed Internal.
- kMcgModeBLPI* BLPI - Bypassed Low Power Internal.
- kMcgModeFEE* FEE - FLL Engaged External.
- kMcgModeFBE* FBE - FLL Bypassed External.
- kMcgModeBLPE* BLPE - Bypassed Low Power External.
- kMcgModePBE* PBE - PLL Bypassed External.
- kMcgModePEE* PEE - PLL Engaged External.
- kMcgModeSTOP* STOP - Stop.
- kMcgModeError* Unknown mode.

### 42.2.8.18 enum mcg\_mode\_error\_t

Enumerator

- kMcgModeErrNone* No error.
- kMcgModeErrModeUnreachable* Target mode is unreachable.
- kMcgModeErrOscFreqRange* OSC frequency is invalid.
- kMcgModeErrIrcSlowRange* Slow IRC is outside the allowed range.
- kMcgModeErrIrcFastRange* Fast IRC is outside the allowed range.
- kMcgModeErrFllRefRange* FLL reference frequency is outside the allowed range.

- kMcgModeErrFlFrdivRange* FRDIV outside allowed range.
- kMcgModeErrFlDrsRange* DRS is out of range.
- kMcgModeErrFlDmx32Range* DMX32 setting not allowed.
- kMcgModeErrPlPrdivRange* PRDIV outside allowed range.
- kMcgModeErrPlVdivRange* VDIV outside allowed range.
- kMcgModeErrPlRefClkRange* PLL reference clock frequency, out of range.
- kMcgModeErrPlLockBit* LOCK or LOCK2 bit did not set.
- kMcgModeErrPlOutClkRange* PLL output frequency is outside allowed range.

## 42.2.9 Function Documentation

### 42.2.9.1 `uint32_t CLOCK_HAL_TestOscFreq ( MCG_Type * base, mcg_oscsel_select_t oscselVal )`

This function tests the external clock frequency, including OSC, RTC and IRC48M. If the OSC is not initialized, this function returns 0.

Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <i>base</i>      | Base address for current MCG instance. |
| <i>oscselVal</i> | External OSC selection.                |

Returns

MCG external reference clock frequency.

### 42.2.9.2 `uint32_t CLOCK_HAL_TestFlExternalRefFreq ( MCG_Type * base, uint32_t extFreq, uint8_t frdivVal, osc_range_t range0, mcg_oscsel_select_t oscsel )`

This function calculates the MCG FLL external reference clock value in frequency(Hertz) based on the input parameters.

Parameters

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>base</i>     | Base address for current MCG instance.        |
| <i>extFreq</i>  | External OSC frequency.                       |
| <i>frdivVal</i> | FLL external reference divider value (FRDIV). |

## MCG HAL driver

|               |                                 |
|---------------|---------------------------------|
| <i>range0</i> | OSC0 frequency range selection. |
| <i>oscsel</i> | External OSC selection.         |

Returns

MCG FLL external reference clock frequency.

### 42.2.9.3 uint32\_t CLOCK\_HAL\_GetFllRefClk ( MCG\_Type \* *base* )

This function returns the FLL reference clock frequency based on the current MCG configurations and settings. FLL should be properly configured in order to get the valid value.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

Frequency value in Hertz of FLL reference clock.

### 42.2.9.4 uint32\_t CLOCK\_HAL\_TestFllFreq ( MCG\_Type \* *base*, uint32\_t *fllRef*, mcg\_dm32\_select\_t *dmx32*, mcg\_dco\_range\_select\_t *drs* )

This function calculates the FLL frequency based on input parameters.

Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current MCG instance. |
| <i>fllRef</i> | FLL reference clock frequency.         |
| <i>dmx32</i>  | DCO max 32K setting.                   |
| <i>drs</i>    | DCO range selection.                   |

Returns

Frequency value in Hertz of the mcgflclk.

### 42.2.9.5 uint32\_t CLOCK\_HAL\_GetFllClk ( MCG\_Type \* *base* )

This function returns the mcgflclk value in frequency(Hertz) based on the current MCG configurations and settings. FLL should be properly configured get the valid value.

## Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

## Returns

Frequency value in Hertz of the mcgpllclk.

**42.2.9.6 uint32\_t CLOCK\_HAL\_GetInternalRefClk ( MCG\_Type \* *base* )**

This function returns the MCGIRCLK value in frequency (Hertz) based on the current MCG configurations and settings. It does not check if the MCGIRCLK is enabled or not, just calculate and return the value.

## Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

## Returns

Frequency value in Hertz of the MCGIRCLK.

**42.2.9.7 uint32\_t CLOCK\_HAL\_GetFixedFreqClk ( MCG\_Type \* *base* )**

This function get the MCGFFCLK, it is only valid when its frequency is not more than MCGOUTCLK/8. If MCGFFCLK is invalid, this function returns 0.

## Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

## Returns

Frequency value in Hertz of MCGFFCLK.

**42.2.9.8 uint32\_t CLOCK\_HAL\_GetOutClk ( MCG\_Type \* *base* )**

This function returns the mcgoutclk value in frequency (Hertz) based on the current MCG configurations and settings. The configuration should be properly done in order to get the valid value.

## MCG HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

### Returns

Frequency value in Hertz of mcgoutclk.

#### 42.2.9.9 static void CLOCK\_HAL\_SetClkOutSrc ( MCG\_Type \* *base*, mcg\_clkout\_src\_t *select* ) [inline], [static]

This function selects the clock source for the MCGOUTCLK.

### Parameters

|               |                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MCG instance.                                                                                                                                                                                                                                            |
| <i>select</i> | Clock source selection <ul style="list-style-type: none"> <li>• 00: Output of FLL or PLLCS is selected(depends on PLLS control bit)</li> <li>• 01: Internal reference clock is selected.</li> <li>• 10: External reference clock is selected.</li> <li>• 11: Reserved.</li> </ul> |

#### 42.2.9.10 static void CLOCK\_HAL\_SetClksFrdivIrefs ( MCG\_Type \* *base*, mcg\_clkout\_src\_t *clks*, uint8\_t *frdiv*, mcg\_fl\_src\_t *irefs* ) [inline], [static]

This function set the MCG\_C1[CLKS], MCG\_C1[FRDIV] and MCG\_C1[IREFS] at the same time, in order keep the integrity of the clock switching.

### Parameters

|              |                                        |
|--------------|----------------------------------------|
| <i>base</i>  | Base address for current MCG instance. |
| <i>clks</i>  | MCG_C1[CLKS].                          |
| <i>frdiv</i> | MCG_C1[FRDIV].                         |
| <i>irefs</i> | MCG_C1[IREFS].                         |

**42.2.9.11 static mcg\_clkout\_stat\_t CLOCK\_HAL\_GetClkOutStat ( MCG\_Type \* *base* )  
[inline], [static]**

This function gets the Clock Mode Status. These bits indicate the current clock mode. The CLKST bits do not update immediately after a write to the CLKS bits due to internal synchronization between clock domains.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

Clock Mode Status

- 00: Output of the FLL is selected (reset default).
- 01: Internal reference clock is selected.
- 10: External reference clock is selected.
- 11: Output of the PLL is selected.

**42.2.9.12 static void CLOCK\_HAL\_SetLowPowerModeCmd ( MCG\_Type \* *base*, bool *enable* ) [inline], [static]**

This function controls whether the FLL (or PLL) is disabled in the BLPI and the BLPE modes. In the FBE or the PBE modes, setting this bit to 1 transitions the MCG into the BLPE mode. In the FBI mode, setting this bit to 1 transitions the MCG into the BLPI mode. In any other MCG mode, the LP bit has no effect.

Parameters

|               |                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MCG instance.                                                                                                                                                                   |
| <i>enable</i> | Enable low power or not: <ul style="list-style-type: none"> <li>• true: FLL (or PLL) is not disabled in bypass modes</li> <li>• false: FLL (or PLL) is disabled in bypass modes (lower power)</li> </ul> |

## MCG HAL driver

**42.2.9.13 void CLOCK\_HAL\_PrepareOsc ( MCG\_Type \* *base*, mcg\_oscsel\_select\_t *setting* )**

This function set the OSCSEL, if external oscillator is used, it wait until it is stable. This function could be used to prepare the external clock source before switch to use.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current MCG instance. |
| <i>setting</i> | MCG OSC Clock Select Setting           |

**42.2.9.14 static mcg\_fll\_src\_t CLOCK\_HAL\_GetFllSrc ( MCG\_Type \* *base* ) [inline], [static]**

This function gets the Internal Reference Status. This bit indicates the current source for the FLL reference clock. The IREFST bit does not update immediately after a write to the IREFS bit due to internal synchronization between the clock domains.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

Internal Reference Status

- 0: Source of FLL reference clock is the external reference clock.
- 1: Source of FLL reference clock is the internal reference clock.

**42.2.9.15 static void CLOCK\_HAL\_SetFllFilterPreserveCmd ( MCG\_Type \* *base*, bool *enable* ) [inline], [static]**

This function sets the FLL Filter Preserve Enable. This bit prevents the FLL filter values from resetting allowing the FLL output frequency to remain the same during the clock mode changes where the FLL/-DCO output is still valid. (Note: This requires that the FLL reference frequency remain the same as the value prior to the new clock mode switch. Otherwise, the FLL filter and the frequency values change.)

## Parameters

|               |                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MCG instance.                                                                                                                                                                                                                                         |
| <i>enable</i> | FLL Filter Preserve Enable Setting <ul style="list-style-type: none"> <li>• true: FLL filter and FLL frequency retain their previous values during new clock mode change</li> <li>• false: FLL filter and FLL frequency will reset on changes to correct clock mode</li> </ul> |

**42.2.9.16 mcg\_status\_t CLOCK\_HAL\_GetAvailableFrdiv ( osc\_range\_t range0, mcg\_oscsel\_select\_t oscsel, uint32\_t inputFreq, uint8\_t \* frdiv )**

This function calculates the proper FRDIV setting according to the FLL reference clock. FLL reference clock frequency after FRDIV must be in the range of 31.25 kHz to 39.0625 kHz.

## Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <i>range0</i>    | RANGE0 setting.                             |
| <i>oscsel</i>    | OSCSEL setting.                             |
| <i>inputFreq</i> | The reference clock frequency before FRDIV. |
| <i>frdiv</i>     | FRDIV result.                               |

## Returns

Method return status.

## Return values

|                            |                             |
|----------------------------|-----------------------------|
| <i>kStatus_MCG_Success</i> | Proper FRDIV is got.        |
| <i>kStatus_MCG_Fail</i>    | Could not get proper FRDIV. |

**42.2.9.17 static void CLOCK\_HAL\_SetInternalRefClkEnableCmd ( MCG\_Type \* base, bool enable ) [inline], [static]**

This function enables/disables the internal reference clock to use as the MCGIRCLK.

## MCG HAL driver

### Parameters

|               |                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MCG instance.                                                                                                                    |
| <i>enable</i> | Enable or disable internal reference clock. <ul style="list-style-type: none"> <li>• true: MCGIRCLK active</li> <li>• false: MCGIRCLK inactive</li> </ul> |

#### 42.2.9.18 static void CLOCK\_HAL\_SetInternalRefClkEnableInStopCmd ( MCG\_Type \* *base*, bool *enable* ) [inline], [static]

This function controls whether or not the internal reference clock remains enabled when the MCG enters Stop mode.

### Parameters

|               |                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MCG instance.                                                                                                                                                                                                                                                                                           |
| <i>enable</i> | Enable or disable the internal reference clock stop setting. <ul style="list-style-type: none"> <li>• true: Internal reference clock is enabled in Stop mode if IRCLKEN is set or if MCG is in FEI, FBI, or BLPI modes before entering Stop mode.</li> <li>• false: Internal reference clock is disabled in Stop mode</li> </ul> |

#### 42.2.9.19 static void CLOCK\_HAL\_SetInternalRefClkMode ( MCG\_Type \* *base*, mcg\_irc\_mode\_t *mode* ) [inline], [static]

This function selects between the fast or slow internal reference clock source.

### Parameters

|             |                                                                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i> | Base address for current MCG instance.                                                                                                                                                |
| <i>mode</i> | Internal reference clock source. <ul style="list-style-type: none"> <li>• 0: Slow internal reference clock selected.</li> <li>• 1: Fast internal reference clock selected.</li> </ul> |

#### 42.2.9.20 **static mcg\_irc\_mode\_t CLOCK\_HAL\_GetInternalRefClkMode ( MCG\_Type \* *base* ) [inline], [static]**

This function gets the Internal Reference Clock Status. The IRCST bit indicates the current source for the internal reference clock select clock (IRCSCLK). The IRCST bit does not update immediately after a write to the IRCS bit due to the internal synchronization between clock domains. The IRCST bit is only updated if the internal reference clock is enabled, either by the MCG being in a mode that uses the IRC or by setting the C1[IRCLKEN] bit.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

Internal Reference Clock Status

- 0: Source of internal reference clock is the slow clock (32 kHz IRC).
- 1: Source of internal reference clock is the fast clock (2 MHz IRC).

#### 42.2.9.21 **void CLOCK\_HAL\_UpdateFastClkInternalRefDiv ( MCG\_Type \* *base*, uint8\_t *fcrdiv* )**

This function sets FCRDIV to a new value. FCRDIV cannot be changed when fast internal reference is enabled. If it is enabled, disable it , then set FCRDIV, and finally re enable it.

Parameters

|               |                                               |
|---------------|-----------------------------------------------|
| <i>base</i>   | Base address for current MCG instance.        |
| <i>fcrdiv</i> | Fast Clock Internal Reference Divider Setting |

#### 42.2.9.22 **void CLOCK\_HAL\_UpdateInternalRefClk ( MCG\_Type \* *base*, mcg\_irc\_mode\_t *ircs*, uint8\_t *fcrdiv*, bool *enableInStop* )**

This function setups the MCGIRCLK base on parameters. It selects the IRC source, if fast IRC is used, this function also sets the fast IRC divider. This function also sets whether enable MCGIRCLK in stop mode.

## MCG HAL driver

### Parameters

|                     |                                                |
|---------------------|------------------------------------------------|
| <i>base</i>         | Base address for current MCG instance.         |
| <i>ircs</i>         | MCGIRCLK clock source, choose fast or slow.    |
| <i>fcrdiv</i>       | Fast Clock Internal Reference Divider Setting. |
| <i>enableInStop</i> | MCGIRCLK enable in stop mode or not.           |

#### 42.2.9.23 void CLOCK\_HAL\_SetOsc0Mode ( MCG\_Type \* *base*, osc\_range\_t *range*, osc\_gain\_t *hgo*, osc\_src\_t *erefs* )

This function sets the OSC0 work mode, include frequency range select, high gain oscillator select, and external reference select.

### Parameters

|              |                                        |
|--------------|----------------------------------------|
| <i>base</i>  | Base address for current MCG instance. |
| <i>range</i> | Frequency range select.                |
| <i>hgo</i>   | High gain oscillator select.           |
| <i>erefs</i> | External reference select.             |

#### 42.2.9.24 static bool CLOCK\_HAL\_IsOsc0Stable ( MCG\_Type \* *base* ) [inline], [static]

This function gets the OSC Initialization Status. This bit, which resets to 0, is set to 1 after the initialization cycles of the crystal oscillator clock have completed. After being set, the bit is cleared to 0 if the OSC is subsequently disabled. See the OSC module's detailed description for more information.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

### Returns

True if OSC0 is stable.

#### 42.2.9.25 void CLOCK\_HAL\_EnableOsc0Monitor ( MCG\_Type \* *base*, mcg\_osc\_monitor\_mode\_t *mode* )

This function enables the loss of clock monitoring circuit for the OSC0 external reference mux select. The monitor mode determines whether an interrupt or a reset request is generated following a loss of the

OSC0 indication. External clock monitor should only be enabled when the MCG is in an operational mode that uses the external clock (FEE, FBE, PEE, PBE, or BLPE). Whenever the monitor is enabled, the value of the RANGE0 bits in the C2 register should not be changed. External clock monitor should be disabled before the MCG enters any Stop mode. Otherwise, a reset request may occur while in Stop mode. External clock monitor should also be disabled before entering VLPR or VLPW power modes if the MCG is in BLPE mode.

Parameters

|             |                                                     |
|-------------|-----------------------------------------------------|
| <i>base</i> | Base address for current MCG instance.              |
| <i>mode</i> | Generate interrupt or reset when OSC loss detected. |

#### 42.2.9.26 **static void CLOCK\_HAL\_DisableOsc0Monitor ( MCG\_Type \* *base* )** **[inline], [static]**

This function disables the loss of clock monitoring circuit for the OSC0 external reference mux select.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

#### 42.2.9.27 **static bool CLOCK\_HAL\_IsOsc0MonitorEnabled ( MCG\_Type \* *base* )** **[inline], [static]**

This function checks whether the loss of clock monitoring circuit for the OSC0 external reference mux select is enabled or not.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

True if monitor is enabled.

#### 42.2.9.28 **static bool CLOCK\_HAL\_IsOsc0LostLock ( MCG\_Type \* *base* )** **[inline], [static]**

This function gets the OSC0 Loss of Clock Status. The LOCS0 indicates when a loss of OSC0 reference clock has occurred. The LOCS0 bit only has an effect when CME0 is set.

## MCG HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

### Returns

True if loss of OSC0 has occurred.

#### 42.2.9.29 **static void** CLOCK\_HAL\_ClearOsc0LostLock ( MCG\_Type \* *base* ) [**inline**], [**static**]

This function clears the OSC0 Loss of Clock Status.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

#### 42.2.9.30 **mcg\_atm\_error\_t** CLOCK\_HAL\_TrimInternalRefClk ( MCG\_Type \* *base*, **uint32\_t** *extFreq*, **uint32\_t** *desireFreq*, **uint32\_t** \* *actualFreq*, **mcg\_atm\_select\_t** *atms* )

This function trims the internal reference clock using external clock. If successful, it returns the kMcg-AtmErrorNone and the frequency after trimming is received in the parameter *actualFreq*. If an error occurs, the error code is returned.

### Parameters

|                   |                                                |
|-------------------|------------------------------------------------|
| <i>base</i>       | Base address for current MCG instance.         |
| <i>extFreq</i>    | External clock frequency, should be bus clock. |
| <i>desireFreq</i> | Frequency want to trim to.                     |
| <i>actualFreq</i> | Actual frequency after trim.                   |
| <i>atms</i>       | Trim fast or slow internal reference clock.    |

### Returns

Return kMcgAtmErrorNone if success, otherwise return error code.

#### 42.2.9.31 **static bool** CLOCK\_HAL\_IsAutoTrimMachineFailed ( MCG\_Type \* *base* ) [**inline**], [**static**]

This function gets the Automatic Trim machine Fail Flag. This bit asserts when the Automatic Trim Machine is enabled (ATME=1) and a write to the C1, C3, C4, and SC registers is detected or the MCG enters into a Stop mode. Writing to ATMF clears the flag.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

True if ATM failed.

**42.2.9.32 static void CLOCK\_HAL\_ClearAutoTrimMachineFailed ( MCG\_Type \* *base* )  
[inline], [static]**

This function clears the Automatic Trim machine Fail Flag.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

**42.2.9.33 mcg\_modes\_t CLOCK\_HAL\_GetMcgMode ( MCG\_Type \* *base* )**

This function checks the MCG registers and determine current MCG mode.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

Current MCG mode or error code mcg\_modes\_t

**42.2.9.34 mcg\_mode\_error\_t CLOCK\_HAL\_SetFeiMode ( MCG\_Type \* *base*,  
mcg\_dco\_range\_select\_t *drs*, void(\*)*(void) fllStableDelay* )**

This function sets the MCG to FEI mode.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

## MCG HAL driver

|                      |                                            |
|----------------------|--------------------------------------------|
| <i>drs</i>           | The DCO range selection.                   |
| <i>flStableDelay</i> | Delay function to make sure FLL is stable. |

Returns

Error code

**42.2.9.35** `mcg_mode_error_t CLOCK_HAL_SetFeeMode ( MCG_Type * base,  
mcg_oscsel_select_t oscselVal, uint8_t frdivVal, mcg_dmx32_select_t dmx32,  
mcg_dco_range_select_t drs, void(*)(void) flStableDelay )`

This function sets the MCG to FEE mode.

Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <i>base</i>          | Base address for current MCG instance.     |
| <i>oscselval</i>     | OSCSEL in FEE mode.                        |
| <i>frdivVal</i>      | FRDIV in FEE mode.                         |
| <i>dmx32</i>         | DMX32 in FEE mode.                         |
| <i>drs</i>           | The DCO range selection.                   |
| <i>flStableDelay</i> | Delay function to make sure FLL is stable. |

Returns

Error code

**42.2.9.36** `mcg_mode_error_t CLOCK_HAL_SetFbiMode ( MCG_Type * base,  
mcg_dco_range_select_t drs, mcg_irc_mode_t ircSelect, uint8_t fcrdivVal,  
void(*)(void) flStableDelay )`

This function sets the MCG to FBI mode.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

|                      |                                            |
|----------------------|--------------------------------------------|
| <i>drs</i>           | The DCO range selection.                   |
| <i>ircselect</i>     | The internal reference clock to select.    |
| <i>flStableDelay</i> | Delay function to make sure FLL is stable. |

Returns

Error code

**42.2.9.37** `mcg_mode_error_t CLOCK_HAL_SetFbeMode ( MCG_Type * base,  
mcg_oscsel_select_t oscselVal, uint8_t frdivVal, mcg_dmx32_select_t dmx32,  
mcg_dco_range_select_t drs, void(*)(void) flStableDelay )`

This function sets the MCG to FBE mode.

Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <i>base</i>          | Base address for current MCG instance.     |
| <i>oscselval</i>     | OSCSEL in FEE mode.                        |
| <i>frdivVal</i>      | FRDIV in FEE mode.                         |
| <i>dmx32</i>         | DMX32 in FEE mode.                         |
| <i>drs</i>           | The DCO range selection.                   |
| <i>flStableDelay</i> | Delay function to make sure FLL is stable. |

Returns

Error code

**42.2.9.38** `mcg_mode_error_t CLOCK_HAL_SetBlpiMode ( MCG_Type * base, uint8_t  
fcrdivVal, mcg_irc_mode_t ircSelect )`

This function sets the MCG to BLPI mode.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

## MCG HAL driver

|                  |                                         |
|------------------|-----------------------------------------|
| <i>ircselect</i> | The internal reference clock to select. |
|------------------|-----------------------------------------|

Returns

Error code

### 42.2.9.39 `mcg_mode_error_t` **CLOCK\_HAL\_SetBlpeMode** ( `MCG_Type` \* *base*, `mcg_oscsel_select_t` *oscselVal* )

This function sets the MCG to BLPE mode.

Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <i>base</i>      | Base address for current MCG instance. |
| <i>oscselval</i> | OSCSEL in FEE mode.                    |

Returns

Error code

### 42.2.9.40 `mcg_mode_error_t` **CLOCK\_HAL\_SetPbeMode** ( `MCG_Type` \* *base*, `mcg_oscsel_select_t` *oscselVal*, `mcg_pll_clk_select_t` *pllcsSelect*, `uint8_t` *prdivVal*, `uint8_t` *vdivVal* )

This function sets the MCG to PBE mode.

Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| <i>base</i>        | Base address for current MCG instance. |
| <i>oscselVal</i>   | OSCSEL in PBE mode.                    |
| <i>pllcsSelect</i> | PLLCS in PBE mode.                     |
| <i>prdivVal</i>    | PRDIV in PBE mode.                     |
| <i>vdivVal</i>     | VDIV in PBE mode.                      |

Returns

Error code

### 42.2.9.41 `mcg_mode_error_t` **CLOCK\_HAL\_SetPeeMode** ( `MCG_Type` \* *base* )

This function sets the MCG to PBE mode.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current MCG instance. |
|-------------|----------------------------------------|

Returns

Error code

Note

This function only change CLKS to use PLL/FLL output. If the PRDIV/VDIV are different from PBE mode, please setup these settings in PBE mode and wait for stable then switch to PEE mode.

---

## Chapter 43

# Multipurpose Clock Generator Lite (MCG\_Lite)

### 43.1 Overview

The Kinetis SDK provides the HAL drivers for the Multipurpose Clock Generator (MCG) Lite block of Kinetis devices.

### Modules

- [MCG\\_Lite HAL driver](#)

## MCG\_Lite HAL driver

### 43.2 MCG\_Lite HAL driver

#### 43.2.1 Overview

The section describes the programming interface of the MCGLite HAL driver. The multi-purpose clock generator Lite (MCG\_Lite) module provides several clock source choices for the MCU. The MCG\_Lite HAL provides a set of APIs to access these registers.

#### 43.2.2 Get current clock output

The MCG\_Lite HAL provides a set of APIs, which are dedicated to getting the different clock frequency, such as MCGOUTCLK, MCGPCLK, MCGIRCLK and LIRC\_CLK. Ensure that the mode setting registers have been configured properly. Otherwise, the API functions are provided with an invalid value.

This example shows how to get a default system reference clock:

```
#include "fsl_mcglite_hal.h"

// return frequency value for specified clock name
uint32_t frequency = 0;

// get the current system default reference clock frequency
frequency = CLOCK_HAL_GetOutClk();
```

#### 43.2.3 Clock mode switching

MCG\_Lite HAL provides API functions to switch between different clock modes. Before switching, ensure that the operation is valid. For example, a direct switch between the LIRC8M and the LIRC2M is not allowed. Therefore, before switching to the LIRC8M, ensure that the current mode is not LIRC2M.

*Sets the low internal reference divider 2.*
- static void [CLOCK\\_HAL\\_SetLircCmd](#) (MCG\_Type \*base, bool enable)  
*Enables the Low Internal Reference Clock setting.*
- static void [CLOCK\\_HAL\\_SetLircStopCmd](#) (MCG\_Type \*base, bool enable)  
*Sets the Low Internal Reference Clock disabled or not in STOP mode.*
- static void [CLOCK\\_HAL\\_SetHircCmd](#) (MCG\_Type \*base, bool enable)  
*Enable or disable the High Internal Reference Clock setting.*
- static void [CLOCK\\_HAL\\_SetExtRefSelMode0](#) (MCG\_Type \*base, osc\_src\_t select)  
*Sets the External Reference Select.*
- static mcglite\_mcgoutclk\_source\_t [CLOCK\\_HAL\\_GetClkSrcStat](#) (MCG\_Type \*base)  
*Gets the Clock Mode Status.*
- static bool [CLOCK\\_HAL\\_IsOscStable](#) (MCG\_Type \*base)  
*Gets the OSC Initialization Status.*

## MCG\_Lite clock mode API

- mcglite\_mode\_t [CLOCK\\_HAL\\_GetMode](#) (MCG\_Type \*base)  
*Gets the current MCG\_Lite clock mode.*
- mcglite\_mode\_error\_t [CLOCK\\_HAL\\_SetHircMode](#) (MCG\_Type \*base)  
*Sets the MCG\_Lite to HIRC mode.*
- mcglite\_mode\_error\_t [CLOCK\\_HAL\\_SetLircMode](#) (MCG\_Type \*base, mcglite\_lirc\_select\_t lirc, mcglite\_lirc\_div\_t div1)  
*Sets the MCG\_Lite to LIRC mode.*

- `mcglite_mode_error_t CLOCK_HAL_SetExtMode` (MCG\_Type \*base)  
Sets the MCG\_Lite to EXT mode.

## 43.2.4 Enumeration Type Documentation

### 43.2.4.1 enum \_mcglite\_constant

#### 43.2.4.2 enum mcglite\_mcgoutclk\_source\_t

Enumerator

- kMcgliteClkSrcHirc* MCGOUTCLK source is HIRC.
- kMcgliteClkSrcLirc* MCGOUTCLK source is LIRC.
- kMcgliteClkSrcExt* MCGOUTCLK source is external clock source.

#### 43.2.4.3 enum mcglite\_lirc\_select\_t

Enumerator

- kMcgliteLircSel2M* slow internal reference(LIRC) 2 MHz clock selected
- kMcgliteLircSel8M* slow internal reference(LIRC) 8 MHz clock selected

#### 43.2.4.4 enum mcglite\_lirc\_div\_t

Enumerator

- kMcgliteLircDivBy1* divider is 1
- kMcgliteLircDivBy2* divider is 2
- kMcgliteLircDivBy4* divider is 4
- kMcgliteLircDivBy8* divider is 8
- kMcgliteLircDivBy16* divider is 16
- kMcgliteLircDivBy32* divider is 32
- kMcgliteLircDivBy64* divider is 64
- kMcgliteLircDivBy128* divider is 128

#### 43.2.4.5 enum osc\_src\_t

Enumerator

- kOscSrcExt* External reference clock requested.
- kOscSrcOsc* Oscillator requested.
- kOscSrcExt* Selects external input clock.
- kOscSrcOsc* Selects Oscillator.

## MCG\_Lite HAL driver

### 43.2.4.6 enum osc\_range\_t

Enumerator

*kOscRangeLow* Low frequency range selected for the crystal OSC.  
*kOscRangeHigh* High frequency range selected for the crystal OSC.  
*kOscRangeVeryHigh* Very High frequency range selected for the crystal OSC.  
*kOscRangeVeryHigh1* Very High frequency range selected for the crystal OSC.  
*kOscRangeLow* Low frequency range selected for the crystal OSC.  
*kOscRangeHigh* High frequency range selected for the crystal OSC.  
*kOscRangeVeryHigh* Very High frequency range selected for the crystal OSC.  
*kOscRangeVeryHigh1* Very High frequency range selected for the crystal OSC.

### 43.2.4.7 enum osc\_gain\_t

Enumerator

*kOscGainLow* Configure crystal oscillator for low-power operation.  
*kOscGainHigh* Configure crystal oscillator for high-gain operation.  
*kOscGainLow* Configure crystal oscillator for low-power operation.  
*kOscGainHigh* Configure crystal oscillator for high-gain operation.

### 43.2.4.8 enum mcglite\_mode\_t

Enumerator

*kMcgliteModeHirc48M* clock mode is HIRC 48M  
*kMcgliteModeLirc8M* clock mode is LIRC 8M  
*kMcgliteModeLirc2M* clock mode is LIRC 2M  
*kMcgliteModeExt* clock mode is EXT  
*kMcgliteModeLirc* clock mode is LIRC 2M or 8M  
*kMcgliteModeStop* clock mode is STOP  
*kMcgliteModeError* Unknown mode.

### 43.2.4.9 enum mcglite\_mode\_error\_t

Enumerator

*kMcgliteModeErrNone* • No error  
*kMcgliteModeErrExt* • External clock source not available.

## 43.2.5 Function Documentation

### 43.2.5.1 uint32\_t CLOCK\_HAL\_GetPeripheralClk ( MCG\_Type \* *base* )

This function returns the MCGPCLK frequency (Hertz) based on the current MCG\_Lite configurations and settings. The configuration should be properly done in order to get the valid value.

## MCG\_Lite HAL driver

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

### Returns

Frequency value in Hertz of MCGPCLK.

### 43.2.5.2 uint32\_t CLOCK\_HAL\_GetLircClk ( MCG\_Type \* *base* )

This function returns the MCG\_Lite LIRC frequency (Hertz) based on the current MCG\_Lite configurations and settings. Ensure that the LIRC has been properly configured to get the valid value.

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

### Returns

Frequency value in Hertz of the MCG\_Lite LIRC.

### 43.2.5.3 uint32\_t CLOCK\_HAL\_GetLircDiv1Clk ( MCG\_Type \* *base* )

This function returns the MCG\_Lite LIRC\_DIV1\_CLK frequency (Hertz) based on the current MCG\_Lite configurations and settings. Ensure that the LIRC has been properly configured to get the valid value.

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

### Returns

Frequency value in Hertz of the MCG\_Lite LIRC\_DIV1\_CLK.

### 43.2.5.4 uint32\_t CLOCK\_HAL\_GetInternalRefClk ( MCG\_Type \* *base* )

This function returns the MCGIRCLK frequency (Hertz) based on the current MCG\_Lite configurations and settings. Ensure that the LIRC has been properly configured to get the valid value.

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

Returns

Frequency value in Hertz of MCGIRCLK.

**43.2.5.5 uint32\_t CLOCK\_HAL\_GetOutClk ( MCG\_Type \* *base* )**

This function returns the MCGOUTCLK frequency (Hertz) based on the current MCG\_Lite configurations and settings. The configuration should be properly done to get the valid value.

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

Returns

Frequency value in Hertz of MCGOUTCLK.

**43.2.5.6 static void CLOCK\_HAL\_SetLircSelMode ( MCG\_Type \* *base*, mcglite\_lirc\_select\_t *select* ) [inline], [static]**

This function sets the LIRC to work at 2 MHz or 8 MHz.

Parameters

|               |                                 |
|---------------|---------------------------------|
| <i>base</i>   | MCG_Lite register base address. |
| <i>select</i> | 2MHz or 8MHz.                   |

**43.2.5.7 static void CLOCK\_HAL\_SetLircRefDiv ( MCG\_Type \* *base*, mcglite\_lirc\_div\_t *setting* ) [inline], [static]**

This function sets the low internal reference divider 1, the register FCRDIV.

Parameters

---

## MCG\_Lite HAL driver

|                |                                 |
|----------------|---------------------------------|
| <i>base</i>    | MCG_Lite register base address. |
| <i>setting</i> | LIRC divider 1 setting value.   |

### 43.2.5.8 static void CLOCK\_HAL\_SetLircDiv2 ( MCG\_Type \* *base*, mcglite\_lirc\_div\_t *setting* ) [inline], [static]

This function sets the low internal reference divider 2.

Parameters

|                |                                 |
|----------------|---------------------------------|
| <i>base</i>    | MCG_Lite register base address. |
| <i>setting</i> | LIRC divider 2 setting value.   |

### 43.2.5.9 static void CLOCK\_HAL\_SetLircCmd ( MCG\_Type \* *base*, bool *enable* ) [inline], [static]

This function enables/disables the low internal reference clock.

Parameters

|               |                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | MCG_Lite register base address.                                                                                                                                               |
| <i>enable</i> | Enable or disable internal reference clock. <ul style="list-style-type: none"> <li>• true: MCG_Lite Low IRCLK active</li> <li>• false: MCG_Lite Low IRCLK inactive</li> </ul> |

### 43.2.5.10 static void CLOCK\_HAL\_SetLircStopCmd ( MCG\_Type \* *base*, bool *enable* ) [inline], [static]

This function controls whether or not the low internal reference clock remains enabled when the MCG\_Lite enters STOP mode.

Parameters

|               |                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | MCG_Lite register base address.                                                                                                                                                                                                                                                              |
| <i>enable</i> | Enable or disable low internal reference clock stop setting. <ul style="list-style-type: none"> <li>• true: Internal reference clock is enabled in stop mode if IRCLKEN is set before entering STOP mode.</li> <li>• false: Low internal reference clock is disabled in STOP mode</li> </ul> |

```
43.2.5.11 static void CLOCK_HAL_SetHircCmd (MCG_Type * base, bool enable)
 [inline], [static]
```

This function enables/disables the internal reference clock for use as MCGPCLK.

## MCG\_Lite HAL driver

### Parameters

|               |                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | MCG_Lite register base address.                                                                                                                 |
| <i>enable</i> | Enable or disable HIRC. <ul style="list-style-type: none"> <li>• true: MCG_Lite HIRC active</li> <li>• false: MCG_Lite HIRC inactive</li> </ul> |

### 43.2.5.12 static void CLOCK\_HAL\_SetExtRefSelMode0 ( MCG\_Type \* *base*, osc\_src\_t *select* ) [inline], [static]

This function selects the source for the external reference clock. Refer to the Oscillator (OSC) for more details.

### Parameters

|               |                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | MCG_Lite register base address.                                                                                                                  |
| <i>select</i> | External Reference Select. <ul style="list-style-type: none"> <li>• 0: External input clock requested</li> <li>• 1: Crystal requested</li> </ul> |

### 43.2.5.13 static mcglite\_mcgoutclk\_source\_t CLOCK\_HAL\_GetClkSrcStat ( MCG\_Type \* *base* ) [inline], [static]

This function gets the Clock Mode Status. These bits indicate the current clock mode. The CLKST bits do not update immediately after a write to the CLKS bits because of the internal synchronization between clock domains.

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

### Returns

status Clock Mode Status

- 00: HIRC clock is select.
- 01: LIRC(low Internal reference clock) is selected.
- 10: External reference clock is selected.
- 11: Reserved.

#### 43.2.5.14 `static bool CLOCK_HAL_IsOscStable ( MCG_Type * base ) [inline], [static]`

This function gets the OSC Initialization Status OSCINIT0. This bit, which resets to 0, is set to 1 after the initialization cycles of the crystal oscillator clock have completed. After being set, the bit is cleared to 0 if the OSC is subsequently disabled. See the OSC module's detailed description for more information.

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

Returns

OSC initialization status

#### 43.2.5.15 `mcglite_mode_t CLOCK_HAL_GetMode ( MCG_Type * base )`

This is an internal function that checks the MCG registers and determines the current MCG\_lite mode.

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

Returns

Current MCG\_Lite mode or error code.

#### 43.2.5.16 `mcglite_mode_error_t CLOCK_HAL_SetHircMode ( MCG_Type * base )`

This is an internal function that sets MCG\_Lite to HRIC mode.

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

Returns

Error code.

#### 43.2.5.17 `mcglite_mode_error_t CLOCK_HAL_SetLircMode ( MCG_Type * base, mcglite_lirc_select_t lirc, mcglite_lirc_div_t div1 )`

This is an internal function that sets MCG\_Lite to LIRC mode.

## MCG\_Lite HAL driver

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
| <i>lirc</i> | Set to LIRC2M or LIRC8M.        |
| <i>div1</i> | The FCRDIV setting.             |

### Returns

Error code.

### 43.2.5.18 mcglite\_mode\_error\_t CLOCK\_HAL\_SetExtMode ( MCG\_Type \* *base* )

This is an internal function that sets MCG\_Lite to EXT mode. Before calling this function, ensure that either the OSC or external clock source is ready.

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | MCG_Lite register base address. |
|-------------|---------------------------------|

### Returns

Error code.

## Chapter 44

# Memory Mapped Arithmetic Unit (MMAU)

### 44.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Memory Mapped Arithmetic Unit(MMAU) block of Kinetis devices.

#### Modules

- [Fractional Data Types](#)
- [MMAU HAL driver](#)
- [MMAU Hardware Abstraction Layer](#)
- [MMAU peripheral driver](#)

## MMAU HAL driver

### 44.2 MMAU HAL driver

#### 44.2.1 Overview

This section describes the programming interface of the MMAU HAL instructions.

#### Modules

- [Fractional Operands](#)
- [Signed Integer Operands](#)
- [Unsigned Integer Operands](#)

## 44.3 MMAU Hardware Abstraction Layer

### 44.3.1 Overview

This section describes the programming interface of the MMAU HAL driver.

#### Modules

- [MMAU Instruction Result Flags](#)
- [MMAU Interrupt Flags](#)
- [MMAU Interrupt Sources](#)

#### Files

- file [fsl\\_mmau\\_hal.h](#)

#### Data Structures

- struct [mmau\\_user\\_config\\_t](#)  
*Defines the structure to configure the MMAU. [More...](#)*
- struct [mmau\\_reg\\_state\\_t](#)  
*Defines the structure to hold states of the MMAU registers. [More...](#)*

#### Macros

- #define [MMAU\\_HAL\\_StoreRegStateCmd](#)(base) volatile [mmau\\_reg\\_state\\_t](#) tmp; [\\_store\\_mmau\\_state](#)(base, &tmp)  
*Stores the MMAU operand and control registers to the software stack.*
- #define [MMAU\\_HAL\\_RestoreRegStateCmd](#)(base) [\\_restore\\_mmau\\_reg\\_state](#)(base, &tmp)  
*Restores the MMAU operand and control registers from the software stack.*

#### Enumerations

- enum [mmau\\_status\\_t](#) {  
    [kStatus\\_MMAU\\_Success](#) = 0U,  
    [kStatus\\_MMAU\\_InvalidArgument](#) = 1U,  
    [kStatus\\_MMAU\\_Failed](#) = 2U }  
*MMAU status return codes.*

#### Functions

- void [MMAU\\_HAL\\_Init](#) (MMAU\_Type \*base)

## MMAU Hardware Abstraction Layer

- Resets the control/status register into a reset state.*

  - void **MMAU\_HAL\_Config** (MMAU\_Type \*base, const **mmau\_user\_config\_t** \*configStructPtr)  
*Configures the MMAU.*
  - static void **MMAU\_HAL\_SetIntCmd** (MMAU\_Type \*base, uint32\_t mask)  
*Sets the interrupt request sources.*
  - static uint32\_t **MMAU\_HAL\_GetInstrFlagsCmd** (MMAU\_Type \*base)  
*Gets the instruction result flags.*
  - static void **MMAU\_HAL\_WriteInstrFlagsCmd** (MMAU\_Type \*base, uint32\_t mask)  
*Writes the instruction result flags.*
  - static uint32\_t **MMAU\_HAL\_GetStateCmd** (MMAU\_Type \*base)  
*Gets MMAU state.*
  - static uint32\_t **MMAU\_HAL\_GetIntStatusFlagsCmd** (MMAU\_Type \*base)  
*Gets interrupt flags.*
  - static void **MMAU\_HAL\_ConfigStateCmd** (MMAU\_Type \*base, uint32\_t state)  
*Configures MMAU state.*
  - static void **MMAU\_HAL\_ClearIntStatusFlagsCmd** (MMAU\_Type \*base, uint32\_t mask)  
*Clears the interrupt flags.*
  - static void **MMAU\_HAL\_SetDmaCmd** (MMAU\_Type \*base, bool enable)  
*Asserts the DMA request when in IDLE (not busy) state.*
  - static void **MMAU\_HAL\_SetSupervisorOnlyCmd** (MMAU\_Type \*base, bool enable)  
*Sets access mode to the MMAU operand accumulator and control/status registers.*
  - static uint32\_t **MMAU\_HAL\_GetHwRevCmd** (MMAU\_Type \*base)  
*Gets the hardware revision level.*
  - static void **\_store\_mmau\_state** (MMAU\_Type \*base, volatile **mmau\_reg\_state\_t** \*p)  
*Stores the MMAU operand and the control registers.*
  - static void **\_restore\_mmau\_reg\_state** (MMAU\_Type \*base, volatile **mmau\_reg\_state\_t** \*p)  
*Restores the MMAU operand and control registers.*

### 44.3.2 Data Structure Documentation

#### 44.3.2.1 struct mmau\_user\_config\_t

##### Data Fields

- uint32\_t **mmauIntReqMask**  
*Enable interrupt request sources: INT\_MMAU\_QIE|INT\_MMAU\_VIE|INT\_MMAU\_DZIE.*
- bool **mmauDmaReq**  
*Enable (true) or disable (false) DMA request when MMAU is in IDLE (not busy) state.*
- bool **mmauAccess**  
*MMAU registers can only be accessed in Supervisor Mode (true) or in both User Mode or Supervisor Mode (false).*

#### 44.3.2.2 struct mmau\_reg\_state\_t

##### Data Fields

- uint32\_t **x0**  
*X0 Operand Register.*

- uint32\_t **x1**  
*X1 Operand Register.*
- uint32\_t **x2**  
*X2 Operand Register.*
- uint32\_t **x3**  
*X3 Operand Register.*
- uint32\_t **a0**  
*A0 Accumulator Register.*
- uint32\_t **a1**  
*A1 Accumulator Register.*
- uint32\_t **csr**  
*CSR Control/Status Register.*

#### 44.3.2.2.0.1 Field Documentation

44.3.2.2.0.1.1 uint32\_t mmau\_reg\_state\_t::x0

44.3.2.2.0.1.2 uint32\_t mmau\_reg\_state\_t::x1

44.3.2.2.0.1.3 uint32\_t mmau\_reg\_state\_t::x2

44.3.2.2.0.1.4 uint32\_t mmau\_reg\_state\_t::x3

44.3.2.2.0.1.5 uint32\_t mmau\_reg\_state\_t::a0

44.3.2.2.0.1.6 uint32\_t mmau\_reg\_state\_t::a1

44.3.2.2.0.1.7 uint32\_t mmau\_reg\_state\_t::csr

#### 44.3.3 Macro Definition Documentation

**44.3.3.1 #define MMAU\_HAL\_StoreRegStateCmd( *base* ) volatile mmau\_reg\_state\_t tmp; \_store\_mmau\_state(base, &tmp)**

This function stores the MMAU operand and control registers to the software stack. Call this function at the interrupt service routine entry.

Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | Peripheral MMAU base pointer. |
|-------------|-------------------------------|

**44.3.3.2 #define MMAU\_HAL\_RestoreRegStateCmd( *base* ) \_restore\_mmau\_reg\_state(base, &tmp)**

This function restores the MMAU operand and control registers from the software stack. Call this function at exit the interrupt service routine.

## MMAU Hardware Abstraction Layer

Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | Peripheral MMAU base pointer. |
|-------------|-------------------------------|

### 44.3.4 Enumeration Type Documentation

#### 44.3.4.1 enum mmau\_status\_t

Enumerator

- kStatus\_MMAU\_Success* Success.
- kStatus\_MMAU\_InvalidArgument* Invalid argument existed.
- kStatus\_MMAU\_Failed* Execution failed.

### 44.3.5 Function Documentation

#### 44.3.5.1 void MMAU\_HAL\_Init ( MMAU\_Type \* *base* )

This function resets the control/status register to a known state. This state is defined in a Reference Manual, which is power on reset value. This function must execute in a Supervisor Mode.

Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | Peripheral MMAU base pointer. |
|-------------|-------------------------------|

#### 44.3.5.2 void MMAU\_HAL\_Config ( MMAU\_Type \* *base*, const mmau\_user\_config\_t \* *configStructPtr* )

This function configures the MMAU.

Parameters

|                        |                               |
|------------------------|-------------------------------|
| <i>base</i>            | Peripheral MMAU base pointer. |
| <i>configStructPtr</i> | MMAU configuration structure. |

#### 44.3.5.3 static void MMAU\_HAL\_SetIntCmd ( MMAU\_Type \* *base*, uint32\_t *mask* ) [inline], [static]

This function sets the interrupt request sources.

Parameters

|             |                                                                                      |
|-------------|--------------------------------------------------------------------------------------|
| <i>base</i> | Peripheral MMAU base pointer.                                                        |
| <i>mask</i> | Mask of the MMAU interrupts to be enabled (INT_MMAU_QIE INT_MMAU_VIE INT_MMAU_DZIE). |

**44.3.5.4 static uint32\_t MMAU\_HAL\_GetInstrFlagsCmd ( MMAU\_Type \* *base* )  
[inline], [static]**

This function gets the instruction result flags. Instruction result flags are updated by the MMAU after the computation of each instruction.

Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | Peripheral MMAU base pointer. |
|-------------|-------------------------------|

Returns

Mask of the instruction result flags (INS\_MMAU\_Q|INS\_MMAU\_V|INS\_MMAU\_DZ|INS\_MMAU\_N).

**44.3.5.5 static void MMAU\_HAL\_WriteInstrFlagsCmd ( MMAU\_Type \* *base*, uint32\_t  
*mask* ) [inline], [static]**

This function writes the instruction result flags.

Parameters

|             |                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------|
| <i>base</i> | Peripheral MMAU base pointer.                                                                      |
| <i>mask</i> | Mask of the instruction result flags to be written (INS_MMAU_Q INS_MMAU_V INS_MMAU_DZ INS_MMAU_N). |

**44.3.5.6 static uint32\_t MMAU\_HAL\_GetStateCmd ( MMAU\_Type \* *base* ) [inline],  
[static]**

This function gets the state of the MMAU. It returns control/status register value.

## MMAU Hardware Abstraction Layer

Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | Peripheral MMAU base pointer. |
|-------------|-------------------------------|

Returns

Control/status register value.

**44.3.5.7 static uint32\_t MMAU\_HAL\_GetIntStatusFlagsCmd ( MMAU\_Type \* *base* )  
[inline], [static]**

This function gets the interrupt flags.

Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | Peripheral MMAU base pointer. |
|-------------|-------------------------------|

Returns

Mask of the asserted interrupt flags (INT\_MMAU\_QIF|INT\_MMAU\_VIF|INT\_MMAU\_DZIF).

**44.3.5.8 static void MMAU\_HAL\_ConfigStateCmd ( MMAU\_Type \* *base*, uint32\_t *state* )  
[inline], [static]**

This function configures MMAU state. It writes state into the control interrupt flag clear register.

Parameters

|              |                               |
|--------------|-------------------------------|
| <i>state</i> | Value of a state of the MMAU. |
| <i>base</i>  | Peripheral MMAU base pointer. |

**44.3.5.9 static void MMAU\_HAL\_ClearIntStatusFlagsCmd ( MMAU\_Type \* *base*, uint32\_t  
*mask* ) [inline], [static]**

This function clears the interrupt flags.

Parameters

---

|             |                                                                                       |
|-------------|---------------------------------------------------------------------------------------|
| <i>base</i> | Peripheral MMAU base pointer.                                                         |
| <i>mask</i> | Mask of the MMAU interrupts to be cleared (INT_MMAU_QIF INT_MMAU_VIF -INT_MMAU_DZIF). |

Note

This function preserves instruction result flags.

**44.3.5.10 static void MMAU\_HAL\_SetDmaCmd ( MMAU\_Type \* *base*, bool *enable* ) [inline], [static]**

This function asserts the DMA request when in IDLE (not busy) state. After it is enabled, the DMA request is asserted when the BUSY flag is cleared.

Parameters

|               |                                                                   |
|---------------|-------------------------------------------------------------------|
| <i>base</i>   | Peripheral MMAU base pointer.                                     |
| <i>enable</i> | Bool value for enabling (true) or disabling (false) DMA function. |

**44.3.5.11 static void MMAU\_HAL\_SetSupervisorOnlyCmd ( MMAU\_Type \* *base*, bool *enable* ) [inline], [static]**

This function sets access mode to the MMAU operand, control, and status registers.

Parameters

|               |                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Peripheral MMAU base pointer.                                                                                  |
| <i>enable</i> | MMAU registers can only be accessed in Supervisor Mode (true) or in both User Mode or Supervisor Mode (false). |

**44.3.5.12 static uint32\_t MMAU\_HAL\_GetHwRevCmd ( MMAU\_Type \* *base* ) [inline], [static]**

This function gets the hardware revision level of the MMAU. It returns HDR field of the control/status register.

## MMAU Hardware Abstraction Layer

### Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | Peripheral MMAU base pointer. |
|-------------|-------------------------------|

### Returns

uint32\_t hardware revision level.

**44.3.5.13 static void \_store\_mmau\_state ( MMAU\_Type \* *base*, volatile mmau\_reg\_state\_t \* *p* ) [inline], [static]**

This function stores MMAU operand and the control registers to the parameter *p*.

### Parameters

|             |                                                       |
|-------------|-------------------------------------------------------|
| <i>base</i> | Peripheral MMAU base pointer.                         |
| <i>p</i>    | Pointer to the structure to store the MMAU registers. |

### Note

This is an internal used function, it is recommend to use the function [MMAU\\_HAL\\_StoreRegStateCmd\(\)](#) instead.

**44.3.5.14 static void \_restore\_mmau\_reg\_state ( MMAU\_Type \* *base*, volatile mmau\_reg\_state\_t \* *p* ) [inline], [static]**

This function restores the MMAU operand and control registers from the parameter *p*.

### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>base</i> | Peripheral MMAU base pointer.                           |
| <i>p</i>    | Pointer to the structure to restore the MMAU registers. |

### Note

This is an internal used function, it is recommend to use the function [MMAU\\_HAL\\_RestoreRegStateCmd\(\)](#) instead.

## 44.3.6 MMAU Instruction Result Flags

### 44.3.6.1 Overview

#### Macros

- #define `INS_MMAU_Q` (1U<<0)  
*Accumulation Overflow.*
- #define `INS_MMAU_V` (1U<<1)  
*Multiply or Divide Overflow.*
- #define `INS_MMAU_DZ` (1U<<2)  
*Divide by Zero.*
- #define `INS_MMAU_N` (1U<<3)  
*Signed calculation result is negative.*

### 44.3.6.2 Macro Definition Documentation

44.3.6.2.1 #define `INS_MMAU_Q` (1U<<0)

44.3.6.2.2 #define `INS_MMAU_V` (1U<<1)

44.3.6.2.3 #define `INS_MMAU_DZ` (1U<<2)

44.3.6.2.4 #define `INS_MMAU_N` (1U<<3)

## MMAU Hardware Abstraction Layer

### 44.3.7 MMAU Interrupt Flags

#### 44.3.7.1 Overview

##### Macros

- #define `INT_MMAU_QIF` (1U<<4)  
*Accumulation Overflow Interrupt Flag.*
- #define `INT_MMAU_VIF` (1U<<5)  
*Multiply or Divide Overflow Interrupt Flag.*
- #define `INT_MMAU_DZIF` (1U<<6)  
*Divide by Zero Interrupt Flag.*

#### 44.3.7.2 Macro Definition Documentation

44.3.7.2.1 #define `INT_MMAU_QIF` (1U<<4)

44.3.7.2.2 #define `INT_MMAU_VIF` (1U<<5)

44.3.7.2.3 #define `INT_MMAU_DZIF` (1U<<6)

## 44.3.8 MMAU Interrupt Sources

### 44.3.8.1 Overview

#### Macros

- #define `INT_MMAU_QIE` (1U<<12)  
*Accumulation Overflow Interrupt Enable.*
- #define `INT_MMAU_VIE` (1U<<13)  
*Multiply or Divide Overflow Interrupt Enable.*
- #define `INT_MMAU_DZIE` (1U<<14)  
*Divide by Zero Interrupt Enable.*

### 44.3.8.2 Macro Definition Documentation

44.3.8.2.1 #define `INT_MMAU_QIE` (1U<<12)

44.3.8.2.2 #define `INT_MMAU_VIE` (1U<<13)

44.3.8.2.3 #define `INT_MMAU_DZIE` (1U<<14)

## MMAU peripheral driver

### 44.4 MMAU peripheral driver

#### 44.4.1 Overview

This section describes the programming interface of the MMAU Peripheral driver. The MMAU driver requests, configures, and uses the MMAU hardware.

#### 44.4.2 MMAU Initialization

To initialize the MMAU driver, call the [MMAU\\_DRV\\_Init\(\)](#) function and pass a pointer to the [mmau\\_user\\_config\\_t](#) structure.

#### 44.4.3 MMAU Call diagram

To use the MMAU driver, follow these steps:

1. Initialize the MMAU module: [MMAU\\_DRV\\_init\(\)](#).
2. [OPTION] Register a callback function: [MMAU\\_DRV\\_InstallCallback\(\)](#).
3. Use the mathematical instructions from [mmau\\_ins](#)
4. Deinitialize the MMAU: [MMAU\\_DRV\\_Deinit\(\)](#).

This example shows how to initialize and configure a memory-to-memory transfer:

```
// MMAU callback prototype
void MMAU_EXAMPLE_IrqHandler ();
void MMAU_EXAMPLE_InstallCallback(void (*callbackFunc)(void));

static const frac64_t a[] =
{
 461168601842739000011,
 -758591943731884000011,
 374350119324361000011,
 -87968752029332000011,
 12058566419267000011,
 -1081938910933000011,
 68450698959000011
};

static frac32_t sine (frac32_t x)
{
 if (x > 10737418241) { x = 21474836481-x; }
 else if (x < -10737418241) { x = -21474836481-x; }
 MMAU_HAL_d_mul_dl (a[6],x); // acc= x*a[6]
 MMAU_HAL_d_macd_dl (a[5],x); // acc=acc*x+a[5]
 MMAU_HAL_d_mula_l (x); // acc=acc*x
 MMAU_HAL_d_macd_dl (a[4],x); // acc=acc*x+a[4]
 MMAU_HAL_d_mula_l (x); // acc=acc*x
 MMAU_HAL_d_macd_dl (a[3],x); // acc=acc*x+a[3]
 MMAU_HAL_d_mula_l (x); // acc=acc*x
 MMAU_HAL_d_macd_dl (a[2],x); // acc=acc*x+a[2]
 MMAU_HAL_d_mula_l (x); // acc=acc*x
 MMAU_HAL_d_macd_dl (a[1],x); // acc=acc*x+a[1]
 MMAU_HAL_d_mula_l (x); // acc=acc*x
 MMAU_HAL_d_macd_dl (a[0],x); // acc=acc*x+a[0]
 MMAU_HAL_d_mula_l (x); // acc=acc*x
}
```

```

 return (MMAU_HAL_l_mula_1(1686629713))<<3; // acc=acc*2*pi
}

static volatile frac32_t result;

void main (void)
{
 frac32_t i;

 mmau_user_config_t mmauConfigStr;

 printf("\r\nMMAU driver example : start\n");

## 44.4.4 Function Documentation

### 44.4.4.1 mmau\_status\_t MMAU\_DRV\_Init ( mmau\_user\_config\_t \* userConfigPtr )

This function initializes the MMAU module according to the userConfig structure.

Parameters

|                      |                                          |
|----------------------|------------------------------------------|
| <i>userConfigPtr</i> | Pointer to structure of "mmau_config_t". |
|----------------------|------------------------------------------|

Returns

Execution status.

### 44.4.4.2 mmau\_status\_t MMAU\_DRV\_Deinit ( void )

This function deinitializes the MMAU module.

Returns

Execution status.

#### 44.4.4.3 void MMAU\_DRV\_IRQHandler ( void )

This function is the driver-defined ISR in the MMAU module. It includes the process for interrupt mode defined by the driver. Currently, it is called inside the system-defined ISR.

#### 44.4.5 Variable Documentation

##### 44.4.5.1 const uint32\_t g\_mmauBaseAddr[]

##### 44.4.5.2 const IRQn\_Type g\_mmaulrqld[]

## Chapter 45

# Memory-Mapped Cryptographic Acceleration Unit (MMCAU)

### 45.1 Overview

The ColdFire/ColdFire+ CAU (cryptographic acceleration unit) software library is a set of low-level cryptographic functions implemented using CAU co-processor instructions. The Kinetis mmCAU (memory mapped cryptographic unit) software library uses the mmCAU co-processor that is connected to the Kinetis ARM Cortex-M4 Private Peripheral Bus (PPB). In the the rest of the chapter, CAU refers to both CAU and mmCAU unless explicitly noted. Also, both software libraries share the same application programming interface (API). Both interfaces are referenced as a single definition throughout the chapter unless explicitly noted.

### 45.2 Purpose

The following chapter describes how to use the CAU and mmCAU software library in any application that needs to integrate a cryptographic algorithm or hashing function supported by the software library. Freescale products supported by the software library are ColdFire, ColdFire+, and Kinetis MCU/MPUs. Check the specific Freescale product for CAU and mmCAU availability.

### 45.3 Library Features

The library is as compact and generic as possible to simplify integration with existing cryptographic software. The library has a standard header file with ANSI C prototypes for all functions. This software library is thread safe only if CAU registers are saved on a context switch. The ColdFire/ColdFire+ CAU software library adheres to ColdFire C language compiler conventions (ABI) using standard parameter passing (stack passing). The Kinetis mmCAU software library is also compatible to ARM C compiler conventions (EABI). Only ColdFire and Kinetis devices with the CAU or mmCAU hardware coprocessors are supported. For best performance, input and output data blocks must be aligned on 0modulo4 byte addresses.

The CAU library supports the following encryption/decryption algorithms and hashing functions:

- AES128
- AES192
- AES256
- DES
- 3DES
- MD5
- SHA1
- SHA256

**Note:** 3DES crypto algorithms are supported by calling the corresponding DES crypto function three times. Hardware support for SHA256 is only present in the CAU version 2. See the appropriate MC-

## CAU and mmCAU software library usage

U/MPU reference manual for details about availability. Additionally, the `cau_sha256_initialize_output()` function checks the hardware revision and returns a (1) value if the CAU lacks SHA256 support.

### 45.4 CAU and mmCAU software library overview

Table 1 shows the crypto algorithms and hashing functions included in the software library:

|                          |                            |                              |
|--------------------------|----------------------------|------------------------------|
| <b>Crypto Algorithms</b> | AES128<br>AES192<br>AES256 | cau_aes_set_key              |
|                          |                            | cau_aes_encrypt              |
|                          |                            | cau_aes_decrypt              |
|                          | DES/3DES                   | cau_des_chk_parity           |
|                          |                            | cau_des_encrypt              |
|                          |                            | cau_des_decrypt              |
| <b>Hashing Functions</b> | MD5                        | cau_md5_initialize_output    |
|                          |                            | cau_md5_hash_n               |
|                          |                            | cau_md5_update               |
|                          |                            | cau_md5_hash                 |
|                          | SHA1                       | cau_sha1_initialize_output   |
|                          |                            | cau_sha1_hash_n              |
|                          |                            | cau_sha1_update              |
|                          |                            | cau_sha1_hash                |
|                          | SHA256                     | cau_sha256_initialize_output |
|                          |                            | cau_sha256_hash_n            |
|                          |                            | cau_sha256_update            |
|                          |                            | cau_sha256_hash              |

*Table 1: Library Overview*

### 45.5 CAU and mmCAU software library usage

The software library contains the following files:

| File        | Description                     |
|-------------|---------------------------------|
| cau_api.h   | CAU and mmCAU header file       |
| cau_lib.a   | CAU library: ColdFire/ColdFire+ |
| mmcau_lib.a | mmCAU library: Kinetis          |

*Table 2: File Description*

The header file must always be included in the project. Only the `cau_lib.a` or `mmcau_lib.a` must be included in the project depending on CAU or mmCAU hardware presence.

The header file is shared between the CAU and mmCAU software library, however only one of the following C language macros must be defined for the project to include CAU or mmCAU respectively.

| Macro                        | Description                  |
|------------------------------|------------------------------|
| <code>FREESCALE_CAU</code>   | Using CAU software library   |
| <code>FREESCALE_MMCAU</code> | Using mmCAU software library |

**Table 3: Clanguage Macros Description**

### Example:

```
#define FREESCALE_CAU //CAU functions are implemented in cau_lib.a library
```

When using `FREESCALE_CAU` on ColdFire/ColdFire+ products, standard memory-based parameter passing is assumed. This feature assumes arguments are provided to the library functions using the stack and NOT by using the CPU registers (register parameter passing). This argument passing format is required by Freescale CodeWarrior compiler. If using another compiler, parameter passing must be properly selected for argument stack usage.

### Note:

For CodeWarrior, by adding the compiler directive `__declspec (standard_abi)`, a function is forced to use standard parameter passing:

```
__declspec (standard_abi)
void
cau_aes_set_key (const unsigned char *key, const int key_size, unsigned char*key_sch);
```

## Functions

- void `cau_aes_set_key` (const unsigned char \*key, const int key\_size, unsigned char \*key\_sch)  
*AES: Performs an AES key expansion.*
- void `cau_aes_encrypt` (const unsigned char \*in, const unsigned char \*key\_sch, const int nr, unsigned char \*out)  
*AES: Encrypts a single 16byte block.*
- void `cau_aes_decrypt` (const unsigned char \*in, const unsigned char \*key\_sch, const int nr, unsigned char \*out)  
*AES: Decrypts a single 16byte block.*
- int `cau_des_chk_parity` (const unsigned char \*key)  
*DES: Checks key parity.*
- void `cau_des_encrypt` (const unsigned char \*in, const unsigned char \*key, unsigned char \*out)  
*DES: Encrypts a single 8byte block.*
- void `cau_des_decrypt` (const unsigned char \*in, const unsigned char \*key, unsigned char \*out)  
*DES: Decrypts a single 8byte block.*
- void `cau_md5_initialize_output` (const unsigned char \*md5\_state)  
*MD5: Initializes the MD5 state variables.*

## Function Documentation

- void [cau\\_md5\\_hash\\_n](#) (const unsigned char \*msg\_data, const int num\_blks, unsigned char \*md5\_state)  
*MD5: Updates MD5 state variables.*
- void [cau\\_md5\\_update](#) (const unsigned char \*msg\_data, const int num\_blks, unsigned char \*md5\_state)  
*MD5: Updates MD5 state variables.*
- void [cau\\_md5\\_hash](#) (const unsigned char \*msg\_data, unsigned char \*md5\_state)  
*MD5: Performs MD5 hash algorithm.*
- void [cau\\_sha1\\_initialize\\_output](#) (const unsigned int \*sha1\_state)  
*SHA1: Initializes the SHA1 state variables.*
- void [cau\\_sha1\\_hash\\_n](#) (const unsigned char \*msg\_data, const int num\_blks, unsigned int \*sha1\_state)  
*SHA1: Performs the hash and generate SHA1 state variables.*
- void [cau\\_sha1\\_update](#) (const unsigned char \*msg\_data, const int num\_blks, unsigned int \*sha1\_state)  
*SHA1: Updates SHA1 state variables.*
- void [cau\\_sha1\\_hash](#) (const unsigned char \*msg\_data, unsigned int \*sha1\_state)  
*SHA1: Performs SHA1 hash algorithm.*
- int [cau\\_sha256\\_initialize\\_output](#) (const unsigned int \*output)  
*SHA256: Initializes the hash output and checks the CAU hardware revision.*
- void [cau\\_sha256\\_hash\\_n](#) (const unsigned char \*input, const int num\_blks, unsigned int \*output)  
*SHA256: Updates SHA256 digest output.*
- void [cau\\_sha256\\_update](#) (const unsigned char \*input, const int num\_blks, unsigned int \*output)  
*SHA256: Updates SHA256 state variables.*
- void [cau\\_sha256\\_hash](#) (const unsigned char \*input, unsigned int \*output)  
*SHA256: Performs SHA256 hash algorithm.*

## 45.6 Function Documentation

### 45.6.1 void [cau\\_aes\\_set\\_key](#) ( const unsigned char \* *key*, const int *key\_size*, unsigned char \* *key\_sch* )

This function performs an AES key expansion

Parameters

|     |                 |                                                       |
|-----|-----------------|-------------------------------------------------------|
| in  | <i>*key</i>     | pointer to input key (128, 192, 256 bits in length)   |
| in  | <i>key_size</i> | key_size in bits (128, 192, 256)                      |
| out | <i>*key_sch</i> | pointer to key schedule output (44, 52, 60 longwords) |

Returns

None

Note

Table 4 shows the requirements for the [cau\\_aes\\_set\\_key\(\)](#) function when using AES128, AES192 or AES256.

| [in] Block Size (bits) | [out] Key Schedule Size (32 bit data values) |
|------------------------|----------------------------------------------|
| 128                    | 44                                           |
| 192                    | 52                                           |
| 256                    | 60                                           |

**Table 4: AES set\_key Requirements**

**45.6.2 void cau\_aes\_encrypt ( const unsigned char \* *in*, const unsigned char \* *key\_sch*, const int *nr*, unsigned char \* *out* )**

This function encrypts a single 16-byte block for AES128, AES192 or AES256

Parameters

|     |                 |                                                     |
|-----|-----------------|-----------------------------------------------------|
| in  | <i>*in</i>      | pointer to 16byte block of input plaintext          |
| in  | <i>*key_sch</i> | pointer to key schedule (44, 52, 60 longwords)      |
| in  | <i>nr</i>       | number of AES rounds (10, 12, 14 = f(key_schedule)) |
| out | <i>*out</i>     | pointer to 16byte block of output ciphertext        |

Returns

None

Note

Input and output blocks may overlap.

Table 5 shows the requirements for the [cau\\_aes\\_encrypt\(\)/cau\\_aes\\_decrypt\(\)](#) function when using AES128, AES192 or AES256.

| Block Cipher | [in] Key Schedule Size (longwords) | [in] Number of AES rounds |
|--------------|------------------------------------|---------------------------|
| AES128       | 44                                 | 10                        |
| AES192       | 52                                 | 12                        |
| AES256       | 60                                 | 14                        |

**Table 5: AES Encryption Requirements**

---

## Function Documentation

**45.6.3 void cau\_aes\_decrypt ( const unsigned char \* *in*, const unsigned char \* *key\_sch*, const int *nr*, unsigned char \* *out* )**

This function decrypts a single 16byte block for AES128, AES192 and AES256

Parameters

|     |                 |                                                     |
|-----|-----------------|-----------------------------------------------------|
| in  | <i>*in</i>      | pointer to 16byte block of input ciphertext         |
| in  | <i>*key_sch</i> | pointer to key schedule (44, 52, 60 longwords)      |
| in  | <i>nr</i>       | number of AES rounds (10, 12, 14 = f(key_schedule)) |
| out | <i>*out</i>     | pointer to 16byte block of output plaintext         |

Returns

None

Note

Input and output blocks may overlap.

Table 6 shows the requirements for the [cau\\_aes\\_encrypt\(\)/cau\\_aes\\_decrypt\(\)](#) function when using AES128, AES192 or AES256.

| Block Cipher | [in] Key Schedule Size (longwords) | [in] Number of AES rounds |
|--------------|------------------------------------|---------------------------|
| AES128       | 44                                 | 10                        |
| AES192       | 52                                 | 12                        |
| AES256       | 60                                 | 14                        |

**Table 6: AES Decryption Requirements**

**45.6.4 int cau\_des\_chk\_parity ( const unsigned char \* key )**

This function checks the parity of a key

Parameters

|    |             |                                           |
|----|-------------|-------------------------------------------|
| in | <i>*key</i> | pointer to 64bit DES key with parity bits |
|----|-------------|-------------------------------------------|

Returns

- 0 no error
- 1 parity error

**45.6.5 void cau\_des\_encrypt ( const unsigned char \* in, const unsigned char \* key, unsigned char \* out )**

This function encrypt a single 8-byte block

## Function Documentation

### Parameters

|     |             |                                             |
|-----|-------------|---------------------------------------------|
| in  | <i>*in</i>  | pointer to 8byte block of input plaintext   |
| in  | <i>*key</i> | pointer to 64bit DES key with parity bits   |
| out | <i>*out</i> | pointer to 8byte block of output ciphertext |

### Returns

None

### Note

Input and output blocks may overlap.

### 45.6.6 void cau\_des\_decrypt ( const unsigned char \* *in*, const unsigned char \* *key*, unsigned char \* *out* )

This function decrypt a single 8-byte block

### Parameters

|     |             |                                            |
|-----|-------------|--------------------------------------------|
| in  | <i>*in</i>  | pointer to 8byte block of input ciphertext |
| in  | <i>*key</i> | pointer to 64bit DES key with parity bits  |
| out | <i>*out</i> | pointer to 8byte block of output plaintext |

### Returns

None

### Note

Input and output blocks may overlap.

### 45.6.7 void cau\_md5\_initialize\_output ( const unsigned char \* *md5\_state* )

This function initializes the MD5 state variables

Parameters

|     |                   |                                                         |
|-----|-------------------|---------------------------------------------------------|
| out | <i>*md5_state</i> | pointer to 120bit block of md5 state variables: a,b,c,d |
|-----|-------------------|---------------------------------------------------------|

Returns

None

**45.6.8 void cau\_md5\_hash\_n ( const unsigned char \* *msg\_data*, const int *num\_blks*, unsigned char \* *md5\_state* )**

This function updates MD5 state variables for one or more input message blocks

Parameters

|         |                   |                                                         |
|---------|-------------------|---------------------------------------------------------|
| in      | <i>*msg_data</i>  | pointer to start of input message data                  |
| in      | <i>num_blks</i>   | number of 512bit blocks to process                      |
| in, out | <i>*md5_state</i> | pointer to 128bit block of MD5 state variables: a,b,c,d |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_md5\\_initialize\\_output\(\)](#) function must be called first. Useful when handling noncontiguous input message blocks.

**45.6.9 void cau\_md5\_update ( const unsigned char \* *msg\_data*, const int *num\_blks*, unsigned char \* *md5\_state* )**

This function updates MD5 state variables for one or more input message blocks

Parameters

---

## Function Documentation

|         |                   |                                                         |
|---------|-------------------|---------------------------------------------------------|
| in      | <i>*msg_data</i>  | pointer to start of input message data                  |
| in      | <i>num_blks</i>   | number of 512bit blocks to process                      |
| in, out | <i>*md5_state</i> | pointer to 128bit block of MD5 state variables: a,b,c,d |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_md5\\_initialize\\_output\(\)](#) function is not required. All input message blocks must be contiguous.

### 45.6.10 void cau\_md5\_hash ( const unsigned char \* *msg\_data*, unsigned char \* *md5\_state* )

This function performs MD5 hash algorithm for a single input message block

Parameters

|         |                   |                                                         |
|---------|-------------------|---------------------------------------------------------|
| in      | <i>*msg_data</i>  | pointer to start of input message data                  |
| in, out | <i>*md5_state</i> | pointer to 128bit block of MD5 state variables: a,b,c,d |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_md5\\_initialize\\_output\(\)](#) function must be called first. Only works for a single input message block.

### 45.6.11 void cau\_sha1\_initialize\_output ( const unsigned int \* *sha1\_state* )

This function initializes the SHA1 state variables

Parameters

|     |                    |                                                            |
|-----|--------------------|------------------------------------------------------------|
| out | <i>*sha1_state</i> | pointer to 160bit block of SHA1 state variables: a,b,c,d,e |
|-----|--------------------|------------------------------------------------------------|

Returns

None

**45.6.12 void cau\_sha1\_hash\_n ( const unsigned char \* *msg\_data*, const int *num\_blks*, unsigned int \* *sha1\_state* )**

This function performs the hash and generate SHA1 state variables for one or more input message blocks

Parameters

|         |                    |                                                            |
|---------|--------------------|------------------------------------------------------------|
| in      | <i>*msg_data</i>   | pointer to start of input message data                     |
| in      | <i>num_blks</i>    | number of 512bit blocks to process                         |
| in, out | <i>*sha1_state</i> | pointer to 160bit block of SHA1 state variables: a,b,c,d,e |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_sha1\\_initialize\\_output\(\)](#) function must be called first. Useful when handling noncontiguous input message blocks.

**45.6.13 void cau\_sha1\_update ( const unsigned char \* *msg\_data*, const int *num\_blks*, unsigned int \* *sha1\_state* )**

This function updates SHA1 state variables for one or more input message blocks arguments

Parameters

---

## Function Documentation

|     |                    |                                                            |
|-----|--------------------|------------------------------------------------------------|
| in  | <i>*msg_data</i>   | pointer to start of input message data                     |
| in  | <i>num_blks</i>    | number of 512bit blocks to process                         |
| out | <i>*sha1_state</i> | pointer to 160bit block of SHA1 state variables: a,b,c,d,e |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_sha1\\_initialize\\_output\(\)](#) function is not required. All input message blocks must be contiguous.

### 45.6.14 void cau\_sha1\_hash ( const unsigned char \* *msg\_data*, unsigned int \* *sha1\_state* )

This function performs SHA1 hash algorithm on a single input message block

Parameters

|         |                    |                                                            |
|---------|--------------------|------------------------------------------------------------|
| in      | <i>*msg_data</i>   | pointer to start of input message data                     |
| in, out | <i>*sha1_state</i> | pointer to 160bit block of SHA1 state variables: a,b,c,d,e |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_sha1\\_initialize\\_output\(\)](#) function must be called first. Only works for a single input message block.

### 45.6.15 int cau\_sha256\_initialize\_output ( const unsigned int \* *output* )

This function initializes the hash output and checks the CAU hardware revision

Parameters

|     |                |                                         |
|-----|----------------|-----------------------------------------|
| out | <i>*output</i> | pointer to 256bit message digest output |
|-----|----------------|-----------------------------------------|

Returns

- 0 No error. CAU2 hardware present. SHA256 HW support available
- 1 Error. CAU2 hardware not present. No SHA256 HW support available

**45.6.16 void cau\_sha256\_hash\_n ( const unsigned char \* *input*, const int *num\_blks*, unsigned int \* *output* )**

This function updates SHA256 digest output for one or more message block arguments

Parameters

|         |                 |                                         |
|---------|-----------------|-----------------------------------------|
| in      | <i>*input</i>   | pointer to start of input message       |
| in      | <i>num_blks</i> | number of 512bit blocks to process      |
| in, out | <i>*output</i>  | pointer to 256bit message digest output |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_sha256\\_initialize\\_output\(\)](#) function must be called first. Useful when handling noncontiguous input message blocks.

**45.6.17 void cau\_sha256\_update ( const unsigned char \* *input*, const int *num\_blks*, unsigned int \* *output* )**

This function updates SHA256 state variables for one or more input message blocks arguments

Parameters

## Function Documentation

|     |                 |                                         |
|-----|-----------------|-----------------------------------------|
| in  | <i>*input</i>   | pointer to start of input message data  |
| in  | <i>num_blks</i> | number of 512bit blocks to process      |
| out | <i>*output</i>  | pointer to 256bit message digest output |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_sha256\\_initialize\\_output\(\)](#) function is not required. All input message blocks must be contiguous.

### 45.6.18 void cau\_sha256\_hash ( const unsigned char \* *input*, unsigned int \* *output* )

This function performs SHA256 hash algorithm for a single input message block

Parameters

|         |                |                                         |
|---------|----------------|-----------------------------------------|
| in      | <i>*input</i>  | pointer to start of input message data  |
| in, out | <i>*output</i> | pointer to 256bit message digest output |

Returns

None

Note

Input message and digest output blocks must not overlap. The [cau\\_sha256\\_initialize\\_output\(\)](#) function must be called first. Only works for a single input message block.

---

## Chapter 46

# Memory-Mapped Divide and Square Root(MMDVSQ)

### 46.1 Overview

The Kinetis SDK provides the HAL drivers for the Memory-Mapped Divide and Square Root (MMDVSQ) block of Kinetis devices.

### Modules

- [MMDVSQ HAL driver](#)

## MMDVSQ HAL driver

### 46.2 MMDVSQ HAL driver

#### 46.2.1 Overview

The section describes the programming interface of the MMDVSQ HAL driver. The memory-mapped divide and square root (MMDVSQ) module provides hardware division and square root operation for the MCU. The MMDVSQ HAL provides a set of APIs to access these registers.

#### 46.2.2 Perform MMDVSQ Divide or square root operation

The MMDVSQ HAL provides a set of API functions to set up mathematical computations for division and square root. Ensure that the mode setting registers are configured properly. Otherwise, the API functions are provided with an invalid value.

This is an example to access MMDVSQ HAL APIs:

```
#include "fsl_mmdvsq_hal.h"
// set divide normal start //
MMDVSQ_HAL_SetDivideFastStart(MMDVSQ_BASE, 1)
// perform square root operation of 2 //
result = MMDVSQ_HAL_Sqrt(MMDVSQ_BASE, 2);
```

#### Files

- file [fsl\\_mmdvsq\\_hal.h](#)

#### Enumerations

- enum [mmdvsq\\_execution\\_status\\_t](#)  
*MMDVSQ execution status.*
- enum [mmdvsq\\_divide\\_operation\\_select\\_t](#)

*set the current MMDVSQ radicand value*

## MMDVSQ HAL driver

### 46.2.3 Function Documentation

#### 46.2.3.1 `uint32_t MMDVSQ_HAL_DivUR ( MMDVSQ_Type * base, uint32_t dividend, uint32_t divisor )`

This function performs the MMDVSQ unsigned divide operation and get remainder. It is in block mode. For non-block mode, other HAL routines can be used.

## Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address for current MMDVSQ instance. |
| <i>dividend</i> | -Dividend value                           |
| <i>divisor</i>  | -Divisor value                            |

## Returns

Unsigned divide calculation result in the MMDVSQ\_RES register.

**46.2.3.2 uint32\_t MMDVSQ\_HAL\_DivUQ ( MMDVSQ\_Type \* *base*, uint32\_t *dividend*, uint32\_t *divisor* )**

This function performs the MMDVSQ unsigned divide operation and get quotient. It is in block mode. For non-block mode, other HAL routines can be used.

## Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address for current MMDVSQ instance. |
| <i>dividend</i> | -Dividend value                           |
| <i>divisor</i>  | -Divisor value                            |

## Returns

Unsigned divide calculation result in the MMDVSQ\_RES register.

**46.2.3.3 uint32\_t MMDVSQ\_HAL\_DivSR ( MMDVSQ\_Type \* *base*, uint32\_t *dividend*, uint32\_t *divisor* )**

This function performs the MMDVSQ signed divide operation and get remainder. It is in block mode. For non-block mode, other HAL routines can be used.

## Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address for current MMDVSQ instance. |
| <i>dividend</i> | -Dividend value                           |

## MMDVSQ HAL driver

|                |                |
|----------------|----------------|
| <i>divisor</i> | -Divisor value |
|----------------|----------------|

Returns

Signed divide calculation result in the MMDVSQ\_RES register.

### 46.2.3.4 `uint32_t MMDVSQ_HAL_DivSQ ( MMDVSQ_Type * base, uint32_t dividend, uint32_t divisor )`

This function performs the MMDVSQ signed divide operation and get quotient. It is in block mode. For non-block mode, other HAL routines can be used.

Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address for current MMDVSQ instance. |
| <i>dividend</i> | -Dividend value                           |
| <i>divisor</i>  | -Divisor value                            |

Returns

Signed divide calculation result in the MMDVSQ\_RES register.

### 46.2.3.5 `uint16_t MMDVSQ_HAL_Sqrt ( MMDVSQ_Type * base, uint32_t radicand )`

This function performs the MMDVSQ square root operation and return the sqrt result of given radicand-value. It is in block mode. For non-block mode, other HAL routines can be used.

Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address for current MMDVSQ instance. |
| <i>radicand</i> | - Radicand value                          |

Returns

Square root calculation result in the MMDVSQ\_RES register.

### 46.2.3.6 `static mmdvsq_execution_status_t MMDVSQ_HAL_GetExecutionStatus ( MMDVSQ_Type * base ) [inline], [static]`

This function checks the current MMDVSQ execution status

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

Current MMDVSQ execution status

**46.2.3.7 static bool MMDVSQ\_HAL\_GetBusyStatus ( MMDVSQ\_Type \* *base* )  
[inline], [static]**

This function checks the current MMDVSQ BUSY status

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

MMDVSQ is busy or idle

**46.2.3.8 static void MMDVSQ\_HAL\_SetDivideFastStart ( MMDVSQ\_Type \* *base*, bool  
*enable* ) [inline], [static]**

This function sets the MMDVSQ divide fast start.

Parameters

|               |                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MMDVSQ instance.                                                                                                                                                    |
| <i>enable</i> | Enable or disable divide fast start mode. <ul style="list-style-type: none"> <li>• true: enable divide fast start.</li> <li>• false: disable divide fast start, use normal start.</li> </ul> |

## MMDVSQ HAL driver

### 46.2.3.9 static bool MMDVSQ\_HAL\_GetDivideFastStart ( MMDVSQ\_Type \* *base* ) [inline], [static]

This function gets the MMDVSQ divide fast start setting

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

MMDVSQ divide start is fast start or normal start -true : enable fast start mode. -false : disable fast start, divide works normal start mode.

### 46.2.3.10 static void MMDVSQ\_HAL\_SetDivdeByZero ( MMDVSQ\_Type \* *base*, bool *enable* ) [inline], [static]

This function sets the MMDVSQ divide by zero detection

Parameters

|               |                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MMDVSQ instance.                                                                                                                                         |
| <i>enable</i> | Enable or disable divide by zero detect. <ul style="list-style-type: none"> <li>• true: Enable divide by zero detect.</li> <li>• false: Disable divide by zero detect.</li> </ul> |

### 46.2.3.11 static bool MMDVSQ\_HAL\_GetDivdeByZeroSetting ( MMDVSQ\_Type \* *base* ) [inline], [static]

This function gets the MMDVSQ divide by zero setting

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

MMDVSQ divide is non-zero divisor or zero divisor

- true: Enable divide by zero detect.
  - false: Disable divide by zero detect.

**46.2.3.12 static bool MMDVSQ\_HAL\_GetDivdeByZeroStatus ( MMDVSQ\_Type \* *base* ) [inline], [static]**

This function gets the MMDVSQ divide by zero status

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

MMDVSQ divide is non-zero divisor or zero divisor

- true: zero divisor.
  - false: non-zero divisor.

**46.2.3.13 static void MMDVSQ\_HAL\_SetRemainderCalculation ( MMDVSQ\_Type \* *base*, bool *enable* ) [inline], [static]**

This function sets the MMDVSQ divide remainder calculation

Parameters

|               |                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MMDVSQ instance.                                                                                                                                                           |
| <i>enable</i> | Return quotient or remainder in the MMDVSQ_RES register. <ul style="list-style-type: none"> <li>• true: Return remainder in MMQVSQ_RES.</li> <li>• false: Return quotient in MMQVSQ_RES.</li> </ul> |

## MMDVSQ HAL driver

### 46.2.3.14 static bool MMDVSQ\_HAL\_GetRemainderCalculation ( MMDVSQ\_Type \* *base* ) [inline], [static]

This function gets the MMDVSQ divide remainder calculation

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

MMDVSQ divide remainder calculation is quotient or remainder

- true: return remainder in RES register.
- false: return quotient in RES register.

### 46.2.3.15 static void MMDVSQ\_HAL\_SetUnsignedCalculation ( MMDVSQ\_Type \* *base*, bool *enable* ) [inline], [static]

This function sets the MMDVSQ unsigned divide calculation

Parameters

|               |                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current MMDVSQ instance.                                                                                                                                                           |
| <i>enable</i> | Enable or disable unsigned divide calculation. <ul style="list-style-type: none"> <li>• true: Enable unsigned divide calculation.</li> <li>• false: Disable unsigned divide calculation.</li> </ul> |

### 46.2.3.16 static bool MMDVSQ\_HAL\_GetUnsignedCalculation ( MMDVSQ\_Type \* *base* ) [inline], [static]

This function gets the MMDVSQ unsigned divide calculation

Parameters

---

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

MMDVSQ divide is unsigned divide operation

- true: perform an unsigned divide.
- false: perform a signed divide

**46.2.3.17 static uint32\_t MMDVSQ\_HAL\_GetResult ( MMDVSQ\_Type \* *base* )  
[inline], [static]**

This function gets the MMDVSQ operation result

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

Returns

MMDVSQ operation result

**46.2.3.18 static void MMDVSQ\_HAL\_SetDividend ( MMDVSQ\_Type \* *base*, uint32\_t  
*dividend* ) [inline], [static]**

This function sets the MMDVSQ dividend value

Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address for current MMDVSQ instance. |
| <i>dividend</i> | Dividend value for divide calculations.   |

**46.2.3.19 static uint32\_t MMDVSQ\_HAL\_GetDividend ( MMDVSQ\_Type \* *base* )  
[inline], [static]**

This function gets the MMDVSQ dividend value

## MMDVSQ HAL driver

### Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

### Returns

MMDVSQ dividend value

**46.2.3.20** `static void MMDVSQ_HAL_SetDivisor ( MMDVSQ_Type * base, uint32_t divisor ) [inline], [static]`

This function sets the MMDVSQ divisor value

### Parameters

|                |                                           |
|----------------|-------------------------------------------|
| <i>base</i>    | Base address for current MMDVSQ instance. |
| <i>divisor</i> | Divisor value for divide calculations..   |

**46.2.3.21** `static uint32_t MMDVSQ_HAL_GetDivisor ( MMDVSQ_Type * base ) [inline], [static]`

This function gets the MMDVSQ divisor value

### Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address for current MMDVSQ instance. |
|-------------|-------------------------------------------|

### Returns

MMDVSQ divisor value

**46.2.3.22** `static void MMDVSQ_HAL_SetRadicand ( MMDVSQ_Type * base, uint32_t radicand ) [inline], [static]`

This function sets the MMDVSQ radicand value

### Parameters

---

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address for current MMDVSQ instance. |
| <i>radicand</i> | Radicand value of Sqrt.                   |

---

## Chapter 47

# Memory Protection Unit (MPU)

### 47.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Memory Protection Unit (MPU) block of Kinetis devices.

### Modules

- [MPU HAL driver](#)
- [MPU Peripheral driver](#)

## MPU HAL driver

### 47.2 MPU HAL driver

#### 47.2.1 Overview

This section describes the programming interface of the MPU HAL driver.

#### Data Structures

- struct [mpu\\_hardware\\_info\\_t](#)  
*MPU hardware basic information. [More...](#)*
- struct [mpu\\_access\\_err\\_info\\_t](#)  
*Describes MPU detail error access info. [More...](#)*
- struct [mpu\\_low\\_masters\\_access\\_rights\\_t](#)  
*MPU access rights for low master0~master3. [More...](#)*
- struct [mpu\\_high\\_masters\\_access\\_rights\\_t](#)  
*MPU access rights mode for high master4~master7. [More...](#)*
- struct [mpu\\_region\\_config\\_t](#)  
*Data v for MPU region initialize. [More...](#)*

#### Enumerations

- enum [mpu\\_region\\_num\\_t](#)  
*MPU region number region0~region11.*
- enum [mpu\\_region\\_total\\_num\\_t](#) {  
[kMPU8Regions](#) = 0x0U,  
[kMPU12Regions](#) = 0x1U,  
[kMPU16Regions](#) = 0x2U }  
*Describes the number of MPU regions.*
- enum [mpu\\_err\\_access\\_type\\_t](#) {  
[kMPUErrTypeRead](#) = 0U,  
[kMPUErrTypeWrite](#) = 1U }  
*MPU access error.*
- enum [mpu\\_err\\_attributes\\_t](#) {  
[kMPUInstructionAccessInUserMode](#) = 0U,  
[kMPUDataAccessInUserMode](#) = 1U,  
[kMPUInstructionAccessInSupervisorMode](#) = 2U,  
[kMPUDataAccessInSupervisorMode](#) = 3U }  
*MPU access error attributes.*
- enum [mpu\\_access\\_mode\\_t](#) {  
[kMPUAccessInUserMode](#) = 0U,  
[kMPUAccessInSupervisorMode](#) = 1U }  
*access MPU in which mode.*
- enum [mpu\\_master\\_t](#) {

- ```

kMPUMaster0 = 0U,
kMPUMaster1 = 1U,
kMPUMaster2 = 2U,
kMPUMaster3 = 3U,
kMPUMaster4 = 4U,
kMPUMaster5 = 5U,
kMPUMaster6 = 6U }
    MPU master number.
• enum mpu_err_access_ctr_t {
    kMPUNoRegionHit = 0U,
    kMPUNoneOverlappRegion = 1U,
    kMPUOverlappRegion = 2U }
    MPU error access control detail.
• enum mpu_supervisor_access_rights_t {
    kMPUSupervisorReadWriteExecute = 0U,
    kMPUSupervisorReadExecute = 1U,
    kMPUSupervisorReadWrite = 2U,
    kMPUSupervisorEqualToUsermode = 3U }
    MPU access rights in supervisor mode for master0~master3.
• enum mpu_user_access_rights_t {
    kMPUUserNoAccessRights = 0U,
    kMPUUserExecute = 1U,
    kMPUUserWrite = 2U,
    kMPUUserWriteExecute = 3U,
    kMPUUserRead = 4U,
    kMPUUserReadExecute = 5U,
    kMPUUserReadWrite = 6U,
    kMPUUserReadWriteExecute = 7U }
    MPU access rights in user mode for master0~master3.
• enum mpu_status_t {
    kStatus_MPU_Success = 0x0U,
    kStatus_MPU_Fail = 0x1U,
    kStatus_MPU_NotInitialized = 0x2U,
    kStatus_MPU_NullArgument = 0x3U }
    MPU status return codes.

```

MPU HAL.

- static void **MPU_HAL_Enable** (MPU_Type *base)
Enables the MPU module operation.
- static void **MPU_HAL_Disable** (MPU_Type *base)
Disables the MPU module operation.
- static bool **MPU_HAL_IsEnable** (MPU_Type *base)
Checks whether the MPU module is enabled.
- void **MPU_HAL_GetHardwareInfo** (MPU_Type *base, mpu_hardware_info_t *infoPtr)
Gets MPU basic hardware info.

MPU HAL driver

- void [MPU_HAL_GetDetailErrorAccessInfo](#) (MPU_Type *base, [mpu_access_err_info_t](#) *errInfoArrayPtr)
Gets MPU derail error access info.
- void [MPU_HAL_SetRegionAddr](#) (MPU_Type *base, [mpu_region_num_t](#) regionNum, uint32_t startAddr, uint32_t endAddr)
Sets region start and end address.
- void [MPU_HAL_SetLowMasterAccessRights](#) (MPU_Type *base, [mpu_region_num_t](#) regionNum, [mpu_master_t](#) masterNum, const [mpu_low_masters_access_rights_t](#) *accessRightsPtr)
Configures low master0~3 access permission for a specific region.
- void [MPU_HAL_SetHighMasterAccessRights](#) (MPU_Type *base, [mpu_region_num_t](#) regionNum, [mpu_master_t](#) masterNum, const [mpu_high_masters_access_rights_t](#) *accessRightsPtr)
Sets high master access permission for a specific region.
- static void [MPU_HAL_SetRegionValidCmd](#) (MPU_Type *base, [mpu_region_num_t](#) regionNum, bool enable)
Sets the region valid value.
- void [MPU_HAL_SetLowMasterAccessRightsByAlternateReg](#) (MPU_Type *base, [mpu_region_num_t](#) regionNum, [mpu_master_t](#) masterNum, const [mpu_low_masters_access_rights_t](#) *accessRightsPtr)
Configures low master0~3 access permission for a specific region.
- void [MPU_HAL_SetHighMasterAccessRightsByAlternateReg](#) (MPU_Type *base, [mpu_region_num_t](#) regionNum, [mpu_master_t](#) masterNum, const [mpu_high_masters_access_rights_t](#) *accessRightsPtr)
Sets high master access permission for a specific region.
- void [MPU_HAL_SetRegionConfig](#) (MPU_Type *base, const [mpu_region_config_t](#) *regionConfigPtr)
Configures the MPU region.
- void [MPU_HAL_Init](#) (MPU_Type *base)
Initializes the MPU module.

47.2.2 Data Structure Documentation

47.2.2.1 struct [mpu_hardware_info_t](#)

Data Fields

- [uint8_t kMPUHardwareRevisionLevel](#)
Specifies the MPU's hardware and definition reversion level.
- [uint8_t kMPUSupportSlavePortsNum](#)
Specifies the number of slave ports connected to MPU.
- [mpu_region_total_num_t kMPUSupportRegionsNum](#)
Indicates the number of region descriptors implemented.

47.2.2.2 struct [mpu_access_err_info_t](#)

Data Fields

- [mpu_master_t](#) master

- *Access error master.*
- [mpu_err_attributes_t](#) `attributes`
Access error attributes.
- [mpu_err_access_type_t](#) `accessType`
Access error type.
- [mpu_err_access_ctr_t](#) `accessCtr`
Access error control.
- [uint32_t](#) `addr`
Access error address.
- [uint8_t](#) `slavePort`
Access error slave port.

47.2.2.3 struct `mpu_low_masters_access_rights_t`

Data Fields

- [mpu_supervisor_access_rights_t](#) `superAccessRights`
master access rights in supervisor mode
- [mpu_user_access_rights_t](#) `userAccessRights`
master access rights in user mode

47.2.2.4 struct `mpu_high_masters_access_rights_t`

Data Fields

- [bool](#) `kMPUWriteEnable`
Enables or disables write permission.
- [bool](#) `kMPUReadEnable`
Enables or disables read permission.

47.2.2.5 struct `mpu_region_config_t`

This structure is used when calling the `MPU_DRV_Init` function.

Data Fields

- [mpu_region_num_t](#) `regionNum`
MPU region number.
- [uint32_t](#) `startAddr`
Memory region start address.
- [uint32_t](#) `endAddr`
Memory region end address.
- [mpu_low_masters_access_rights_t](#) `accessRights1` [4]
Low masters access permission.
- [mpu_high_masters_access_rights_t](#) `accessRights2` [4]
Low masters access permission.
- [bool](#) `regionEnable`

MPU HAL driver

Enables or disables region.

47.2.3 Enumeration Type Documentation

47.2.3.1 enum mpu_region_num_t

47.2.3.2 enum mpu_region_total_num_t

Enumerator

kMPU8Regions MPU supports 8 regions.

kMPU12Regions MPU supports 12 regions.

kMPU16Regions MPU supports 16 regions.

47.2.3.3 enum mpu_err_access_type_t

Enumerator

kMPUErrTypeRead MPU error type—read.

kMPUErrTypeWrite MPU error type—write.

47.2.3.4 enum mpu_err_attributes_t

Enumerator

kMPUInstructionAccessInUserMode access instruction error in user mode

kMPUDataAccessInUserMode access data error in user mode

kMPUInstructionAccessInSupervisorMode access instruction error in supervisor mode

kMPUDataAccessInSupervisorMode access data error in supervisor mode

47.2.3.5 enum mpu_access_mode_t

Enumerator

kMPUAccessInUserMode access data or instruction in user mode

kMPUAccessInSupervisorMode access data or instruction in supervisor mode

47.2.3.6 enum mpu_master_t

Enumerator

kMPUMaster0 MPU master core.

kMPUMaster1 MPU master defined in SOC.
kMPUMaster2 MPU master defined in SOC.
kMPUMaster3 MPU master defined in SOC.
kMPUMaster4 MPU master defined in SOC.
kMPUMaster5 MPU master defined in SOC.
kMPUMaster6 MPU master defined in SOC.

47.2.3.7 enum mpu_err_access_ctr_t

Enumerator

kMPUNoRegionHit no region hit error
kMPUNoneOverlappRegion access single region error
kMPUOverlappRegion access overlapping region error

47.2.3.8 enum mpu_supervisor_access_rights_t

Enumerator

kMPUSupervisorReadWriteExecute Read write and execute operations are allowed in supervisor mode.
kMPUSupervisorReadExecute Read and execute operations are allowed in supervisor mode.
kMPUSupervisorReadWrite Read write operations are allowed in supervisor mode.
kMPUSupervisorEqualToUsermode Access permission equal to user mode.

47.2.3.9 enum mpu_user_access_rights_t

Enumerator

kMPUUserNoAccessRights no access allowed in user mode
kMPUUserExecute execute operation is allowed in user mode
kMPUUserWrite Write operation is allowed in user mode.
kMPUUserWriteExecute Write and execute operations are allowed in user mode.
kMPUUserRead Read is allowed in user mode.
kMPUUserReadExecute Read and execute operations are allowed in user mode.
kMPUUserReadWrite Read and write operations are allowed in user mode.
kMPUUserReadWriteExecute Read write and execute operations are allowed in user mode.

47.2.3.10 enum mpu_status_t

Enumerator

kStatus_MPU_Success MPU Succeed.

MPU HAL driver

kStatus_MPU_Fail MPU failed.

kStatus_MPU_NotInitialized MPU is not initialized yet.

kStatus_MPU_NullArgument Argument is NULL.

47.2.4 Function Documentation

47.2.4.1 static void MPU_HAL_Enable (MPU_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address of MPU peripheral instance. |
|-------------|--|

47.2.4.2 static void MPU_HAL_Disable (MPU_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address of MPU peripheral instance. |
|-------------|--|

47.2.4.3 static bool MPU_HAL_IsEnable (MPU_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address of MPU peripheral instance. |
|-------------|--|

Returns

State of the module

Return values

| | |
|--------------|-------------------------|
| <i>true</i> | MPU module is enabled. |
| <i>false</i> | MPU module is disabled. |

47.2.4.4 void MPU_HAL_GetHardwareInfo (MPU_Type * *base*, mpu_hardware_info_t * *infoPtr*)

Parameters

| | |
|----------------|---|
| <i>base</i> | Base address of MPU peripheral instance. |
| <i>infoPtr</i> | The pointer to the hardware information structure see mpu_hardware_info_t . |

47.2.4.5 void MPU_HAL_GetDetailErrorAccessInfo (MPU_Type * *base*, mpu_access_err_info_t * *errInfoArrayPtr*)

Parameters

| | |
|------------------------|---|
| <i>base</i> | Base address of MPU peripheral instance. |
| <i>errInfoArrayPtr</i> | The pointer to array of structure mpu_access_err_info_t . |

47.2.4.6 void MPU_HAL_SetRegionAddr (MPU_Type * *base*, mpu_region_num_t *regionNum*, uint32_t *startAddr*, uint32_t *endAddr*)

Parameters

| | |
|------------------|---|
| <i>base</i> | Base address of MPU peripheral instance.. |
| <i>regionNum</i> | MPU region number. |
| <i>startAddr</i> | Region start address. |
| <i>endAddr</i> | Region end address. |

47.2.4.7 void MPU_HAL_SetLowMasterAccessRights (MPU_Type * *base*, mpu_region_num_t *regionNum*, mpu_master_t *masterNum*, const mpu_low_masters_access_rights_t * *accessRightsPtr*)

Parameters

| | |
|------------------|--|
| <i>base</i> | Base address of MPU peripheral instance. |
| <i>regionNum</i> | MPU region number. |

MPU HAL driver

| | |
|------------------------|---|
| <i>masterNum</i> | MPU master number. |
| <i>accessRightsPtr</i> | The pointer of master access rights see mpu_low_masters_access_rights_t . |

47.2.4.8 void MPU_HAL_SetHighMasterAccessRights (MPU_Type * *base*, mpu_region_num_t *regionNum*, mpu_master_t *masterNum*, const mpu_high_masters_access_rights_t * *accessRightsPtr*)

Parameters

| | |
|------------------------|---|
| <i>base</i> | Base address of MPU peripheral instance. |
| <i>regionNum</i> | MPU region number. |
| <i>masterNum</i> | MPU master number. |
| <i>accessRightsPtr</i> | The pointer of master access rights see mpu_low_masters_access_rights_t . |

47.2.4.9 static void MPU_HAL_SetRegionValidCmd (MPU_Type * *base*, mpu_region_num_t *regionNum*, bool *enable*) [inline], [static]

When a region changed not by alternating registers should set the valid again.

Parameters

| | |
|------------------|--|
| <i>base</i> | Base address of MPU peripheral instance. |
| <i>regionNum</i> | MPU region number. |
| <i>enable</i> | Enables or disables region. |

47.2.4.10 void MPU_HAL_SetLowMasterAccessRightsByAlternateReg (MPU_Type * *base*, mpu_region_num_t *regionNum*, mpu_master_t *masterNum*, const mpu_low_masters_access_rights_t * *accessRightsPtr*)

Parameters

| | |
|-------------------------|---|
| <i>base</i> | Base address of MPU peripheral instance. |
| <i>regionNum</i> | MPU region number. |
| <i>masterNum</i> | MPU master number. |
| <i>accessRights-Ptr</i> | The pointer of master access rights see mpu_low_masters_access_rights_t . |

47.2.4.11 void MPU_HAL_SetHighMasterAccessRightsByAlternateReg (MPU_Type * *base*, mpu_region_num_t *regionNum*, mpu_master_t *masterNum*, const mpu_high_masters_access_rights_t * *accessRightsPtr*)

Parameters

| | |
|-------------------------|---|
| <i>base</i> | Base address of MPU peripheral instance. |
| <i>regionNum</i> | MPU region number. |
| <i>masterNum</i> | MPU master number. |
| <i>accessRights-Ptr</i> | The pointer of master access rights see mpu_low_masters_access_rights_t . |

47.2.4.12 void MPU_HAL_SetRegionConfig (MPU_Type * *base*, const mpu_region_config_t * *regionConfigPtr*)

Parameters

| | |
|-------------------------|--|
| <i>base</i> | The MPU peripheral base address. |
| <i>regionConfig-Ptr</i> | The pointer to the MPU user configure structure, see mpu_region_config_t . |

47.2.4.13 void MPU_HAL_Init (MPU_Type * *base*)

Parameters

| | |
|-------------|----------------------------------|
| <i>base</i> | The MPU peripheral base address. |
|-------------|----------------------------------|

47.3 MPU Peripheral driver

47.3.1 Overview

This section describes the programming interface of the MPU Peripheral driver. The MPU driver configures MPU.

47.3.2 MPU Initialization

To initialize the MPU module, call the `MPU_DRV_Init()` function and provide the user configuration data structure. This function sets the configuration of the MPU module automatically and enables the MPU module.

Note that the configuration start address, end address, the region valid value and the debugger's access permission for the MPU region 0 cannot be changed.

This is example code to configure the MPU driver:

```
// Define MPU memory access permission configuration structure . //
struct mpu_access_rights_t mpuAccessRights{
    .m0UserMode           = kMPUUserNoAccessRights;
    .m0SupervisorMode    = kMPUSupervisorReadWriteExecute;
    .m0Process_identifier = kMPUIdentifierDisable;
    .m1UserMode           = kMPUUserNoAccessRights;
    .m1SupervisorMode    = kMPUSupervisorEqualToUsermode;
    .m1Process_identifier = kMPUIdentifierDisable;
    .m2UserMode           = kMPUUserNoAccessRights;
    .m2SupervisorMode    = kMPUSupervisorEqualToUsermode;
    .m2Process_identifier = kMPUIdentifierDisable;
    .m3UserMode           = kMPUUserNoAccessRights;
    .m3SupervisorMode    = kMPUSupervisorEqualToUsermode;
    .m3Process_identifier = kMPUIdentifierDisable;
    .m4WriteControl      = kMPUAccessDisable;
    .m4ReadControl       = kMPUAccessDisable;
    .m5WriteControl      = kMPUAccessDisable;
    .m5ReadControl       = kMPUAccessDisable;
    .m6WriteControl      = kMPUAccessDisable;
    .m6ReadControl       = kMPUAccessDisable;
    .m7WriteControl      = kMPUAccessDisable;
    .m7ReadControl       = kMPUAccessDisable;
};

// Defines MPU region configuration structure . //
struct mpu_region_config_t mpuRegionConfig{
    .regionNum    = kMPURegionNum00;
    .startAddr    = 0x0;
    .endAddr      = 0xffffffff;
    .accessRights = mpuAccessRights;
};

// Defines MPU user configuration structure . //
struct mpu_user_config_t mpuUserConfig{
    .regionConfig = mpuRegionConfig;
    .next         = NULL;
}mpu_user_config_t;

// Initializes MPU region 0. //
MPU_DRV_Init(0, &mpuUserConfig);
```

MPU Peripheral driver

47.3.3 MPU Interrupt

1. The interrupt corresponding to BUSFAULT causes an error by accessing the core.
2. Definition for the MPU IRQ function.

```
void MPU_DRV_IRQHandler(uint32_t instance)
{
    assert(instance < HW_MPU_INSTANCE_COUNT);

    if (mpu_state_ptrs[instance])
    {
        if (mpu_state_ptrs[instance]->userCallbackFunc)
        {
            // Execute user-defined callback function. //
            (*(mpu_state_ptrs[instance]->userCallbackFunc)) ();
        }
    }
}
```

Data Structures

- struct [mpu_user_config_t](#)
Data The chapter describes the programming interface of the for MPU region initialization. [More...](#)

Variables

- MPU_Type *const [g_mpuBase](#) []
Table of base addresses for MPU instances.
- const IRQn_Type [g_mpuIrqId](#) [MPU_INSTANCE_COUNT]
Table to save MPU IRQ enumeration numbers defined in the CMSIS header file.

MPU Driver

MPU driver user callback function.

The contents of this structure provides a callback function.

- [mpu_status_t MPU_DRV_Init](#) (uint32_t instance, const [mpu_user_config_t](#) *userConfigPtr)
Initializes the MPU driver.
- void [MPU_DRV_Deinit](#) (uint32_t instance)
Deinitializes the MPU region.
- [mpu_status_t MPU_DRV_SetRegionConfig](#) (uint32_t instance, const [mpu_region_config_t](#) *regionConfigPtr)
Configures the MPU region.
- void [MPU_DRV_SetRegionAddr](#) (uint32_t instance, [mpu_region_num_t](#) regionNum, uint32_t startAddr, uint32_t endAddr)
Sets the region start address.
- [mpu_status_t MPU_DRV_SetLowMasterAccessRights](#) (uint32_t instance, [mpu_region_num_t](#) regionNum, [mpu_master_t](#) masterNum, const [mpu_low_masters_access_rights_t](#) *accessRightsPtr)

- Configures the low master access permission.*

 - [mpu_status_t MPU_DRV_SetHighMasterAccessRights](#) (uint32_t instance, [mpu_region_num_t](#) regionNum, [mpu_master_t](#) masterNum, const [mpu_high_masters_access_rights_t](#) *accessRightsPtr)

Configures the high master access permission.

 - void [MPU_DRV_SetRegionValidCmd](#) (uint32_t instance, [mpu_region_num_t](#) regionNum, bool enable)

Sets the MPU region valid.

 - [mpu_status_t MPU_DRV_GetDetailErrorAccessInfo](#) (uint32_t instance, [mpu_access_err_info_t](#) *errInfoArrayPtr)

Gets the MPU access error detail information.

47.3.4 Data Structure Documentation

47.3.4.1 struct mpu_user_config_t

This structure is used when calling the MPU_DRV_Init function.

Data Fields

- [mpu_region_config_t](#) regionConfig
region access permission
- struct MpuUserConfig * next
pointer to the next structure

47.3.5 Function Documentation

47.3.5.1 mpu_status_t MPU_DRV_Init (uint32_t instance, const mpu_user_config_t * userConfigPtr)

Parameters

| | |
|----------------------|--|
| <i>instance</i> | The MPU peripheral instance number. |
| <i>userConfigPtr</i> | The pointer to the MPU user configure structure, see mpu_user_config_t . |
| <i>userStatePtr</i> | The pointer of run time structure. |

Returns

kStatus_MPU_Success means success. Otherwise, means failure.

47.3.5.2 void MPU_DRV_Deinit (uint32_t instance)

MPU Peripheral driver

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The MPU peripheral instance number. |
|-----------------|-------------------------------------|

47.3.5.3 `mpu_status_t MPU_DRV_SetRegionConfig (uint32_t instance, const mpu_region_config_t * regionConfigPtr)`

Parameters

| | |
|------------------------|--|
| <i>instance</i> | The MPU peripheral instance number. |
| <i>regionConfigPtr</i> | The pointer to the MPU user configure structure, see mpu_region_config_t . |

Returns

`kStatus_MPU_Success` means success. Otherwise, means failure.

47.3.5.4 `void MPU_DRV_SetRegionAddr (uint32_t instance, mpu_region_num_t regionNum, uint32_t startAddr, uint32_t endAddr)`

Parameters

| | |
|------------------|-------------------------------------|
| <i>instance</i> | The MPU peripheral instance number. |
| <i>regionNum</i> | The region number. |
| <i>startAddr</i> | Region start address. |
| <i>endAddr</i> | Region end address. |

47.3.5.5 `mpu_status_t MPU_DRV_SetLowMasterAccessRights (uint32_t instance, mpu_region_num_t regionNum, mpu_master_t masterNum, const mpu_low_masters_access_rights_t * accessRightsPtr)`

Parameters

| | |
|------------------------|---|
| <i>instance</i> | The MPU peripheral instance number. |
| <i>regionNum</i> | The MPU region number. |
| <i>masterNum</i> | The MPU master number. |
| <i>accessRightsPtr</i> | A pointer to access permission structure. |

Returns

kStatus_MPU_Success means success. Otherwise, means failure.

47.3.5.6 `mpu_status_t MPU_DRV_SetHighMasterAccessRights (uint32_t instance, mpu_region_num_t regionNum, mpu_master_t masterNum, const mpu_high_masters_access_rights_t * accessRightsPtr)`

Parameters

| | |
|------------------------|---|
| <i>instance</i> | The MPU peripheral instance number. |
| <i>regionNum</i> | The MPU region number. |
| <i>masterNum</i> | The MPU master number. |
| <i>accessRightsPtr</i> | A pointer to access permission structure. |

Returns

kStatus_MPU_Success means success. Otherwise, means failure.

47.3.5.7 `void MPU_DRV_SetRegionValidCmd (uint32_t instance, mpu_region_num_t regionNum, bool enable)`

Parameters

| | |
|------------------|-------------------------------------|
| <i>instance</i> | The MPU peripheral instance number. |
| <i>regionNum</i> | MPU region number. |

MPU Peripheral driver

| | |
|---------------|-----------------------------|
| <i>enable</i> | Enables or disables region. |
|---------------|-----------------------------|

47.3.5.8 mpu_status_t MPU_DRV_GetDetailErrorAccessInfo (uint32_t instance, mpu_access_err_info_t * errInfoArrayPtr)

Parameters

| | |
|-------------------------|---|
| <i>instance</i> | The MPU peripheral instance number. |
| <i>errInfoArray-Ptr</i> | A pointer to access error info structure. |

Returns

kStatus_MPU_Success means success. Otherwise, means failure.

47.3.6 Variable Documentation

47.3.6.1 MPU_Type* const g_mpuBase[]

47.3.6.2 const IRQn_Type g_mpuIrqId[MPU_INSTANCE_COUNT]

Chapter 48

OS Abstraction Layer (OSA)

The Kinetis SDK provides the timer services for all OSA layers.

48.1 Overview

Modules

- [Bare Metal Abstraction Layer](#)
The Kinetis SDK provides the Bare Metal Abstraction Layer for synchronization, mutual exclusion, message queue, etc.
- [FreeRTOS Abstraction Layer](#)
The Kinetis SDK provides the FreeRTOS Abstraction Layer for synchronization, mutual exclusion, message queue, etc.
- [MQX RTOS Abstraction Layer](#)
The Kinetis SDK provides the MQX RTOS Abstraction Layer for synchronization, mutual exclusion, message queue, etc.
- [μC/OS-II Abstraction Layer](#)
The Kinetis SDK provides the μC/OS-II Abstraction Layer for synchronization, mutual exclusion, message queue, etc.
- [μC/OS-III Abstraction Layer](#)
The Kinetis SDK provides the μC/OS-III Abstraction Layer for synchronization, mutual exclusion, message queue, etc.

Typedefs

- typedef void(* [osa_int_handler_t](#))(void)
OSA interrupt handler.

Enumerations

- enum [osa_status_t](#) {
[kStatus_OSA_Success](#) = 0U,
[kStatus_OSA_Error](#) = 1U,
[kStatus_OSA_Timeout](#) = 2U,
[kStatus_OSA_Idle](#) = 3U }
Defines the return status of OSA's functions.
- enum [osa_event_clear_mode_t](#) {
[kEventAutoClear](#) = 0U,
[kEventManualClear](#) = 1U }
The event flags are cleared automatically or manually.
- enum [osa_critical_part_mode_t](#) {
[kCriticalLockSched](#) = 0U,
[kCriticalDisableInt](#) = 1U }
Locks the task scheduler or disables interrupt in critical part.

Overview

Counting Semaphore

- [osa_status_t OSA_SemaCreate](#) ([semaphore_t *pSem](#), [uint8_t initValue](#))
Creates a semaphore with a given value.
- [osa_status_t OSA_SemaWait](#) ([semaphore_t *pSem](#), [uint32_t timeout](#))
Pending a semaphore with timeout.
- [osa_status_t OSA_SemaPost](#) ([semaphore_t *pSem](#))
Signals for someone waiting on the semaphore to wake up.
- [osa_status_t OSA_SemaDestroy](#) ([semaphore_t *pSem](#))
Destroys a previously created semaphore.

Mutex

- [osa_status_t OSA_MutexCreate](#) ([mutex_t *pMutex](#))
Create an unlocked mutex.
- [osa_status_t OSA_MutexLock](#) ([mutex_t *pMutex](#), [uint32_t timeout](#))
Waits for a mutex and locks it.
- [osa_status_t OSA_MutexUnlock](#) ([mutex_t *pMutex](#))
Unlocks a previously locked mutex.
- [osa_status_t OSA_MutexDestroy](#) ([mutex_t *pMutex](#))
Destroys a previously created mutex.

Event signalling

- [osa_status_t OSA_EventCreate](#) ([event_t *pEvent](#), [osa_event_clear_mode_t clearMode](#))
Initializes an event object with all flags cleared.
- [osa_status_t OSA_EventWait](#) ([event_t *pEvent](#), [event_flags_t flagsToWait](#), [bool waitAll](#), [uint32_t timeout](#), [event_flags_t *setFlags](#))
Waits for specified event flags to be set.
- [osa_status_t OSA_EventSet](#) ([event_t *pEvent](#), [event_flags_t flagsToSet](#))
Sets one or more event flags.
- [osa_status_t OSA_EventClear](#) ([event_t *pEvent](#), [event_flags_t flagsToClear](#))
Clears one or more flags.
- [event_flags_t OSA_EventGetFlags](#) ([event_t *pEvent](#))
Gets event flags status.
- [osa_status_t OSA_EventDestroy](#) ([event_t *pEvent](#))
Destroys a previously created event object.

Task management

- [osa_status_t OSA_TaskCreate](#) ([task_t task](#), [uint8_t *name](#), [uint16_t stackSize](#), [task_stack_t *stackMem](#), [uint16_t priority](#), [task_param_t param](#), [bool usesFloat](#), [task_handler_t *handler](#))
Creates a task.
- [osa_status_t OSA_TaskDestroy](#) ([task_handler_t handler](#))
Destroys a previously created task.
- [osa_status_t OSA_TaskYield](#) ([void](#))
Puts the active task to the end of scheduler's queue.
- [task_handler_t OSA_TaskGetHandler](#) ([void](#))
Gets the handler of active task.
- [uint16_t OSA_TaskGetPriority](#) ([task_handler_t handler](#))
Gets the priority of a task.

- `osa_status_t OSA_TaskSetPriority (task_handler_t handler, uint16_t priority)`
Sets the priority of a task.

Message queues

- `msg_queue_handler_t OSA_MsgQCreate (msg_queue_t *queue, uint16_t message_number, uint16_t message_size)`
Initializes a message queue.
- `osa_status_t OSA_MsgQPut (msg_queue_handler_t handler, void *pMessage)`
Puts a message at the end of the queue.
- `osa_status_t OSA_MsgQGet (msg_queue_handler_t handler, void *pMessage, uint32_t timeout)`
Reads and remove a message at the head of the queue.
- `osa_status_t OSA_MsgQDestroy (msg_queue_handler_t handler)`
Destroys a previously created queue.

Memory Management

- `void * OSA_MemAlloc (size_t size)`
Reserves the requested amount of memory in bytes.
- `void * OSA_MemAllocZero (size_t size)`
Reserves the requested amount of memory in bytes and initializes it to 0.
- `osa_status_t OSA_MemFree (void *ptr)`
Releases the memory previously reserved.

Time management

- `void OSA_TimeDelay (uint32_t delay)`
Delays execution for a number of milliseconds.
- `uint32_t OSA_TimeGetMsec (void)`
Gets the current time since system boot in milliseconds.

Interrupt management

- `osa_int_handler_t OSA_InstallIntHandler (int32_t IRQNumber, osa_int_handler_t handler)`
Installs the interrupt handler.

Critical section

- `void OSA_EnterCritical (osa_critical_part_mode_t mode)`
Enters the critical part to ensure some code is not preempted.
- `OSA_ExitCritical (osa_critical_part_mode_t mode)`
Exits the critical part.

OSA initialize

- `osa_status_t OSA_Init (void)`
Initializes the RTOS services.
- `osa_status_t OSA_Start (void)`
Starts the RTOS.

Overview

48.1.1 OS Abstraction Layer

Overview

Operating System Abstraction layer (OSA) provides a common set of services for drivers and applications so that they can work with or without the operating system. OSA provides services that abstract most of the OS kernel functionality. These services can either be mapped to the target OS functions directly, or implemented by OSA when no OS is used (bare metal) or when the service does not exist in the target OS. Freescale Kinetis SDK implements the OS abstraction layer for MQX™ RTOS, Free RTOS, μ C/OS, and for OS-less usage (bare metal). The bare metal OS abstraction implementation is selected as the default option.

OSA provides these services: task management, semaphore, mutex, event, message queue, memory allocator, critical part, and time functions.

Task Management

With OSA, applications can create and destroy tasks dynamically. These services are mapped to the task functions of RTOSes. For bare metal, a function poll mechanism simulates a task scheduler.

OSA supports task priorities 0~15, where priority 0 is the highest priority and priority 15 is the lowest priority.

To create a task, applications must prepare different resources on different RTOSes. For example, μ C/OS-II and μ C/OS-III need pre-allocated task stack while other RTOSes do not need this. The μ C/OS-III needs pre-allocated task control block OS_TCB while other RTOSes do not. To mask the differences, OSA uses a macro OSA_TASK_DEFINE to prepare resources for task creation. Then the function [OSA_TaskCreate\(\)](#) creates a task based on the resources. This method makes it easy to use a copy of code on different RTOSes. However, it is not mandatory to use the OSA_TASK_DEFINE. Applications can also prepare the resources manually. There are two methods to create a task:

1. Use the OSA_TASK_DEFINE macro and the function [OSA_TaskCreate\(\)](#). The macro OSA_TASK_DEFINE declares a task handler and task stack statically. The function [OSA_TaskCreate\(\)](#) creates task base-on the resources declared by OSA_TASK_DEFINE.

This is an example code to create a task using method 1:

```
// Define the task with entry function task_func.
OSA_TASK_DEFINE(task_func, TASK_STACK_SIZE);

void main(void)
{
    task_param_t parameter;

    // Create the task.
    OSA_TaskCreate(task_func,                // Task function.
                  "my_task",                // Task name.
                  TASK_STACK_SIZE,         // Stack size.
                  task_func_stack,         // Stack address.
                  TASK_PRIO,               // Task priority.
                  parameter,               // Parameter.
                  false,                   // Use float register or not.
                  &task_func_task_handler); // Task handler.

    // ...
}
```

2. Prepare resources manually, then use the function `OSA_TaskCreate()` to create a task.
For example:

```

task_param_t parameter;
task_handler_t task_handler;

#if defined(FSL_RTOS_UCOSII)
task_stack_t task_stack[TASK_STACK_SIZE/sizeof(task_stack_t)];
OSA_TaskCreate(task_func,           // Task function.
               "my_task",           // Task name.
               TASK_STACK_SIZE,     // Stack size.
               task_stack,          // Stack address.
               TASK_PRIO,           // Task priority.
               parameter,           // Parameter.
               false,               // Use float register or not.
               &task_handler);      // Task handler.

#elif defined(FSL_RTOS_UCOSIII)
task_stack_t task_stack[TASK_STACK_SIZE/sizeof(task_stack_t)];
OS_TCB TCB_task;
task_handler = &TCB_task;
OSA_TaskCreate(task_func,           // Task function.
               "my_task",           // Task name.
               TASK_STACK_SIZE,     // Stack size.
               task_stack,          // Stack address.
               TASK_PRIO,           // Task priority.
               parameter,           // Parameter.
               false,               // Use float register or not.
               &task_handler);      // Task handler.

#else // For MQX RTOS, FreeRTOS OS and bare metal.
OSA_TaskCreate(task_func,           // Task function.
               "my_task",           // Task name.
               TASK_STACK_SIZE,     // Stack size.
               NULL,                // Stack address.
               TASK_PRIO,           // Task priority.
               parameter,           // Parameter.
               false,               // Use float register or not.
               &task_handler);      // Task handler.
#endif

```

Method one is easy to use. The disadvantage is that one task function can only create one task instance. Method two can create multiple task instances using one task function, but the code must be divided by macros for different RTOSes. Applications can choose either method according to requirements.

After a task is created successfully, task handler can be used to manage the task, for example, get or set task priority, destroy task and so on.

If task is not used any more, use the `OSA_TaskDestroy()` function to destroy the task. If the task function does not contain an infinite loop, or, in other words, the task function returns, call the `OSA_TaskDestroy()` function at the end of the task function.

Semaphore

The OSA provides the drivers and applications with a counting semaphore. It can be used either to synchronize tasks or to synchronize a task and an ISR.

A semaphore must be initialized with the `OSA_SemaCreate()` function before using. The semaphore can be initialized with an initial value. When the semaphore is not used any more, use the `OSA_SemaDestroy()` function to destroy it.

Overview

Note that if multiple tasks are waiting for one semaphore, different RTOSes may have different behaviors, for example, wake up the task wait first or wake up the task with highest priority. Bare metal semaphore does not support multiple tasks wait with timeout.

This is an example code to create and destroy a semaphore:

```
semaphore_t sem;

// Initialize the semaphore with initial value.
OSA_SemaCreate(&sem, 0);

// Destroy the semaphore.
OSA_SemaDestroy(&sem);
```

The function `OSA_SemaWait()` waits a semaphore within the timeout (in milliseconds). Passing a value 0 as a timeout means return immediately and passing the `OSA_WAIT_FOREVER` means wait indefinitely. This function should not be used in the ISR.

The function `OSA_SemaPost()` wakes up task which is waiting for the semaphore.

Mutex

A mutex is used for the mutual exclusion of tasks when they access a shared resource. OSA provides a non-recursive mutex, which means a task cannot try to lock a mutex it has already locked.

A mutex must be initialized to an unlocked status with the `OSA_MutexCreate()` function before using. When the mutex is not used any more, use the `OSA_MutexDestroy()` function to destroy it.

This is example code to create and destroy a mutex:

```
mutex_t mutex;

// Initialize the mutex
OSA_MutexCreate(&mutex);

// Destroy the mutex
OSA_MutexDestroy(&mutex);
```

The function `OSA_MutexLock()` waits to lock a mutex within the timeout (in milliseconds). Passing a value 0 as a timeout means return immediately and passing the `OSA_WAIT_FOREVER` means waiting indefinitely.

The function `OSA_MutexUnlock()` unlocks a mutex which is locked by the current task.

Event

When using event, notice that if multiple tasks are waiting on one event, different RTOSes may have different behaviors. For example, only the first task in waiting list is woken up, or all tasks in waiting list are woken up. Bare metal event does not support multiple task waiting with timeout.

OSA provides two types of events:

1. Auto-clear, which occurs when some task has get flags it is waiting for. These flags are cleared automatically.

2. Manual-clear, which means that the flags could only be cleared manually.

The clear mode is a property of an event. After an event is created, the clear mode can't be changed.

An event must be initialized with the [OSA_EventCreate\(\)](#) function before using. When it is created, its flags are all cleared. When the event is not used any more, use the [event_destory\(\)](#) function to destroy it.

This is example code to create and destroy an event object:

```
event_t event;

// Initialize the event
OSA_EventCreate(&event, kEventAutoClear);

// Destroy the event
OSA_EventDestroy(&event);
```

The function [OSA_EventWait\(\)](#) waits for specified flags of an event with the timeout (in milliseconds). Passing a value 0 as a timeout means return immediately and passing the [OSA_WAIT_FOREVER](#) means wait indefinitely. This function can be configured to wait for all specified flags or wait for any one flag in specified flags. The parameter [setFlags](#) saves the flags which wake up the waiting task. This function should not be used in the ISR.

The functions [OSA_EventSet\(\)](#) and [OSA_EventClear\(\)](#) are used to set and clear specified flags of an event. The function [OSA_EventGetFlags\(\)](#) is used to get current event flags.

Message Queue

OSA provides the FIFO message queue. All messages in a queue have the same size. Message queue holds an internal memory area to save messages. While putting the message, the message entity is copied to this internal memory area. While getting message, message is copied from the internal memory area.

Note that if multiple tasks are waiting on one message queue, different RTOSes may have different behaviors. Bare metal message queue does not support multiple task waiting with timeout.

To create a message queue, use [MSG_QUEUE_DECLARE\(\)](#) and [OSA_MsgQCreate\(\)](#) functions as shown here:

```
// Declare the message queue.
MSG_QUEUE_DECLARE(my_message, msg_num, msg_size);

void main(void)
{
    msg_queue_handler_t handler;
    handler = OSA_MsgQCreate(my_message, msg_num, msg_size);
    // ...
}
```

Note that the parameter [message_size](#) is in words and not in bytes. It means that the message queue can only transfer messages of multiple-byte size.

The function [OSA_MsgQPut\(\)](#) puts a message to the queue. If the queue is full, an error returns.

The function [OSA_MsgQGet\(\)](#) waits for a timeout in milliseconds to get the message from the queue. Passing a value 0 as a timeout means return immediately and passing the [OSA_WAIT_FOREVER](#) means wait indefinitely. This function should not be used in the ISR.

Overview

If the queue is not used any more, use the [OSA_MsgQDestroy\(\)](#) function to destroy it.

Critical Section

OSA provides two types of critical sections. The first type disables the interrupt while the second type only disables the scheduler to stop the task preemption.

Memory Allocator

The function [OSA_MemAlloc\(\)](#) allocates memory with specified size. The function [OSA_MemAllocZero\(\)](#) allocates and cleans the memory. The function [OSA_MemFree\(\)](#) frees the memory. For RTOSes that have internal memory manager, such as the MQX RTOS, OSA maps these functions directly. For other RTOSes or bare metal, the standard functions malloc/calloc/free are used.

Time Functions

OSA only provides two time functions, [OSA_TimeDelay\(\)](#) and [OSA_TimeGetMsec\(\)](#). The function [OSA_TimeDelay\(\)](#) delays specified time in milliseconds, while the function [OSA_TimeGetMsec\(\)](#) gets the system time in milliseconds since POR.

Interrupt priority

For some RTOSes, a proper interrupt priority must be set if system services are called in this interrupt service routine.

For MQX RTOS, follow these criteria:

1. Interrupt priority must be an even number.
2. Interrupt priority $\geq 2 * \text{MQX_HARDWARE_INTERRUPT_LEVEL_MAX}$.

For FreeRTOS OS, the interrupt priority is defined in the configuration file FreeRTOSConfig.h. In the current configuration, priority 1~15 can be used for the ARM Cortex[®]-M4. See the FreeRTOS OS' official documents for details.

OSA initialization

To initialize and start RTOSes, OSA uses abstract functions [OSA_Init\(\)](#) and [OSA_Start\(\)](#). Call [OSA_Init\(\)](#) after calling hardware_init().

This example shows how to use [OSA_Init\(\)](#) and [OSA_Start\(\)](#) functions:

```
#include <fsl_os_abstraction.h>

void task_func(task_param_t param)
{
    //...
}

OSA_TASK_DEFINE(task_func, 512);

#if defined(FSL_RTOS_MQX)
void Main_Task(uint32_t param);
TASK_TEMPLATE_STRUCT MQX_template_list[] =
```

```

{
  { 1L, Main_Task, 256L, MQX_MAIN_TASK_PRIORITY, "Main", MQX_AUTO_START_TASK},
  { 0L, 0L,          0L,   0L,                    0L,          0L }
};
#endif

#if defined(FSL_RTOS_MQX)
void Main_Task(uint32_t param)
#else
void main(void)
#endif
{
    hardware_init();

    OSA_Init();
    // Other application initialization functions.
    // ...
    OSA_TaskCreate(task_func,           // Task function.
                  "my_task",           // Task name.
                  512,                 // Stack size.
                  task_func_stack,     // Stack address.
                  5,                   // Task priority.
                  (task_param_t)0,     // Parameter.
                  false,               // Use float register or not.
                  &task_func_task_handler); // Task handler.

    OSA_Start();
}

```

Note that, for other RTOSes, the task scheduler is started up by the `OSA_Start()` function. However, for MQX RTOS, the task scheduler is started before the `OSA_Init()` function call. When creating tasks in the `Main_Task()` function with the MQX RTOS, the newly created task runs immediately if it has the highest priority. However, for other RTOSes, all newly created tasks do not run until the `OSA_Start()` function executes.

48.2 Typedef Documentation

48.2.1 typedef void(* osa_int_handler_t)(void)

48.3 Enumeration Type Documentation

48.3.1 enum osa_status_t

Enumerator

kStatus_OSA_Success Success.

kStatus_OSA_Error Failed.

kStatus_OSA_Timeout Timeout occurs while waiting.

kStatus_OSA_Idle Used for bare metal only, the wait object is not ready and timeout still not occur.

48.3.2 enum osa_event_clear_mode_t

Enumerator

kEventAutoClear The flags of the event will be cleared automatically.

Function Documentation

kEventManualClear The flags of the event will be cleared manually.

48.3.3 enum osa_critical_section_mode_t

Enumerator

kCriticalLockSched Lock scheduler in critical part.

kCriticalDisableInt Disable interrupt in critical selection.

48.4 Function Documentation

48.4.1 osa_status_t OSA_SemaCreate (semaphore_t * pSem, uint8_t initValue)

This function creates a semaphore and sets the value to the parameter initValue.

Parameters

| | |
|------------------|---|
| <i>pSem</i> | Pointer to the semaphore. |
| <i>initValue</i> | Initial value the semaphore will be set to. |

Return values

| | |
|----------------------------|--|
| <i>kStatus_OSA_Success</i> | The semaphore is created successfully. |
| <i>kStatus_OSA_Error</i> | The semaphore cannot be created. |

Example:

```
semaphore_t mySem;
OSA_SemaCreate (&mySem, 0);
```

48.4.2 osa_status_t OSA_SemaWait (semaphore_t * pSem, uint32_t timeout)

This function checks the semaphore's counting value. If it is positive, decreases it and returns kStatus_OSA_Success. Otherwise, a timeout is used to wait.

Parameters

| | |
|-------------|---------------------------|
| <i>pSem</i> | Pointer to the semaphore. |
|-------------|---------------------------|

| | |
|----------------|--|
| <i>timeout</i> | The maximum number of milliseconds to wait if semaphore is not positive. Pass OSA_WAIT_FOREVER to wait indefinitely, pass 0 will return kStatus_OSA_Timeout immediately. |
|----------------|--|

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | The semaphore is received. |
| <i>kStatus_OSA_Timeout</i> | The semaphore is not received within the specified 'timeout'. |
| <i>kStatus_OSA_Error</i> | An incorrect parameter was passed. |
| <i>kStatus_OSA_Idle</i> | The semaphore is not available and 'timeout' is not exhausted, This is only for bare metal. |

Note

With bare metal, a semaphore cannot be waited on by more than one task at the same time.

Example:

```
osa_status_t status;
status = OSA_SemaWait(&mySem, 100);
switch(status)
{
    //...
}
```

48.4.3 `osa_status_t OSA_SemaPost (semaphore_t * pSem)`

Wakes up one task that is waiting on the semaphore. If no task is waiting, increases the semaphore's counting value.

Parameters

| | |
|-------------|-------------------------------------|
| <i>pSem</i> | Pointer to the semaphore to signal. |
|-------------|-------------------------------------|

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | The semaphore is successfully signaled. |
| <i>kStatus_OSA_Error</i> | The object cannot be signaled or invalid parameter. |

Function Documentation

Example:

```
osa_status_t status;
status = OSA_SemaPost (&mySem);
switch(status)
{
    //...
}
```

48.4.4 `osa_status_t OSA_SemaDestroy (semaphore_t * pSem)`

Parameters

| | |
|-------------|--------------------------------------|
| <i>pSem</i> | Pointer to the semaphore to destroy. |
|-------------|--------------------------------------|

Return values

| | |
|----------------------------|--|
| <i>kStatus_OSA_Success</i> | The semaphore is successfully destroyed. |
| <i>kStatus_OSA_Error</i> | The semaphore cannot be destroyed. |

Example:

```
osa_status_t status;
status = OSA_SemaDestroy (&mySem);
switch(status)
{
    //...
}
```

48.4.5 `osa_status_t OSA_MutexCreate (mutex_t * pMutex)`

This function creates a non-recursive mutex and sets it to unlocked status.

Parameters

| | |
|---------------|-----------------------|
| <i>pMutex</i> | Pointer to the Mutex. |
|---------------|-----------------------|

Return values

| | |
|----------------------------|------------------------------------|
| <i>kStatus_OSA_Success</i> | The mutex is created successfully. |
|----------------------------|------------------------------------|

| | |
|--------------------------|------------------------------|
| <i>kStatus_OSA_Error</i> | The mutex cannot be created. |
|--------------------------|------------------------------|

Example:

```
mutex_t myMutex;
osa_status_t status;
status = OSA_MutexCreate (&myMutex);
switch (status)
{
    //...
}
```

48.4.6 `osa_status_t OSA_MutexLock (mutex_t * pMutex, uint32_t timeout)`

This function checks the mutex’s status. If it is unlocked, locks it and returns the `kStatus_OSA_Success`. Otherwise, waits for a timeout in milliseconds to lock.

Parameters

| | |
|----------------|---|
| <i>pMutex</i> | Pointer to the Mutex. |
| <i>timeout</i> | The maximum number of milliseconds to wait for the mutex. If the mutex is locked, Pass the value <code>OSA_WAIT_FOREVER</code> will wait indefinitely, pass 0 will return <code>kStatus_OSA_Timeout</code> immediately. |

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | The mutex is locked successfully. |
| <i>kStatus_OSA_Timeout</i> | Timeout occurred. |
| <i>kStatus_OSA_Error</i> | Incorrect parameter was passed. |
| <i>kStatus_OSA_Idle</i> | The mutex is not available and 'timeout' is not exhausted, This is only for bare metal. |

Note

This is non-recursive mutex, a task cannot try to lock the mutex it has locked.

Example:

```
osa_status_t status;
status = OSA_MutexLock (&myMutex, 100);
switch (status)
{
    //...
}
```

48.4.7 `osa_status_t OSA_MutexUnlock (mutex_t * pMutex)`

Function Documentation

Parameters

| | |
|---------------|-----------------------|
| <i>pMutex</i> | Pointer to the Mutex. |
|---------------|-----------------------|

Return values

| | |
|----------------------------|--|
| <i>kStatus_OSA_Success</i> | The mutex is successfully unlocked. |
| <i>kStatus_OSA_Error</i> | The mutex cannot be unlocked or invalid parameter. |

Example:

```
osa_status_t status;
status = OSA_MutexUnlock (&myMutex);
switch (status)
{
    //...
}
```

48.4.8 `osa_status_t OSA_MutexDestroy (mutex_t * pMutex)`

Parameters

| | |
|---------------|-----------------------|
| <i>pMutex</i> | Pointer to the Mutex. |
|---------------|-----------------------|

Return values

| | |
|----------------------------|--------------------------------------|
| <i>kStatus_OSA_Success</i> | The mutex is successfully destroyed. |
| <i>kStatus_OSA_Error</i> | The mutex cannot be destroyed. |

Example:

```
osa_status_t status;
status = OSA_MutexDestroy (&myMutex);
switch (status)
{
    //...
}
```

48.4.9 `osa_status_t OSA_EventCreate (event_t * pEvent, osa_event_clear_mode_t clearMode)`

This function creates an event object and set its clear mode. If clear mode is `kEventAutoClear`, when a task gets the event flags, these flags will be cleared automatically. If clear mode is `kEventManualClear`, these flags must be cleared manually.

Parameters

| | |
|------------------|--|
| <i>pEvent</i> | Pointer to the event object to initialize. |
| <i>clearMode</i> | The event is auto-clear or manual-clear. |

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | The event object is successfully created. |
| <i>kStatus_OSA_Error</i> | The event object is not created. |

Example:

```
event_t myEvent;
OSA_EventCreate(&myEvent, kEventAutoClear);
```

48.4.10 **osa_status_t OSA_EventWait (event_t * pEvent, event_flags_t flagsToWait, bool waitAll, uint32_t timeout, event_flags_t * setFlags)**

This function waits for a combination of flags to be set in an event object. Applications can wait for any/all bits to be set. Also this function could obtain the flags who wakeup the waiting task.

Parameters

| | |
|--------------------|---|
| <i>pEvent</i> | Pointer to the event. |
| <i>flagsToWait</i> | Flags that to wait. |
| <i>waitAll</i> | Wait all flags or any flag to be set. |
| <i>timeout</i> | The maximum number of milliseconds to wait for the event. If the wait condition is not met, pass OSA_WAIT_FOREVER will wait indefinitely, pass 0 will return kStatus_OSA_Timeout immediately. |
| <i>setFlags</i> | Flags that wakeup the waiting task are obtained by this parameter. |

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | The wait condition met and function returns successfully. |
| <i>kStatus_OSA_Timeout</i> | Has not met wait condition within timeout. |
| <i>kStatus_OSA_Error</i> | An incorrect parameter was passed. |

Function Documentation

| | |
|-------------------------|--|
| <i>kStatus_OSA_Idle</i> | The wait condition is not met and 'timeout' is not exhausted, This is only for bare metal. |
|-------------------------|--|

Note

1. With bare metal, a event object cannot be waited on by more than one tasks at the same time.
 1. Please pay attention to the flags bit width, FreeRTOS uses the most significant 8 bis as control bits, so do not wait these bits while using FreeRTOS.

Example:

```
osa_status_t status;
event_flags_t setFlags;
status = OSA_EventWait(&myEvent, 0x01, true, 100, &setFlags);
switch (status)
{
    //...
}
```

48.4.11 `osa_status_t OSA_EventSet (event_t * pEvent, event_flags_t flagsToSet)`

Sets specified flags of an event object.

Parameters

| | |
|-------------------|-----------------------|
| <i>pEvent</i> | Pointer to the event. |
| <i>flagsToSet</i> | Flags to be set. |

Return values

| | |
|----------------------------|------------------------------------|
| <i>kStatus_OSA_Success</i> | The flags were successfully set. |
| <i>kStatus_OSA_Error</i> | An incorrect parameter was passed. |

Example:

```
osa_status_t status;
status = OSA_EventSet(&myEvent, 0x01);
switch (status)
{
    //...
}
```

48.4.12 `osa_status_t OSA_EventClear (event_t * pEvent, event_flags_t flagsToClear)`

Clears specified flags of an event object.

Parameters

| | |
|---------------------|-----------------------|
| <i>pEvent</i> | Pointer to the event. |
| <i>flagsToClear</i> | Flags to be clear. |

Return values

| | |
|----------------------------|--------------------------------------|
| <i>kStatus_OSA_Success</i> | The flags were successfully cleared. |
| <i>kStatus_OSA_Error</i> | An incorrect parameter was passed. |

Example:

```
osa_status_t status;
status = OSA_EventClear(&myEvent, 0x01);
switch (status)
{
    //...
}
```

48.4.13 event_flags_t OSA_EventGetFlags (event_t * pEvent)

Gets the event flags status.

Parameters

| | |
|---------------|-----------------------|
| <i>pEvent</i> | Pointer to the event. |
|---------------|-----------------------|

Returns

event_flags_t Current event flags.

Example:

```
event_flags_t flags;
flags = OSA_EventGetFlags(&myEvent);
```

48.4.14 osa_status_t OSA_EventDestroy (event_t * pEvent)

Function Documentation

Parameters

| | |
|---------------|-----------------------|
| <i>pEvent</i> | Pointer to the event. |
|---------------|-----------------------|

Return values

| | |
|----------------------------|--------------------------------------|
| <i>kStatus_OSA_Success</i> | The event is successfully destroyed. |
| <i>kStatus_OSA_Error</i> | Event destruction failed. |

Example:

```

osa_status_t status;
status = OSA_EventDestroy(&myEvent);
switch (status)
{
    //...
}

```

48.4.15 **osa_status_t OSA_TaskCreate (task_t task, uint8_t * name, uint16_t stackSize, task_stack_t * stackMem, uint16_t priority, task_param_t param, bool usesFloat, task_handler_t * handler)**

This function is used to create task based on the resources defined by the macro OSA_TASK_DEFINE.

Parameters

| | |
|------------------|--|
| <i>task</i> | The task function entry. |
| <i>name</i> | The name of this task. |
| <i>stackSize</i> | The stack size in byte. |
| <i>stackMem</i> | Pointer to the stack. |
| <i>priority</i> | Initial priority of the task. |
| <i>param</i> | Pointer to be passed to the task when it is created. |
| <i>usesFloat</i> | This task will use float register or not. |
| <i>handler</i> | Pointer to the task handler. |

Return values

| | |
|----------------------------|-----------------------------------|
| <i>kStatus_OSA_Success</i> | The task is successfully created. |
|----------------------------|-----------------------------------|

| | |
|--------------------------|------------------------------|
| <i>kStatus_OSA_Error</i> | The task cannot be created.. |
|--------------------------|------------------------------|

Example:

```

osa_status_t status;
OSA_TASK_DEFINE(task_func, stackSize);
status = OSA_TaskCreate(task_func,
    "task_name",
    stackSize,
    task_func_stack,
    prio,
    param,
    false,
    &task_func_task_handler);

switch (status)
{
    //...
}

```

Note

Use the return value to check whether the task is created successfully. DO NOT check handler. For uC/OS-III, handler is not NULL even if the task creation has failed.

48.4.16 *osa_status_t* OSA_TaskDestroy (*task_handler_t handler*)

Parameters

| | |
|----------------|--|
| <i>handler</i> | The handler of the task to destroy. Returned by the OSA_TaskCreate function. |
|----------------|--|

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | The task was successfully destroyed. |
| <i>kStatus_OSA_Error</i> | Task destruction failed or invalid parameter. |

Example:

```

osa_status_t status;
status = OSA_TaskDestroy(myTaskHandler);
switch (status)
{
    //...
}

```

48.4.17 *osa_status_t* OSA_TaskYield (*void*)

When a task calls this function, it gives up the CPU and puts itself to the end of a task ready list.

Function Documentation

Return values

| | |
|----------------------------|--------------------------------------|
| <i>kStatus_OSA_Success</i> | The function is called successfully. |
| <i>kStatus_OSA_Error</i> | Error occurs with this function. |

Example:

```
osa_status_t status;
status = OSA_TaskYield();
switch (status)
{
    //...
}
```

48.4.18 task_handler_t OSA_TaskGetHandler (void)

Returns

Handler to current active task.

Example:

```
task_handler_t handler = OSA_TaskYield();
```

48.4.19 uint16_t OSA_TaskGetPriority (task_handler_t *handler*)

Parameters

| | |
|----------------|---|
| <i>handler</i> | The handler of the task whose priority is received. |
|----------------|---|

Returns

Task's priority.

Example:

```
uint16_t taskPrio = OSA_TaskGetPriority(taskHandler);
```

48.4.20 osa_status_t OSA_TaskSetPriority (task_handler_t *handler*, uint16_t *priority*)

Parameters

| | |
|-----------------|---|
| <i>handler</i> | The handler of the task whose priority is received. |
| <i>priority</i> | The priority to set. |

Return values

| | |
|----------------------------|--------------------------------------|
| <i>kStatus_OSA_Success</i> | Task's priority is set successfully. |
| <i>kStatus_OSA_Error</i> | Task's priority cannot be set. |

Example:

```
osa_status_t status;
status = OSA_TaskSetPriority(taskHandler, newPrio);
switch (status)
{
    //...
}
```

48.4.21 msg_queue_handler_t OSA_MsgQCreate (msg_queue_t * queue, uint16_t message_number, uint16_t message_size)

This function initializes the message queue that was declared previously. This is an example demonstrating the use of the function:

```
msg_queue_handler_t handler;
MSG_QUEUE_DECLARE(my_message, msg_num, msg_size);
handler = OSA_MsgQCreate(my_message, msg_num, msg_size);
```

Parameters

| | |
|-----------------------|---|
| <i>queue</i> | The queue declared through the MSG_QUEUE_DECLARE macro. |
| <i>message_number</i> | The number of elements in the queue. |
| <i>message_size</i> | Size of every elements in words. |

Returns

Handler to access the queue for put and get operations. If message queue created failed, return 0.

48.4.22 osa_status_t OSA_MsgQPut (msg_queue_handler_t handler, void * pMessage)

This function puts a message to the end of the message queue. If the queue is full, this function returns the kStatus_OSA_Error;

Function Documentation

Parameters

| | |
|-----------------|--|
| <i>handler</i> | Queue handler returned by the OSA_MsgQCreate function. |
| <i>pMessage</i> | Pointer to the message to be put into the queue. |

Return values

| | |
|----------------------------|--|
| <i>kStatus_OSA_Success</i> | Message successfully put into the queue. |
| <i>kStatus_OSA_Error</i> | The queue was full or an invalid parameter was passed. |

Example:

```
osa_status_t status;
struct MESSAGE messageToPut = ...;
status = OSA_MsgQPut(queueHandler, &messageToPut);
switch (status)
{
    //...
}
```

48.4.23 **osa_status_t OSA_MsgQGet (msg_queue_handler_t handler, void * pMessage, uint32_t timeout)**

This function gets a message from the head of the message queue. If the queue is empty, timeout is used to wait.

Parameters

| | |
|-----------------|--|
| <i>handler</i> | Queue handler returned by the OSA_MsgQCreate function. |
| <i>pMessage</i> | Pointer to a memory to save the message. |
| <i>timeout</i> | The number of milliseconds to wait for a message. If the queue is empty, pass OSA_WAIT_FOREVER will wait indefinitely, pass 0 will return kStatus_OSA_Timeout immediately. |

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | Message successfully obtained from the queue. |
| <i>kStatus_OSA_Timeout</i> | The queue remains empty after timeout. |
| <i>kStatus_OSA_Error</i> | Invalid parameter. |

| | |
|-------------------------|---|
| <i>kStatus_OSA_Idle</i> | The queue is empty and 'timeout' is not exhausted, This is only for bare metal. |
|-------------------------|---|

Note

With bare metal, there should be only one process waiting on the queue.

Example:

```
osa_status_t status;
struct MESSAGE messageToGet;
status = OSA_MsgQGet(queueHandler, &messageToGet, 100);
switch (status)
{
    //...
}
```

48.4.24 **osa_status_t OSA_MsgQDestroy (msg_queue_handler_t handler)**

Parameters

| | |
|----------------|--|
| <i>handler</i> | Queue handler returned by the OSA_MsgQCreate function. |
|----------------|--|

Return values

| | |
|----------------------------|---------------------------------------|
| <i>kStatus_OSA_Success</i> | The queue was successfully destroyed. |
| <i>kStatus_OSA_Error</i> | Message queue destruction failed. |

Example:

```
osa_status_t status;
status = OSA_MsgQDestroy(queueHandler);
switch (status)
{
    //...
}
```

48.4.25 **void* OSA_MemAlloc (size_t size)**

Function Documentation

Parameters

| | |
|-------------|-----------------------------|
| <i>size</i> | Amount of bytes to reserve. |
|-------------|-----------------------------|

Returns

Pointer to the reserved memory. NULL if memory could not be allocated.

48.4.26 void* OSA_MemAllocZero (size_t size)

Parameters

| | |
|-------------|-----------------------------|
| <i>size</i> | Amount of bytes to reserve. |
|-------------|-----------------------------|

Returns

Pointer to the reserved memory. NULL if memory could not be allocated.

48.4.27 osa_status_t OSA_MemFree (void * ptr)

Parameters

| | |
|------------|---|
| <i>ptr</i> | Pointer to the start of the memory block previously reserved. |
|------------|---|

Return values

| | |
|----------------------------|--------------------------------------|
| <i>kStatus_OSA_Success</i> | Memory correctly freed. |
| <i>kStatus_OSA_Error</i> | Error occurs during free the memory. |

48.4.28 void OSA_TimeDelay (uint32_t delay)

Parameters

| | |
|--------------|-----------------------------------|
| <i>delay</i> | The time in milliseconds to wait. |
|--------------|-----------------------------------|

48.4.29 uint32_t OSA_TimeGetMsec (void)

Returns

Current time in milliseconds.

48.4.30 osa_int_handler_t OSA_InstallIntHandler (int32_t IRQNumber, osa_int_handler_t handler)

Parameters

| | |
|------------------|-----------------------------------|
| <i>IRQNumber</i> | IRQ number of the interrupt. |
| <i>handler</i> | The interrupt handler to install. |

Returns

This function returns the old interrupt handler installed in vector table. If could not install ISR, this function returns NULL; The return value could be compared with OSA_DEFAULT_INT_HANDLER to detect whether this is the first interrupt handler installed.

48.4.31 void OSA_EnterCritical (osa_critical_part_mode_t mode)

Parameters

| | |
|-------------|---|
| <i>mode</i> | Lock task scheduler of disable interrupt in critical part. Pass kCriticalLockSched to lock task scheduler, pass kCriticalDisableInt to disable interrupt. |
|-------------|---|

48.4.32 void OSA_ExitCritical (osa_critical_part_mode_t mode)

Function Documentation

Parameters

| | |
|-------------|---|
| <i>mode</i> | Lock task scheduler of disable interrupt in critical part. Pass kCriticalLockSched to lock task scheduler, pass kCriticalDisableInt to disable interrupt. |
|-------------|---|

48.4.33 `osa_status_t OSA_Init (void)`

This function sets up the basic RTOS services. It should be called first in the main function.

Return values

| | |
|----------------------------|---|
| <i>kStatus_OSA_Success</i> | RTOS services are initialized successfully. |
| <i>kStatus_OSA_Error</i> | Error occurs during initialization. |

48.4.34 `osa_status_t OSA_Start (void)`

This function starts the RTOS scheduler and may never return.

Return values

| | |
|----------------------------|----------------------------------|
| <i>kStatus_OSA_Success</i> | RTOS starts to run successfully. |
| <i>kStatus_OSA_Error</i> | Error occurs when start RTOS. |

48.5 Bare Metal Abstraction Layer

The Kinetis SDK provides the Bare Metal Abstraction Layer for synchronization, mutual exclusion, message queue, etc.

48.5.1 Overview

Data Structures

- struct [semaphore_t](#)
Type for an semaphore. [More...](#)
- struct [mutex_t](#)
Type for a mutex. [More...](#)
- struct [event_t](#)
Type for an event object. [More...](#)
- struct [task_control_block_t](#)
Task control block for bare metal. [More...](#)
- struct [msg_queue_t](#)
Type for a message queue. [More...](#)

Macros

- #define [FSL_OSA_BM_TIMER_NONE](#) 0U
Bare Metal does not use timer.
- #define [FSL_OSA_BM_TIMER_LPTMR](#) 1U
Bare Metal uses LPTMR as timer.
- #define [FSL_OSA_BM_TIMER_CONFIG](#) [FSL_OSA_BM_TIMER_LPTMR](#)
Configure what timer is used in Bare Metal.
- #define [OSA_WAIT_FOREVER](#) 0xFFFFFFFFU
Constant to pass as timeout value in order to wait indefinitely.
- #define [TASK_MAX_NUM](#) 5
How many tasks can the bare metal support.
- #define [FSL_OSA_TIME_RANGE](#) 0xFFFFU
OSA's time range in millisecond, OSA time wraps if exceeds this value.
- #define [OSA_DEFAULT_INT_HANDLER](#) (([osa_int_handler_t](#))(&[DefaultISR](#)))
The default interrupt handler installed in vector table.

Typedefs

- typedef uint32_t [event_flags_t](#)
Type for an event flags group, bit 32 is reserved.
- typedef void * [task_param_t](#)
Type for task parameter.
- typedef void(* [task_t](#))([task_param_t](#) param)
Type for a task pointer.
- typedef [task_control_block_t](#) * [task_handler_t](#)
Type for a task handler, returned by the `OSA_TaskCreate` function.

Bare Metal Abstraction Layer

- typedef uint32_t `task_stack_t`
Type for a task stack.
- typedef `msg_queue_t * msg_queue_handler_t`
Type for a message queue handler.

Functions

- void `DefaultISR` (void)
The default interrupt handler installed in vector table.

Thread management

- void `OSA_PollAllOtherTasks` (void)
Calls all task functions one time except for the current task.
- #define `OSA_TASK_DEFINE`(task, stackSize)
Defines a task.

Message queues

- #define `MSG_QUEUE_DECLARE`(name, number, size)
This macro statically reserves the memory required for the queue.

48.5.1.1 Bare Metal Abstraction Layer

Overview

When RTOSes are not used, bare metal abstraction layer provides semaphore, mutex, event, message queue, and so on. Because bare metal does not have a task scheduler, it is necessary to exercise caution while using bare metal abstraction layer.

Bare Metal Task Management

By contrast to RTOSes, bare metal abstraction layer uses a poll mechanism to simulate a task. All task functions are linked into a list and called one-by-one. Therefore, bare metal task function should not contain an infinite loop. It must return at a proper time to let the other tasks run.

Bare metal task does not support priority, all tasks use the same priority. The macro `TASK_MAX_NUM` defines how many tasks applications could create. If it is set to 0, then applications could not use task APIs.

Bare Metal's Wait Functions

Bare metal wait functions, such as `OSA_SemaWait` and `OSA_EventWait`, return the `kStatus_OSA_Idle` if wait condition is not met and timeout has not occurred. Applications should catch this value and take proper actions. If the wait condition is set by the ISR, applications could wait in a loop:

```
void post_ISR(void)
{
    //...
    OSA_SemaPost (&my_sem);
    //...
}

void wait_task(task_param_t param)
{
    //...
    do
    {
        status = OSA_SemaWait (&my_sem, 10);
    } while(kStatus_OSA_Idle == status);

    //...
}
```

In this example, if `my_sem` is not posted by the `post_ISR`, but posted by a task `post_task`, then `OSA_SemaWait` in loop could never get `my_sem` within the timeout because the `post_task` does not have a chance to post `my_sem`. In this situation, applications could be implemented as follows:

```
void post_task(task_param_t param)
{
    //...
    OSA_SemaPost (&my_sem);
    //...
}

void wait_task(task_param_t param)
{
    status = OSA_SemaWait (&my_sem, 10);

    switch (status)
    {
        case kStatus_OSA_Idle:
            return;
        case kStatus_OSA_Success:
            // ...
            break;
        case kStatus_OSA_Error:
            // ...
            break;
        case kStatus_OSA_Timeout:
            // ...
            break;
    }

    //...
}
```

Wait the semaphore at the start of the task, if `kStatus_OSA_Idle` is received. Return and let other tasks run. Then, `post_task` has a chance to post `my_sem`.

Bare Metal Abstraction Layer

The other method is using the function `OSA_PollAllOtherTasks()`. This function calls all other tasks one at a time and then `post_task` can post `my_sem`.

```
void post_task(task_param_t param)
{
    //...
    OSA_SemaPost (&my_sem);
    //...
}

void wait_task(task_param_t param)
{
    //...
    status = OSA_SemaWait (&my_sem, 10);

    while (kStatus_OSA_Idle == status)
    {
        OSA_PollAllOtherTasks();
        status = OSA_SemaWait (&my_sem, 10);
    }

    //...
}
```

The limitation of this method is that only one task can use the `OSA_PollAllOtherTasks()` function. If both `task_A` and `task_B` call this function, then the stack overflow may occur, because the call stack flows like this: `task_A -> OSA_PollAllOtherTasks -> task_B -> OSA_PollAllOtherTasks -> task_A -> ...`

Bare Metal Mutex

Bare metal OSA implements mutex as a binary semaphore, which is different than the RTOS mutex. Applications could choose whether to use it for the bare metal.

Bare Metal Time management

Bare metal OSA implements two configurations for the time management. The first one uses the low power timer. The second one is empty. In other words, this configuration disables time management in bare metal OSA. To use a different configuration, set the macro `FSL_OSA_BM_TIMER_CONFIG` in the file `fsl_os_abstraction_bm.h`.

Time management with LPTMR

To use the low power timer in bare metal OSA, define the `FSL_OSA_BM_TIMER_CONFIG` as the `FSL_OSA_BM_TIMER_LPTMR`.

Bare metal OSA maintains a system time with the low power timer module. Applications can get the system time in milliseconds using the function `OSA_TimeGetMsec()`. At the same time, all wait functions, such as `OSA_SemaWait()` and `OSA_EventWait()`, depend on the system time. Low power timer module is set up in the function `OSA_Init()`. To use this timer function, ensure that the `OSA_Init()` function is called.

Note that the low power timer provides only 16-bit time count and wraps every 65536 ms. Use these three functions:

1. `OSA_TimeDelay()` cannot delay longer than 65536 ms.
2. Wait functions, such as `OSA_SemaWait()`, cannot set timeout longer than 65536 ms, however, `OSA_WAIT_FOREVER` is allowed.
3. `OSA_TimeGetMsec()` wraps every 65536 ms; if it does not meet the requirement, use a different timer module in application.

Disable time management in bare metal OSA

To disable time management bare metal OSA, define the `FSL_OSA_BM_TIMER_CONFIG` as the `FSL_OSA_BM_TIMER_NONE`.

With this configuration, the LPTMR is not used by bare metal OSA and the footprint is smaller. Time services such `OSA_TimeGetMsec` and `OSA_TimeDelay` can't be used any more. At the same time, the wait functions such as `OSA_SemaWait()` and `OSA_EventWait()` can only use 0 or `OSA_WAIT_FOREVER` as the parameter timeout.

User-defined time management

When the LPTMR is occupied by other tasks and bare metal OSA is used to provide time services, bare metal OSA must use other timers for the time services. In this case, customizeS these functions defined in `fsl_os_abstraction_bm.c`:

```
/* Initializes timer.
void OSA_TimeInit(void);

/*
 * Gets the time delta between time_start and time_end. This function
 * should consider the timer counter overflow.

uint32_t OSA_TimeDiff(uint32_t time_start, uint32_t time_end);

/* Gets current time in milliseconds.
uint32_t OSA_TimeGetMsec(void);
```

There are two methods to customize these functions:

1. Modify the functions in `fsl_os_abstraction_bm.c` directly.
2. Define the functions in the application, which means that the functions in `fsl_os_abstraction_bm.c` are overridden.

Bare Metal Abstraction Layer

48.5.2 Data Structure Documentation

48.5.2.1 struct semaphore_t

Data Fields

- volatile bool [isWaiting](#)
Is any task waiting for a timeout on this object.
- volatile uint8_t [semCount](#)
The count value of the object.
- uint32_t [time_start](#)
The time to start timeout.
- uint32_t [timeout](#)
Timeout to wait in milliseconds.

48.5.2.2 struct mutex_t

Data Fields

- volatile bool [isWaiting](#)
Is any task waiting for a timeout on this mutex.
- volatile bool [isLocked](#)
Is the object locked or not.
- uint32_t [time_start](#)
The time to start timeout.
- uint32_t [timeout](#)
Timeout to wait in milliseconds.
- LWSEM_STRUCT [sema](#)
The lwsem structure.
- [_task_id](#) [owner](#)
Task who locks this mutex.

48.5.2.2.0.1 Field Documentation

48.5.2.2.0.1.1 LWSEM_STRUCT mutex_t::sema

48.5.2.2.0.1.2 [_task_id](#) mutex_t::owner

48.5.2.3 struct event_t

Data Fields

- volatile bool [isWaiting](#)
Is any task waiting for a timeout on this event.
- uint32_t [time_start](#)
The time to start timeout.
- uint32_t [timeout](#)
Timeout to wait in milliseconds.
- volatile [event_flags_t](#) [flags](#)

The flags status.

- [osa_event_clear_mode_t clearMode](#)

Auto clear or manual clear.

48.5.2.4 struct task_control_block_t

Data Fields

- [task_t p_func](#)
Task's entry.
- [task_param_t param](#)
Task's parameter.
- struct TaskControlBlock * [next](#)
Pointer to next task control block.
- struct TaskControlBlock * [prev](#)
Pointer to previous task control block.

48.5.2.5 struct msg_queue_t

Data Fields

- uint32_t * [queueMem](#)
Points to the queue memory.
- uint16_t [number](#)
The number of messages in the queue.
- uint16_t [size](#)
The size in words of each message.
- uint16_t [head](#)
Index of the next message to be read.
- uint16_t [tail](#)
Index of the next place to write to.
- [semaphore_t queueSem](#)
Semaphore wakeup tasks waiting for msg.
- volatile bool [isEmpty](#)
Whether queue is empty.

Bare Metal Abstraction Layer

48.5.3 Macro Definition Documentation

48.5.3.1 #define FSL_OSA_BM_TIMER_NONE 0U

48.5.3.2 #define FSL_OSA_BM_TIMER_LPTIMER 1U

48.5.3.3 #define FSL_OSA_BM_TIMER_CONFIG FSL_OSA_BM_TIMER_LPTIMER

48.5.3.4 #define OSA_WAIT_FOREVER 0xFFFFFFFFU

48.5.3.5 #define TASK_MAX_NUM 5

48.5.3.6 #define FSL_OSA_TIME_RANGE 0xFFFFU

48.5.3.7 #define OSA_DEFAULT_INT_HANDLER ((osa_int_handler_t)(&DefaultISR))

48.5.3.8 #define OSA_TASK_DEFINE(*task*, *stackSize*)

Value:

```
task_stack_t* task##_stack = NULL; \
task_handler_t task##_task_handler
```

This macro defines resources for a task statically. Then, the OSA_TaskCreate creates the task based-on these resources.

Parameters

| | |
|------------------|--|
| <i>task</i> | The task function. |
| <i>stackSize</i> | The stack size this task needs in bytes. |

48.5.3.9 #define MSG_QUEUE_DECLARE(*name*, *number*, *size*)

Value:

```
uint32_t queueMem_##name[number * size]; \
entity_##name = { \
    .queueMem = queueMem_##name \
}; \
*name = &(entity_##name)
```

Parameters

| | |
|---------------|-----------------------------------|
| <i>name</i> | Identifier for the memory region. |
| <i>number</i> | Number of elements in the queue. |
| <i>size</i> | Size of every element in words. |

48.5.4 Function Documentation

48.5.4.1 void DefaultISR (void)

48.5.4.2 void OSA_PollAllOtherTasks (void)

This function calls all other task functions one time. If current task is waiting for an event triggered by other tasks, this function could be used to trigger the event.

Note

There should be only one task calls this function, if more than one task call this function, stack overflow may occurs. Be careful to use this function.

FreeRTOS Abstraction Layer

48.6 FreeRTOS Abstraction Layer

The Kinetis SDK provides the FreeRTOS Abstraction Layer for synchronization, mutual exclusion, message queue, etc.

48.6.1 Overview

Data Structures

- struct `event_freertos`
Type for an event group object in FreeRTOS OS. [More...](#)

Macros

- #define `OSA_WAIT_FOREVER` `0xFFFFFFFFU`
Constant to pass as timeout value in order to wait indefinitely.
- #define `FSL_OSA_TIME_RANGE` `0xFFFFFFFFU`
OSA's time range in millisecond, OSA time wraps if exceeds this value.
- #define `OSA_DEFAULT_INT_HANDLER` `((osa_int_handler_t)&DefaultISR)`
The default interrupt handler installed in vector table.
- #define `OSA_MAX_ISR_CRITICAL_SECTION_DEPTH` `0x8U`
The Max depth of Enter/Exist Critical could be nested in interrupt.

Typedefs

- typedef `TaskHandle_t` `task_handler_t`
Type for a task handler, returned by the `OSA_TaskCreate` function.
- typedef `portSTACK_TYPE` `task_stack_t`
Type for a task stack.
- typedef `void *` `task_param_t`
Type for task parameter.
- typedef `pdTASK_CODE` `task_t`
Type for a task function.
- typedef `xSemaphoreHandle` `mutex_t`
Type for a mutex.
- typedef `xSemaphoreHandle` `semaphore_t`
Type for a semaphore.
- typedef `EventBits_t` `event_flags_t`
Type for an event flags object.
- typedef `event_freertos` `event_t`
Type for an event group object.
- typedef `xQueueHandle` `msg_queue_t`
Type for a message queue declaration and creation.
- typedef `xQueueHandle` `msg_queue_handler_t`
Type for a message queue handler.

Thread management

- #define `OSA_TASK_DEFINE(task, stackSize)`
Creates a task descriptor that is used to create the task with `OSA_TaskCreate`.
- #define `PRIORITY_OSA_TO_RTOS(osa_prio)` (`configMAX_PRIORITIES - (osa_prio) - 2`)
To provide unified task priority for upper layer, OSA layer makes conversion.
- #define `PRIORITY_RTOS_TO_OSA(rtos_prio)` (`configMAX_PRIORITIES - (rtos_prio) - 2`)

Message queues

- #define `MSG_QUEUE_DECLARE(name, number, size)` `msg_queue_t *name = NULL`
This macro statically reserves the memory required for the queue.

48.6.2 Data Structure Documentation

48.6.2.1 struct event_freertos

Data Fields

- EventGroupHandle_t `eventHandler`
FreeRTOS OS event handler.
- `osa_event_clear_mode_t` `clearMode`
Auto clear or manual clear.

48.6.3 Macro Definition Documentation

48.6.3.1 #define `OSA_WAIT_FOREVER 0xFFFFFFFFU`

48.6.3.2 #define `FSL_OSA_TIME_RANGE 0xFFFFFFFFU`

48.6.3.3 #define `OSA_DEFAULT_INT_HANDLER ((osa_int_handler_t)(&DefaultISR))`

48.6.3.4 #define `OSA_MAX_ISR_CRITICAL_SECTION_DEPTH 0x8U`

48.6.3.5 #define `OSA_TASK_DEFINE(task, stackSize)`

Value:

```
task_stack_t* task##_stack = NULL; \
task_handler_t task##_task_handler
```

FreeRTOS Abstraction Layer

Parameters

| | |
|------------------|--|
| <i>task</i> | The task function. |
| <i>stackSize</i> | Number of elements in the stack for this task. |

48.6.3.6 #define MSG_QUEUE_DECLARE(*name*, *number*, *size*) msg_queue_t *name = NULL

Parameters

| | |
|---------------|-----------------------------------|
| <i>name</i> | Identifier for the memory region. |
| <i>number</i> | Number of elements in the queue. |
| <i>size</i> | Size of every elements in words. |

48.6.4 Typedef Documentation

48.6.4.1 typedef TaskHandle_t task_handler_t

48.6.4.2 typedef portSTACK_TYPE task_stack_t

48.6.4.3 typedef pdTASK_CODE task_t

48.6.4.4 typedef xSemaphoreHandle mutex_t

48.6.4.5 typedef xSemaphoreHandle semaphore_t

48.6.4.6 typedef EventBits_t event_flags_t

48.6.4.7 typedef xQueueHandle msg_queue_t

48.7 MQX RTOS Abstraction Layer

The Kinetis SDK provides the MQX RTOS Abstraction Layer for synchronization, mutual exclusion, message queue, etc.

48.7.1 Overview

Data Structures

- struct [mutex_t](#)
Type for a mutex. [More...](#)

Macros

- #define [OSA_WAIT_FOREVER](#) 0xFFFFFFFFU
Constant to pass as timeout value in order to wait indefinitely.
- #define [FSL_OSA_TIME_RANGE](#) 0xFFFFFFFFU
OSA's time range in millisecond, OSA time wraps if exceeds this value.
- #define [OSA_DEFAULT_INT_HANDLER](#) ([OSA_DefaultIntHandler](#)())
The default interrupt handler installed in vector table.
- #define [MQX_MAIN_TASK_PRIORITY](#) (7+16)
The priority of MQX RTOS Main_Task.

Typedefs

- typedef LWSEM_STRUCT [semaphore_t](#)
Type for MQX RTOS mutex.
- typedef LWEVENT_STRUCT [event_t](#)
Type for an event group object.
- typedef _mqx_uint [event_flags_t](#)
Type for an event flags group, bit 32 is reserved.
- typedef TASK_FPTR [task_t](#)
Type for a task pointer.
- typedef _task_id [task_handler_t](#)
Type for a task handler, returned by the [OSA_TaskCreate](#) function.
- typedef uint32_t [task_param_t](#)
Type for a task handler, returned by the [task_create](#) function.
- typedef uint32_t [task_stack_t](#)
Type for a task stack.
- typedef _mqx_max_type [msg_queue_t](#)
Type for a message queue.
- typedef void * [msg_queue_handler_t](#)
Type for a message queue handler.

MQX RTOS Abstraction Layer

Functions

- static `osa_int_handler_t OSA_DefaultIntHandler` (void)
The default interrupt handler installed in vector table.

Thread management

- #define `OSA_TASK_DEFINE`(task, stackSize)
Defines a task.
- #define `PRIORITY_OSA_TO_RTOS`(osa_prio) ((osa_prio)+7U)
To provide unified task priority for upper layer, OSA layer makes a conversion.
- #define `PRIORITY_RTOS_TO_OSA`(rtos_prio) ((rtos_prio)-7U)

Message queues

- #define `SIZE_IN_MMT_UNITS`(size) ((size + sizeof(_mqx_max_type) - 1) / sizeof(_mqx_max_type))
- #define `MSG_QUEUE_DECLARE`(name, number, size) _mqx_max_type name[SIZE_IN_MMT_UNITS(sizeof(LWMSGQ_STRUCT)) + SIZE_IN_MMT_UNITS(size * 4) * number]
This macro statically reserves the memory required for the queue.

48.7.2 Data Structure Documentation

48.7.2.1 struct mutex_t

Data Fields

- volatile bool `isWaiting`
Is any task waiting for a timeout on this mutex.
- volatile bool `isLocked`
Is the object locked or not.
- uint32_t `time_start`
The time to start timeout.
- uint32_t `timeout`
Timeout to wait in milliseconds.
- LWSEM_STRUCT `sema`
The lwsem structure.
- _task_id `owner`
Task who locks this mutex.

48.7.2.1.0.2 Field Documentation

48.7.2.1.0.2.1 LWSEM_STRUCT mutex_t::sema

48.7.2.1.0.2.2 _task_id mutex_t::owner

48.7.3 Macro Definition Documentation

48.7.3.1 #define OSA_WAIT_FOREVER 0xFFFFFFFFU

48.7.3.2 #define FSL_OSA_TIME_RANGE 0xFFFFFFFFU

48.7.3.3 #define OSA_DEFAULT_INT_HANDLER (OSA_DefaultIntHandler())

48.7.3.4 #define MQX_MAIN_TASK_PRIORITY (7+16)

48.7.3.5 #define OSA_TASK_DEFINE(*task*, *stackSize*)

Value:

```
task_stack_t task##_stack[MQX_REQUIRED_STACK_SIZE(stackSize)/sizeof(
    task_stack_t)+1]; \
task_handler_t task##_task_handler;
```

This macro defines resources for a task statically. Then, the OSA_TaskCreate creates the task based-on these resources.

Parameters

| | |
|------------------|--|
| <i>task</i> | The task function. |
| <i>stackSize</i> | The stack size this task needs in bytes. |

48.7.3.6 #define PRIORITY_OSA_TO_RTOS(*osa_prio*) ((*osa_prio*)+7U)

MQX RTOS highest 7 priorities are special priorities.

48.7.3.7 #define MSG_QUEUE_DECLARE(*name*, *number*, *size*) _mqx-
_max_type name[SIZE_IN_MMT_UNITS(sizeof(LWMSGQ_STRUCT)) +
SIZE_IN_MMT_UNITS(*size* * 4) * *number*]

MQX RTOS Abstraction Layer

Parameters

| | |
|---------------|-----------------------------------|
| <i>name</i> | Identifier for the memory region. |
| <i>number</i> | Number of elements in the queue. |
| <i>size</i> | Size of element in 4 B units. |

48.7.4 Typedef Documentation

48.7.4.1 typedef LWSEM_STRUCT semaphore_t

Type for a semaphore.

48.7.4.2 typedef LWEVENT_STRUCT event_t

48.7.4.3 typedef _mqx_uint event_flags_t

48.7.4.4 typedef TASK_FPTR task_t

48.7.4.5 typedef _task_id task_handler_t

48.7.4.6 typedef uint32_t task_param_t

48.7.4.7 typedef uint32_t task_stack_t

48.7.4.8 typedef _mqx_max_type msg_queue_t

48.7.4.9 typedef void* msg_queue_handler_t

48.7.5 Function Documentation

48.7.5.1 static osa_int_handler_t OSA_DefaultIntHandler (void) [inline], [static]

Returns

Default ISR.

48.8 μC/OS-II Abstraction Layer

The Kinetis SDK provides the μC/OS-II Abstraction Layer for synchronization, mutual exclusion, message queue, etc.

48.8.1 Overview

Data Structures

- struct `event_ucosii`
Type for an event group object in μCOS-II. [More...](#)
- struct `msgq_ucosii`
Type for message queue in μCOS-II. [More...](#)

Macros

- #define `OSA_WAIT_FOREVER` `0xFFFFFFFFU`
Constant to pass as timeout value to wait indefinitely.
- #define `FSL_OSA_TIME_RANGE` `0xFFFFFFFFU`
OSA's time range in millisecond, OSA time wraps if exceeds this value.
- #define `OSA_DEFAULT_INT_HANDLER` `((osa_int_handler_t)&DefaultISR)`
The default interrupt handler installed in vector table.

Typedefs

- typedef `OS_FLAGS` `event_flags_t`
Type for an event flags group.
- typedef `OS_EVENT` * `semaphore_t`
Type for an semaphore.
- typedef `OS_EVENT` * `mutex_t`
Type for a mutex.
- typedef `event_ucosii` `event_t`
Type for an event group object.
- typedef `msgq_ucosii` `msg_queue_t`
Type for a message queue.
- typedef `msgq_ucosii` * `msg_queue_handler_t`
Type for a message queue handler.
- typedef `OS_TCB` * `task_handler_t`
Type for a task handler, returned by the `OSA_TaskCreate` function.
- typedef `OS_STK` `task_stack_t`
Type for a task stack.
- typedef `void` * `task_param_t`
Type for task parameter.
- typedef `void`(* `task_t`)(`task_param_t` param)
Type for a task pointer.

μC/OS-II Abstraction Layer

Thread management

- #define **OSA_TASK_DEFINE**(task, stackSize)
Defines a task.
- #define **PRIORITY_OSA_TO_RTOS**(osa_prio) ((osa_prio)+4U)
To provide unified task priority for upper layer, OSA layer makes conversion.
- #define **PRIORITY_RTOS_TO_OSA**(rtos_prio) ((rtos_prio)-4U)

Message queues

- #define **MSG_QUEUE_DECLARE**(name, number, size)
This macro statically reserves the memory required for the queue.

48.8.2 Data Structure Documentation

48.8.2.1 struct event_ucosii

Data Fields

- OS_FLAG_GRP * **pGroup**
Pointer to μCOS-II's event entity.
- **osa_event_clear_mode_t** clearMode
Auto clear or manual clear.

48.8.2.2 struct msgq_ucosii

Data Fields

- OS_EVENT * **pQueue**
Pointer to the queue.
- void ** **msgTbl**
Pointer to the array that saves the pointers to messages.
- OS_MEM * **pMem**
Pointer to memory where save the messages.
- void * **msgs**
Memory to save the messages.
- uint16_t **size**
Size of the message in words.

48.8.3 Macro Definition Documentation

48.8.3.1 #define OSA_WAIT_FOREVER 0xFFFFFFFFU

48.8.3.2 #define FSL_OSA_TIME_RANGE 0xFFFFFFFFU

48.8.3.3 #define OSA_DEFAULT_INT_HANDLER ((osa_int_handler_t)(&DefaultISR))

48.8.3.4 #define OSA_TASK_DEFINE(*task*, *stackSize*)

Value:

```
task_stack_t task##_stack[(stackSize)/sizeof(task_stack_t)];
    \
    task_handler_t task##_task_handler
```

This macro defines resources for a task statically. Then the OSA_TaskCreate creates the task based on these resources.

Parameters

| | |
|------------------|--|
| <i>task</i> | The task function. |
| <i>stackSize</i> | The stack size this task needs in bytes. |

48.8.3.5 #define MSG_QUEUE_DECLARE(*name*, *number*, *size*)

Value:

```
void* msgTbl_##name[number];
uint32_t msgs_##name[number*size];
msg_queue_t memory_##name = {
    .msgTbl = msgTbl_##name,
    .msgs = msgs_##name
};
msg_queue_t *name = &(memory_##name)
```

Parameters

| | |
|---------------|-----------------------------------|
| <i>name</i> | Identifier for the memory region. |
| <i>number</i> | Number of elements in the queue. |

μC/OS-II Abstraction Layer

| | |
|-------------|----------------------------------|
| <i>size</i> | Size of every elements in words. |
|-------------|----------------------------------|

48.9 μC/OS-III Abstraction Layer

The Kinetis SDK provides the μC/OS-III Abstraction Layer for synchronization, mutual exclusion, message queue, etc.

48.9.1 Overview

Data Structures

- struct `event_ucosiii`
Type for an event group object in μCOS-III. [More...](#)
- struct `msgq_struct_ucosiii`
Type for message queue in μCOS-III. [More...](#)

Macros

- #define `OSA_WAIT_FOREVER` `0xFFFFFFFFFU`
Constant to pass as timeout value in order to wait indefinitely.
- #define `FSL_OSA_TIME_RANGE` `0xFFFFFFFFFU`
OSA's time range in millisecond, OSA time wraps if exceeds this value.
- #define `OSA_DEFAULT_INT_HANDLER` `((osa_int_handler_t)&DefaultISR)`
The default interrupt handler installed in vector table.

Typedefs

- typedef `OS_TCB * task_handler_t`
Type for a task handler, returned by the `OSA_TaskCreate` function.
- typedef `CPU_STK task_stack_t`
Type for a task stack.
- typedef `void * task_param_t`
Type for task parameter.
- typedef `void(* task_t)(task_param_t param)`
Type for a task pointer.
- typedef `OS_SEM semaphore_t`
Type for a semaphore.
- typedef `OS_MUTEX mutex_t`
Type for a mutex.
- typedef `OS_FLAGS event_flags_t`
Type for an event flags group.
- typedef `event_ucosiii event_t`
Type for an event object.
- typedef `msgq_struct_ucosiii msg_queue_t`
Type for a message queue.
- typedef `msg_queue_t * msg_queue_handler_t`
Type for a message queue handler.

μC/OS-III Abstraction Layer

Thread management

- #define `OSA_TASK_DEFINE`(task, stackSize)
Defines a task.
- #define `PRIORITY_OSA_TO_RTOS`(osa_prio) ((osa_prio)+1U)
To provide unified task priority for upper layer, OSA layer makes conversion.
- #define `PRIORITY_RTOS_TO_OSA`(rtos_prio) ((rtos_prio)-1U)

Message queues

- #define `MSG_QUEUE_DECLARE`(name, number, size)
This macro statically reserves the memory required for the queue.

48.9.2 Data Structure Documentation

48.9.2.1 struct event_ucosiii

Data Fields

- `OS_FLAG_GRP` group
μCOS-III's event entity.
- `osa_event_clear_mode_t` clearMode
Auto clear or manual clear.

48.9.2.2 struct msgq_struct_ucosiii

Data Fields

- `OS_Q` queue
the message queue's control block
- `OS_MEM` mem
control block for the memory where save the messages
- void * `msgs`
pointer to the memory where save the messages
- uint16_t `size`
size of the message in words

48.9.3 Macro Definition Documentation

48.9.3.1 #define OSA_WAIT_FOREVER 0xFFFFFFFFU

48.9.3.2 #define FSL_OSA_TIME_RANGE 0xFFFFFFFFU

48.9.3.3 #define OSA_DEFAULT_INT_HANDLER ((osa_int_handler_t)(&DefaultISR))

48.9.3.4 #define OSA_TASK_DEFINE(*task*, *stackSize*)

Value:

```
OS_TCB TCB_##task;
    task_stack_t task##_stack[(stackSize)/sizeof(task_stack_t)];
    task_handler_t task##_task_handler = &(TCB_##task)
```

This macro defines resources for a task statically. Then, the OSA_TaskCreate creates the task based on these resources.

Parameters

| | |
|------------------|--|
| <i>task</i> | The task function. |
| <i>stackSize</i> | The stack size this task needs in bytes. |

48.9.3.5 #define PRIORITY_OSA_TO_RTOS(*osa_prio*) ((*osa_prio*)+1U)

uC/OS-III’s tick task should have a high priority, so we set tick task to priority 0, applications use other priorities.

48.9.3.6 #define MSG_QUEUE_DECLARE(*name*, *number*, *size*)

Value:

```
uint32_t msgs_##name[number*size];
    msg_queue_t memory_##name = {
        .msgs = msgs_##name
    };
    msg_queue_t *name = &(memory_##name)
```

μC/OS-III Abstraction Layer

Parameters

| | |
|---------------|-----------------------------------|
| <i>name</i> | Identifier for the memory region. |
| <i>number</i> | Number of elements in the queue. |
| <i>size</i> | Size of every elements in words. |

48.9.4 Typedef Documentation

48.9.4.1 typedef OS_TCB* task_handler_t

48.9.4.2 typedef CPU_STK task_stack_t

48.9.4.3 typedef OS_SEM semaphore_t

48.9.4.4 typedef OS_MUTEX mutex_t

48.9.4.5 typedef OS_FLAGS event_flags_t

48.9.4.6 typedef event_ucosiii event_t

48.9.4.7 typedef msgq_struct_ucosiii msg_queue_t

48.9.4.8 typedef msg_queue_t* msg_queue_handler_t

Chapter 49 Oscillator (OSC)

49.1 Overview

The Kinetis SDK provides a HAL driver for the Oscillator (OSC) block of Kinetis devices.

Modules

- [OSC HAL driver](#)

OSC HAL driver

49.2 OSC HAL driver

49.2.1 Overview

The chapter describes the programming interface of the OSC HAL driver. The OSC module is a crystal oscillator. The module and the external crystal or resonator generate a reference clock for the MCU.

The OSC HAL driver provides APIs to:

- Configure OSCERCLK.
- Configure the capacitor load.

49.2.2 OSCERCLK Configure APIs

To enable/disable OSCERCLK, use the functions [OSC_HAL_SetExternalRefClkCmd\(\)](#) and [OSC_HAL_SetExternalRefClkInStopModeCmd\(\)](#). These functions configure the OSCERCLK enabling or disabling in normal mode or stop mode.

The function [OSC_HAL_SetExternalRefClkDiv\(\)](#) configures the OSCERCLK divider.

49.2.3 Capacitor Load Configure APIs

To configure capacitor load, use the function [OSC_HAL_SetCapacitor](#) and pass the capacitor load as parameter. Example:

```
#include "fsl_osc_hal.h"

// To enable only 2 pF and 8 pF capacitor load, do this:
OSC_HAL_SetCapacitor(OSC, kOscCapacitor2p |
    kOscCapacitor8p);
```

Files

- file [fsl_osc_hal.h](#)

Enumerations

- enum [osc_capacitor_config_t](#) {
 - [kOscCapacitor2p](#) = OSC_CR_SC2P_MASK,
 - [kOscCapacitor4p](#) = OSC_CR_SC4P_MASK,
 - [kOscCapacitor8p](#) = OSC_CR_SC8P_MASK,
 - [kOscCapacitor16p](#) = OSC_CR_SC16P_MASK }

Oscillator capacitor load configurations.

oscillator control APIs

- static void [OSC_HAL_SetExternalRefClkCmd](#) (OSC_Type *base, bool enable)
Enables the external reference clock for the oscillator.
- static bool [OSC_HAL_GetExternalRefClkCmd](#) (OSC_Type *base)
Gets the external reference clock enable setting for the oscillator.
- static void [OSC_HAL_SetExternalRefClkInStopModeCmd](#) (OSC_Type *base, bool enable)
Enables/disables the external reference clock in stop mode.
- void [OSC_HAL_SetCapacitor](#) (OSC_Type *base, uint32_t bitMask)
Sets the capacitor configuration for the oscillator.

49.2.4 Enumeration Type Documentation

49.2.4.1 enum osc_capacitor_config_t

Enumerator

- kOscCapacitor2p* 2 pF capacitor load
- kOscCapacitor4p* 4 pF capacitor load
- kOscCapacitor8p* 8 pF capacitor load
- kOscCapacitor16p* 16 pF capacitor load

49.2.5 Function Documentation

49.2.5.1 static void OSC_HAL_SetExternalRefClkCmd (OSC_Type * *base*, bool *enable*) [inline], [static]

This function enables the external reference clock output for the oscillator, OSCERCLK. This clock is used by many peripherals. It should be enabled at an early system initialization stage to ensure the peripherals can select and use it.

Parameters

| | |
|---------------|----------------------------------|
| <i>base</i> | Oscillator register base address |
| <i>enable</i> | enable/disable the clock |

49.2.5.2 static bool OSC_HAL_GetExternalRefClkCmd (OSC_Type * *base*) [inline], [static]

This function gets the external reference clock output enable setting for the oscillator , OSCERCLK. This clock is used by many peripherals. It should be enabled at an early system initialization stage to ensure the peripherals could select and use it.

OSC HAL driver

Parameters

| | |
|-------------|----------------------------------|
| <i>base</i> | Oscillator register base address |
|-------------|----------------------------------|

Returns

Clock enable/disable setting

49.2.5.3 static void OSC_HAL_SetExternalRefClkInStopModeCmd (OSC_Type * *base*, bool *enable*) [inline], [static]

This function enables/disables the external reference clock (OSCERCLK) when an MCU enters the stop mode.

Parameters

| | |
|---------------|----------------------------------|
| <i>base</i> | Oscillator register base address |
| <i>enable</i> | enable/disable setting |

49.2.5.4 void OSC_HAL_SetCapacitor (OSC_Type * *base*, uint32_t *bitMask*)

This function sets the specified capacitors configuration for the oscillator. This should be done in the early system level initialization function call based on the system configuration.

Parameters

| | |
|----------------|---|
| <i>base</i> | Oscillator register base address |
| <i>bitMask</i> | Bit mask for the capacitor load option. |

Example:

```
// To enable only 2 pF and 8 pF capacitor load, please use like this.
OSC_HAL_SetCapacitor(OSC, kOscCapacitor2p |
    kOscCapacitor8p);
```

Chapter 50

PCC

50.1 Overview

The Kinetis SDK provides a HAL driver for the PCC block of Kinetis devices.

Modules

- [PCC HAL driver](#)

PCC HAL driver

50.2 PCC HAL driver

50.2.1 Overview

Enumerations

- enum `clock_ip_src_t` {
 - `kClockIpSrcNone` = 0U,
 - `kClockIpSrcSysOsc` = 1U,
 - `kClockIpSrcSIrc` = 2U,
 - `kClockIpSrcFIrc` = 3U,
 - `kClockIpSrcRtcOsc` = 4U,
 - `kClockIpSrcSysFll` = 5U,
 - `kClockIpSrcSysPll` = 6U,
 - `kClockIpSrcPerPll` = 7U,
 - `kClockIpSrcMax` = 8U }

Clock source for peripherals that support various clock selections.

Functions

- static void `CLOCK_HAL_EnableClock` (PCC_Type *base, uint8_t index)
 - Enables the clock for an IP module.*
- static void `CLOCK_HAL_DisableClock` (PCC_Type *base, uint8_t index)
 - Disables the clock for an IP module.*
- static bool `CLOCK_HAL_GetGateCmd` (PCC_Type *base, uint8_t index)
 - Gets the clock gate status on the current core for an IP module.*
- static bool `CLOCK_HAL_GetGateCmdOnOtherCore` (PCC_Type *base, uint8_t index)
 - Gets the clock gate status on other core for some IP module.*
- static void `CLOCK_HAL_SetIpSrc` (PCC_Type *base, uint8_t index, `clock_ip_src_t` src)
 - Sets the clock source for an IP module.*
- static `clock_ip_src_t` `CLOCK_HAL_GetIpSrc` (PCC_Type *base, uint8_t index)
 - Gets the clock source for an IP module.*
- static void `CLOCK_HAL_SetIpDiv` (PCC_Type *base, uint8_t index, uint32_t divider)
 - Sets the clock divider for an IP module.*
- static uint32_t `CLOCK_HAL_GetIpDiv` (PCC_Type *base, uint8_t index)
 - Gets the clock divider for an IP module.*

50.2.2 Enumeration Type Documentation

50.2.2.1 enum clock_ip_src_t

Enumerator

kClockIpSrcNone Clock is off or test clock is enabled.

kClockIpSrcSysOsc System Oscillator.

kClockIpSrcSIrc Slow IRC (maximum is 8 MHz).

- kClockIpSrcFirc* Fast IRC (maximum is 48 MHz).
- kClockIpSrcRtcOsc* RTC OSC.
- kClockIpSrcSysFll* System FLL DIV3 or DIV2.
- kClockIpSrcSysPll* System PLL DIV3 or DIV2.
- kClockIpSrcPerPll* Peripheral PLL DIV3 or DIV2.
- kClockIpSrcMax* Maximum value.

50.2.3 Function Documentation

50.2.3.1 static void CLOCK_HAL_EnableClock (PCC_Type * *base*, uint8_t *index*) [inline], [static]

This function enables the clock for a specific IP module. For example, to enable the DMA0 clock, use the function as follows:

```
CLOCK_HAL_EnableClock(PCC0_BASE, 8);
```

or use macro like this:

```
CLOCK_HAL_EnableClock(PCC0_BASE, PCC0_INDEX_DMA0);
```

Parameters

| | |
|--------------|--|
| <i>base</i> | Register base address for the PCC instance. |
| <i>index</i> | The control register index for the IP module in PCC. |

50.2.3.2 static void CLOCK_HAL_DisableClock (PCC_Type * *base*, uint8_t *index*) [inline], [static]

This function disables the clock for a specific IP module. For example, to disable the DMA0 clock, use the function as follows:

```
CLOCK_HAL_DisableClock(PCC0_BASE, 8);
```

or use macro like this:

```
CLOCK_HAL_DisableClock(PCC0_BASE, PCC0_INDEX_DMA0);
```

PCC HAL driver

Parameters

| | |
|--------------|--|
| <i>base</i> | Register base address for the PCC instance. |
| <i>index</i> | The control register index for the IP module in PCC. |

50.2.3.3 `static bool CLOCK_HAL_GetGateCmd (PCC_Type * base, uint8_t index)` `[inline], [static]`

This function gets the clock gate status on the current core for an IP module. For example, to get the DMA0 clock gate status, use the function as follows:

```
CLOCK_HAL_GetGateCmd(PCC0_BASE, 8);
```

or use macro like this:

```
CLOCK_HAL_GetGateCmd(PCC0_BASE, PCC0_INDEX_DMA0);
```

Parameters

| | |
|--------------|--|
| <i>base</i> | Register base address for the PCC instance. |
| <i>index</i> | The control register index for the IP module in PCC. |

Returns

state true - ungated(Enabled), false - gated (Disabled)

50.2.3.4 `static bool CLOCK_HAL_GetGateCmdOnOtherCore (PCC_Type * base, uint8_t index)` `[inline], [static]`

This function gets the clock gate status on other core for some IP module. For example, to get the DMA0 clock gate status, use like this:

```
CLOCK_HAL_GetGateCmdOnOtherCore(PCC0_BASE, 8);
```

or use macro like this:

```
CLOCK_HAL_GetGateCmdOnOtherCore(PCC0_BASE, PCC0_INDEX_DMA0);
```

Parameters

| | |
|--------------|--|
| <i>base</i> | Register base address for the PCC instance. |
| <i>index</i> | The control register index for the IP module in PCC. |

Returns

state true - ungated(Enabled), false - gated (Disabled)

50.2.3.5 static void CLOCK_HAL_SetIpSrc (PCC_Type * *base*, uint8_t *index*, clock_ip_src_t *src*) [inline], [static]

This function sets the clock source for an IP module. For example, to set the clock source for USBFS0 to OSCCLK, use the function as follows:

```
CLOCK_HAL_SetIpSrc(PCC0_BASE, 38, kClockIpSrcSysOsc);
```

or use macro like this:

```
CLOCK_HAL_SetIpSrc(PCC0_BASE, PCC0_INDEX_USBFS0, kClockIpSrcSysOsc);
```

Parameters

| | |
|--------------|--|
| <i>base</i> | Register base address for the PCC instance. |
| <i>index</i> | The control register index for the IP module in PCC. |
| <i>src</i> | The clock source to set. |

Note

Not all peripherals support various clock sources. See the reference manual for more details.

50.2.3.6 static clock_ip_src_t CLOCK_HAL_GetIpSrc (PCC_Type * *base*, uint8_t *index*) [inline], [static]

This function gets the clock source for an IP module. For example, to get the clock source for USBFS0 to OSCCLK, use the function as follows:

```
CLOCK_HAL_GetIpSrc(PCC0_BASE, 38);
```

or use macro like this:

```
CLOCK_HAL_GetIpSrc(PCC0_BASE, PCC0_INDEX_USBFS0);
```

PCC HAL driver

Parameters

| | |
|--------------|--|
| <i>base</i> | Register base address for the PCC instance. |
| <i>index</i> | The control register index for the IP module in PCC. |

Returns

Current clock source for this module.

Note

Not all peripherals support various clock sources. See the reference manual for more details.

50.2.3.7 **static void CLOCK_HAL_SetIpDiv (PCC_Type * *base*, uint8_t *index*, uint32_t *divider*) [inline], [static]**

This function sets the clock divider for an IP module.

Parameters

| | |
|----------------|--|
| <i>base</i> | Register base address for the PCC instance. |
| <i>index</i> | The control register index for the IP module in PCC. |
| <i>divider</i> | Clock divider for this module. |

Note

Not all peripherals support this feature. See the reference manual for more details.

50.2.3.8 **static uint32_t CLOCK_HAL_GetIpDiv (PCC_Type * *base*, uint8_t *index*) [inline], [static]**

This function gets the clock divider for an IP module.

Parameters

| | |
|-------------|---|
| <i>base</i> | Register base address for the PCC instance. |
|-------------|---|

| | |
|--------------|--|
| <i>index</i> | The control register index for the IP module in PCC. |
|--------------|--|

Returns

Current clock divider for this module.

Note

Not all peripherals support this feature. See the reference manual for more details.

Chapter 51

Programmable Delay Block (PDB)

51.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Programmable Delay Block (PDB) block of Kinetis devices.

Modules

- [PDB HAL driver](#)
- [PDB Peripheral driver](#)

PDB HAL driver

51.2 PDB HAL driver

51.2.1 Overview

This section describes the programming interface of the PDB HAL driver.

Data Structures

- struct `pdb_timer_config_t`
Defines the type of structure for basic timer in PDB. [More...](#)

Enumerations

- enum `pdb_status_t` {
`kStatus_PDB_Success` = 0U,
`kStatus_PDB_InvalidArgument` = 1U,
`kStatus_PDB_Failed` = 2U }
PDB status return codes.
- enum `pdb_load_value_mode_t` {
`kPdbLoadValueImmediately` = 0U,
`kPdbLoadValueAtModuloCounter` = 1U,
`kPdbLoadValueAtNextTrigger` = 2U,
`kPdbLoadValueAtModuloCounterOrNextTrigger` = 3U }
Defines the type of value load mode for the PDB module.
- enum `pdb_clk_prescaler_div_t` {
`kPdbClkPreDivBy1` = 0U,
`kPdbClkPreDivBy2` = 1U,
`kPdbClkPreDivBy4` = 2U,
`kPdbClkPreDivBy8` = 3U,
`kPdbClkPreDivBy16` = 4U,
`kPdbClkPreDivBy32` = 5U,
`kPdbClkPreDivBy64` = 6U,
`kPdbClkPreDivBy128` = 7U }
Defines the type of prescaler divider for the PDB counter clock.
- enum `pdb_trigger_src_t` {

```

kPdbTrigger0 = 0U,
kPdbTrigger1 = 1U,
kPdbTrigger2 = 2U,
kPdbTrigger3 = 3U,
kPdbTrigger4 = 4U,
kPdbTrigger5 = 5U,
kPdbTrigger6 = 6U,
kPdbTrigger7 = 7U,
kPdbTrigger8 = 8U,
kPdbTrigger9 = 9U,
kPdbTrigger10 = 10U,
kPdbTrigger11 = 11U,
kPdbTrigger12 = 12U,
kPdbTrigger13 = 13U,
kPdbTrigger14 = 14U,
kPdbSoftTrigger = 15U }

```

Defines the type of trigger source mode for the PDB.

- enum `pdb_clk_prescaler_mult_factor_t` {

```

kPdbClkPreMultFactorAs1 = 0U,
kPdbClkPreMultFactorAs10 = 1U,
kPdbClkPreMultFactorAs20 = 2U,
kPdbClkPreMultFactorAs40 = 3U }

```

Defines the type of the multiplication source mode for PDB.

Functions

- void `PDB_HAL_Init` (PDB_Type *base)

Resets the PDB registers to a known state.
- `pdb_status_t PDB_HAL_ConfigTimer` (PDB_Type *base, const `pdb_timer_config_t` *configPtr)

Configures the PDB timer.
- static void `PDB_HAL_SetSoftTriggerCmd` (PDB_Type *base)

Triggers the DAC by software if enabled.
- static void `PDB_HAL_Enable` (PDB_Type *base)

Switches on to enable the PDB module.
- static void `PDB_HAL_Disable` (PDB_Type *base)

Switches to disable the PDB module.
- static bool `PDB_HAL_GetTimerIntFlag` (PDB_Type *base)

Gets the PDB delay interrupt flag.
- static void `PDB_HAL_ClearTimerIntFlag` (PDB_Type *base)

Clears the PDB delay interrupt flag.
- static void `PDB_HAL_SetLoadValuesCmd` (PDB_Type *base)

Loads the delay registers value for the PDB module.
- static void `PDB_HAL_SetTimerModulusValue` (PDB_Type *base, uint32_t value)

Sets the modulus value for the PDB module.
- static uint32_t `PDB_HAL_GetTimerValue` (PDB_Type *base)

Gets the PDB counter value of PDB timer.
- static void `PDB_HAL_SetValueForTimerInterrupt` (PDB_Type *base, uint32_t value)

PDB HAL driver

- Sets the interrupt delay milestone of the PDB counter.*

 - void [PDB_HAL_SetAdcPreTriggerBackToBackEnable](#) (PDB_Type *base, uint32_t chn, uint32_t preChnMask, bool enable)
- Switches to enable the pre-trigger back-to-back mode.*

 - void [PDB_HAL_SetAdcPreTriggerOutputEnable](#) (PDB_Type *base, uint32_t chn, uint32_t preChnMask, bool enable)
- Switches to enable the pre-trigger output.*

 - void [PDB_HAL_SetAdcPreTriggerEnable](#) (PDB_Type *base, uint32_t chn, uint32_t preChnMask, bool enable)
- Switches to enable the pre-trigger.*

 - static uint32_t [PDB_HAL_GetAdcPreTriggerFlags](#) (PDB_Type *base, uint32_t chn, uint32_t preChnMask)
- Gets the flag which indicates whether the PDB counter has reached the pre-trigger delay value.*

 - void [PDB_HAL_ClearAdcPreTriggerFlags](#) (PDB_Type *base, uint32_t chn, uint32_t preChnMask)
- Clears the flag which indicates that the PDB counter has reached the pre-trigger delay value.*

 - static uint32_t [PDB_HAL_GetAdcPreTriggerSeqErrFlags](#) (PDB_Type *base, uint32_t chn, uint32_t preChnMask)
- Gets the flag which indicates whether a sequence error is detected.*

 - void [PDB_HAL_ClearAdcPreTriggerSeqErrFlags](#) (PDB_Type *base, uint32_t chn, uint32_t preChnMask)
- Clears the flag which indicates that a sequence error has been detected.*

 - void [PDB_HAL_SetAdcPreTriggerDelayValue](#) (PDB_Type *base, uint32_t chn, uint32_t preChn, uint32_t value)
- Sets the pre-trigger delay value.*

 - void [PDB_HAL_SetCmpPulseOutEnable](#) (PDB_Type *base, uint32_t pulseChnMask, bool enable)
- Switches to enable the pulse-out trigger.*

 - static void [PDB_HAL_SetCmpPulseOutDelayForHigh](#) (PDB_Type *base, uint32_t pulseChn, uint32_t value)
- Sets the counter delay value for the pulse-out goes high.*

 - static void [PDB_HAL_SetCmpPulseOutDelayForLow](#) (PDB_Type *base, uint32_t pulseChn, uint32_t value)
- Sets the counter delay value for the pulse-out goes low.*

51.2.2 Data Structure Documentation

51.2.2.1 struct pdb_timer_config_t

Data Fields

- [pdb_load_value_mode_t loadValueMode](#)
Select the load mode.
- bool [seqErrIntEnable](#)
Enable PDB Sequence Error Interrupt.
- [pdb_clk_prescaler_div_t clkPreDiv](#)
Select the prescaler divider.
- [pdb_clk_prescaler_mult_factor_t clkPreMultFactor](#)
Select multiplication factor for prescaler.
- [pdb_trigger_src_t triggerInput](#)

- *Select the trigger input source.*
bool `continuousModeEnable`
- *Enable the continuous mode.*
bool `dmaEnable`
- *Enable the dma for timer.*
bool `intEnable`
- *Enable the interrupt for timer.*

51.2.3 Enumeration Type Documentation

51.2.3.1 enum `pdb_status_t`

Enumerator

- `kStatus_PDB_Success`* Success.
- `kStatus_PDB_InvalidArgument`* Invalid argument existed.
- `kStatus_PDB_Failed`* Execution failed.

51.2.3.2 enum `pdb_load_value_mode_t`

Some timing related registers, such as the MOD, IDLY, CHnDLYm, INTx and POyDLY, buffer the setting values. Only the load operation is triggered. The setting value is loaded from a buffer and takes effect. There are four loading modes to fit different applications.

Enumerator

- `kPdbLoadValueImmediately`* Loaded immediately after load operation.
- `kPdbLoadValueAtModuloCounter`* Loaded when counter hits the modulo after load operation.
- `kPdbLoadValueAtNextTrigger`* Loaded when detecting an input trigger after load operation.
- `kPdbLoadValueAtModuloCounterOrNextTrigger`* Loaded when counter hits the modulo or detecting an input trigger after load operation.

51.2.3.3 enum `pdb_clk_prescaler_div_t`

Enumerator

- `kPdbClkPreDivBy1`* Counting divided by multiplication factor selected by MULT.
- `kPdbClkPreDivBy2`* Counting divided by multiplication factor selected by 2 times of MULT.
- `kPdbClkPreDivBy4`* Counting divided by multiplication factor selected by 4 times of MULT.
- `kPdbClkPreDivBy8`* Counting divided by multiplication factor selected by 8 times of MULT.
- `kPdbClkPreDivBy16`* Counting divided by multiplication factor selected by 16 times of MULT.
- `kPdbClkPreDivBy32`* Counting divided by multiplication factor selected by 32 times of MULT.
- `kPdbClkPreDivBy64`* Counting divided by multiplication factor selected by 64 times of MULT.
- `kPdbClkPreDivBy128`* Counting divided by multiplication factor selected by 128 times of MULT.

PDB HAL driver

51.2.3.4 enum pdb_trigger_src_t

Selects the trigger input source for the PDB. The trigger input source can be internal or external (EXTRG pin), or the software trigger.

Enumerator

- kPdbTrigger0* Select trigger-In 0.
- kPdbTrigger1* Select trigger-In 1.
- kPdbTrigger2* Select trigger-In 2.
- kPdbTrigger3* Select trigger-In 3.
- kPdbTrigger4* Select trigger-In 4.
- kPdbTrigger5* Select trigger-In 5.
- kPdbTrigger6* Select trigger-In 6.
- kPdbTrigger7* Select trigger-In 7.
- kPdbTrigger8* Select trigger-In 8.
- kPdbTrigger9* Select trigger-In 8.
- kPdbTrigger10* Select trigger-In 10.
- kPdbTrigger11* Select trigger-In 11.
- kPdbTrigger12* Select trigger-In 12.
- kPdbTrigger13* Select trigger-In 13.
- kPdbTrigger14* Select trigger-In 14.
- kPdbSoftTrigger* Select software trigger.

51.2.3.5 enum pdb_clk_prescaler_mult_factor_t

Selects the multiplication factor of the prescaler divider for the PDB counter clock.

Enumerator

- kPdbClkPreMultFactorAs1* Multiplication factor is 1.
- kPdbClkPreMultFactorAs10* Multiplication factor is 10.
- kPdbClkPreMultFactorAs20* Multiplication factor is 20.
- kPdbClkPreMultFactorAs40* Multiplication factor is 40.

51.2.4 Function Documentation

51.2.4.1 void PDB_HAL_Init (PDB_Type * base)

This function resets the PDB registers to a known state. This state is defined in a reference manual and is power-on-reset value.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

51.2.4.2 `pdb_status_t PDB_HAL_ConfigTimer (PDB_Type * base, const pdb_timer_config_t * configPtr)`

This function configures the PDB basic timer.

Parameters

| | |
|------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>configPtr</i> | Pointer to configuration structure, see to " <code>pdb_timer_config_t</code> ". |

Returns

Execution status.

51.2.4.3 `static void PDB_HAL_SetSoftTriggerCmd (PDB_Type * base) [inline], [static]`

If enabled, this function triggers the DAC by using software.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

51.2.4.4 `static void PDB_HAL_Enable (PDB_Type * base) [inline], [static]`

This function switches on to enable the PDB module.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

51.2.4.5 `static void PDB_HAL_Disable (PDB_Type * base) [inline], [static]`

This function switches to disable the PDB module.

PDB HAL driver

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

51.2.4.6 static bool PDB_HAL_GetTimerIntFlag (PDB_Type * *base*) [inline], [static]

This function gets the PDB delay interrupt flag.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

Returns

Flat status, true if the flag is set.

51.2.4.7 static void PDB_HAL_ClearTimerIntFlag (PDB_Type * *base*) [inline], [static]

This function clears the PDB delay interrupt flag.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

Returns

Flat status, true if the flag is set.

51.2.4.8 static void PDB_HAL_SetLoadValuesCmd (PDB_Type * *base*) [inline], [static]

This function sets the LDOK bit and loads the delay registers value. Writing one to this bit updates the internal registers MOD, IDLY, CHnDLYm, DACINTx, and POyDLY with the values written to their buffers. The MOD, IDLY, CHnDLYm, DACINTx, and POyDLY take effect according to the load mode settings.

After one is written to the LDOK bit, the values in the buffers of the above mentioned registers are not effective and cannot be written until the values in the buffers are loaded into their internal registers. The LDOK can be written only when the the PDB is enabled or as alone with it. It is automatically cleared either when the values in the buffers are loaded into the internal registers or when the PDB is disabled.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

51.2.4.9 static void PDB_HAL_SetTimerModulusValue (PDB_Type * *base*, uint32_t *value*) [inline], [static]

This function sets the modulus value for the PDB module. When the counter reaches the setting value, it is automatically reset to zero. When in continuous mode, the counter begins to increase again.

Parameters

| | |
|--------------|---|
| <i>base</i> | Register base address for the module. |
| <i>value</i> | The setting value of upper limit for PDB counter. |

51.2.4.10 static uint32_t PDB_HAL_GetTimerValue (PDB_Type * *base*) [inline], [static]

This function gets the PDB counter value of PDB timer.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

Returns

The current counter value.

51.2.4.11 static void PDB_HAL_SetValueForTimerInterrupt (PDB_Type * *base*, uint32_t *value*) [inline], [static]

This function sets the interrupt delay milestone of the PDB counter. If enabled, a PDB interrupt is generated when the counter is equal to the setting value.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

PDB HAL driver

| | |
|--------------|---|
| <i>value</i> | The setting value for interrupt delay milestone of PDB counter. |
|--------------|---|

51.2.4.12 void PDB_HAL_SetAdcPreTriggerBackToBackEnable (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChnMask*, bool *enable*)

This function switches to enable the pre-trigger back-to-back mode.

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChnMask</i> | ADC channel group index mask for trigger. |
| <i>enable</i> | Switcher to assert the feature. |

51.2.4.13 void PDB_HAL_SetAdcPreTriggerOutputEnable (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChnMask*, bool *enable*)

This function switches to enable pre-trigger output.

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChnMask</i> | ADC channel group index mask for trigger. |
| <i>enable</i> | Switcher to assert the feature. |

51.2.4.14 void PDB_HAL_SetAdcPreTriggerEnable (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChnMask*, bool *enable*)

This function switches to enable the pre-trigger.

Parameters

| | |
|-------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
|-------------|---------------------------------------|

| | |
|-------------------|---|
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChnMask</i> | ADC channel group index mask for trigger. |
| <i>enable</i> | Switcher to assert the feature. |

51.2.4.15 static uint32_t PDB_HAL_GetAdcPreTriggerFlags (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChnMask*) [inline], [static]

This function gets the flag which indicates the PDB counter has reached the pre-trigger delay value.

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChnMask</i> | ADC channel group index mask for trigger. |

Returns

Flag mask. Indicated bit would be 1 if the event is asserted.

51.2.4.16 void PDB_HAL_ClearAdcPreTriggerFlags (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChnMask*)

This function clears the flag which indicates that the PDB counter has reached the pre-trigger delay value.

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChnMask</i> | ADC channel group index mask for trigger. |

51.2.4.17 static uint32_t PDB_HAL_GetAdcPreTriggerSeqErrFlags (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChnMask*) [inline], [static]

This function gets the flag which indicates whether a sequence error is detected.

PDB HAL driver

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChnMask</i> | ADC channel group index mask for trigger. |

Returns

Flag mask. Indicated bit would be 1 if the event is asserted.

51.2.4.18 void PDB_HAL_ClearAdcPreTriggerSeqErrFlags (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChnMask*)

This function clears the flag which indicates that the sequence error has been detected.

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChnMask</i> | ADC channel group index mask for trigger. |

51.2.4.19 void PDB_HAL_SetAdcPreTriggerDelayValue (PDB_Type * *base*, uint32_t *chn*, uint32_t *preChn*, uint32_t *value*)

This function sets the pre-trigger delay value.

Parameters

| | |
|---------------|--|
| <i>base</i> | Register base address for the module. |
| <i>chn</i> | ADC instance index for trigger. |
| <i>preChn</i> | ADC channel group index for trigger. |
| <i>value</i> | Setting value for pre-trigger's delay value. |

51.2.4.20 void PDB_HAL_SetCmpPulseOutEnable (PDB_Type * *base*, uint32_t *pulseChnMask*, bool *enable*)

This function switches to enable the pulse-out trigger.

Parameters

| | |
|---------------------|---|
| <i>base</i> | Register base address for the module. |
| <i>pulseChnMask</i> | Pulse-out channel index mask for trigger. |
| <i>enable</i> | Switcher to assert the feature. |

51.2.4.21 static void PDB_HAL_SetCmpPulseOutDelayForHigh (PDB_Type * *base*, uint32_t *pulseChn*, uint32_t *value*) [inline], [static]

This function sets the counter delay value for the pulse-out goes high.

Parameters

| | |
|-----------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
| <i>pulseChn</i> | Pulse-out channel index for trigger. |
| <i>value</i> | Setting value for PDB delay . |

51.2.4.22 static void PDB_HAL_SetCmpPulseOutDelayForLow (PDB_Type * *base*, uint32_t *pulseChn*, uint32_t *value*) [inline], [static]

This function sets the counter delay value for the pulse-out goes low.

Parameters

| | |
|-----------------|---------------------------------------|
| <i>base</i> | Register base address for the module. |
| <i>pulseChn</i> | Pulse-out channel index for trigger. |
| <i>value</i> | Setting value for PDB delay . |

PDB Peripheral driver

51.3 PDB Peripheral driver

51.3.1 Overview

This section describes the programming interface of the PDB Peripheral driver. The PDB peripheral driver configures the PDB (Programmable Delay Block). It handles the triggers for ADC and DAC and pulse out to the CMP and the PDB counter.

51.3.2 PDB Driver model building

There is one main PDB counter for all triggers. When the indicated external trigger input arrives, the PDB counter launches and is increased by setting clock. The counter trigger milestones for ADC and DAC pulse out to the CMP and the PDB counter and wait for the PDB counter. Once the PDB counter hits each milestone, also called the critical delay value, the corresponding event is triggered and the trigger signal is sent out to trigger other peripherals. Therefore, the PDB module is a collector and manager of triggers.

51.3.3 PDB Initialization

The core feature of the PDB module is a programmable timer/counter. Additional features enable and set the milestone for the corresponding trigger. Therefore, the PDB module is first initialized as a programmable timer. To initialize the PDB driver, a configuration structure of the of "pdb_user_config_t" type is required and should store an available configuration. The API of the PDB_DRV_StructInitUserConfigForSoftTrigger() function provides a configuration which the PDB can use. However, this configuration is not sufficient for user-specific use cases. The user should provide a configuration suitable for the application requirements. Call the API of [PDB_DRV_Init\(\)](#) function to initialize the PDB timer/counter.

All triggers share the same counter. However, the DAC trigger does not share the same counting circle with other triggers. When the DAC's internal circle ends, the trigger is generated and the internal circle restarts.

The basic timing/counting step is set when initializing the main PDB counter:

The basic timing/counting step = $F_BusClkHz / \text{pdb_timer_config_t.clkPreDiv} / \text{pdb_timer_config_t.clkPreMultFactor}$

The $F_BusClkHz$ is the frequency of bus clock in Hertz. The "clkPreDiv" and "clkPreMultFactor" are in the [pdb_timer_config_t](#) structure. All triggering milestones are based on this step.

51.3.4 PDB Call diagram

Four kinds of typical use cases are designed for the PDB module.

- Normal Timer/Counter. Normal Timer/Counter is the basic case. The Timer/Counter starts after the PDB is initialized and the milestone for the PDB Timer/Counter is set. After it is triggered and when

the counter hits the milestone, the interrupt request occurs if enabled. In continuous mode, when the counter hits the upper limit, it returns zero and counts again.

- Trigger for ADC module. When the ADC trigger is enabled, a delay value for ADC trigger is set as the milestone. At least two ADC channel groups are provided. Likewise, there are more than two pre-triggers for ADC. Each pre-trigger is related to one channel group and can be enabled separately in the PDB module. When the PDB counter hits the milestone for the ADC pre-trigger, it triggers the ADC's conversion on the indicated channel group. To maximize the feature, the ADC should be configured to enable the hardware trigger mode.
- Trigger for the DAC module. A standalone DAC counter exists in the PDB module to trigger the DAC module. The user can set the upper limit for the DAC counter. Once the counter reaches the upper limit, it turns the DAC counter to zero and counts again. When the DAC counter hits the upper limit, a DAC trigger is generated to trigger the DAC. This trigger updates the pointer of the DAC buffer. Although the DAC counter has its own setting for the upper limit, it shares the same input trigger source, clock source, and reset control logic with the main PDB counter. When the PDB counter resets to zero, it forces the DAC counter to reset to zero. To maximize this feature, the DAC should be configured to enable the DAC buffer and hardware trigger mode.
- Trigger for pulse out to the CMP module. The pulse-out trigger is attached to the main PDB counter. There are two milestones for each pulse out channel, a milestone for level high and for level low, which makes a sample window for the CMP module.

These are the examples to initialize and configure the PDB driver for typical use cases.

Normal Timer/Counter:

```
// pdb_test_normal_timer.c //
#include "pdb_test.h"

static volatile uint32_t gPdbIntCounter = 0U;
static volatile uint32_t gPdbInstance = 0U;

static void PDB_ISR_Counter(void);

void PDB_TEST_NormalTimer(uint32_t instance)
{
    pdb_timer_config_t PdbTimerConfig;

    PdbTimerConfig.loadValueMode = kPdbLoadValueImmediately;
    PdbTimerConfig.seqErrIntEnable = false;
    PdbTimerConfig.clkPreDiv = kPdbClkPreDivBy8;
    PdbTimerConfig.clkPreMultFactor = kPdbClkPreMultFactorAs40;
    PdbTimerConfig.triggerInput = kPdbSoftTrigger;
    PdbTimerConfig.continuousModeEnable = true;
    PdbTimerConfig.dmaEnable = false;
    PdbTimerConfig.intEnable = true;
    PDB_DRV_Init(instance, &PdbTimerConfig);

    PDB_DRV_SetTimerModulusValue(instance, 0xFFFFU);
    PDB_DRV_SetValueForTimerInterrupt(instance, 0xFFU);
    PDB_DRV_LoadValuesCmd(instance);
    gPdbIntCounter = 0U;

    gPdbInstance = instance;
    PDB_TEST_InstallCallback(instance, PDB_ISR_Counter);

    PDB_DRV_SoftTriggerCmd(instance);
    while (gPdbIntCounter < 20U) {}
    PRINTF("PDB Timer's delay interrupt generated.\r\n");
}
```

PDB Peripheral driver

```

PDB_DRV_Deinit(instance);

PRINTF("OK.\r\n");
}

static void PDB_ISR_Counter(void)
{
    if (gPdbIntCounter >= 0xFFFFU)
    {
        gPdbIntCounter = 0U;
    }
    else
    {
        gPdbIntCounter++;
    }
}

```

Trigger for ADC module:

```

#include "pdb_test.h"

// pdb_test_adc_trigger.c //

void PDB_TEST_AdcPreTrigger(uint32_t instance)
{
    pdb_timer_config_t PdbTimerConfig;
    pdb_adc_pretrigger_config_t PdbAdcPreTriggerConfig;

    PdbTimerConfig.loadValueMode = kPdbLoadValueImmediately;
    PdbTimerConfig.seqErrIntEnable = false;
    PdbTimerConfig.clkPreDiv = kPdbClkPreDivBy8;
    PdbTimerConfig.clkPreMultFactor = kPdbClkPreMultFactorAs40;
    PdbTimerConfig.triggerInput = kPdbSoftTrigger;
    PdbTimerConfig.continuousModeEnable = false;
    PdbTimerConfig.dmaEnable = false;
    PdbTimerConfig.intEnable = false;
    PDB_DRV_Init(instance, &PdbTimerConfig);

    PdbAdcPreTriggerConfig.adcPreTriggerIdx = 0U;
    PdbAdcPreTriggerConfig.preTriggerEnable = true;
    PdbAdcPreTriggerConfig.preTriggerOutputEnable = true;
    PdbAdcPreTriggerConfig.preTriggerBackToBackEnable = false;
    PDB_DRV_ConfigAdcPreTrigger(instance, 0U, &PdbAdcPreTriggerConfig);

    PDB_DRV_SetTimerModulusValue(instance, 0xFFFFU);
    PDB_DRV_SetAdcPreTriggerDelayValue(instance, 0U, 0U, 0xFFFFU);
    PDB_DRV_LoadValuesCmd(instance);

    PDB_DRV_SoftTriggerCmd(instance);
    while (1U != PDB_DRV_GetAdcPreTriggerFlags(instance, 0U, 1U)) {}
    PDB_DRV_ClearAdcPreTriggerFlags(instance, 0U, 1U);
    PRINTF("PDB ADC PreTrigger generated.\r\n");

    PDB_DRV_Deinit(instance);

    PRINTF("OK.\r\n");
}

```

Data Structures

- struct `pdb_adc_pretrigger_config_t`
Defines the type of structure for configuring ADC's pre_trigger. [More...](#)

Functions

- [pdb_status_t PDB_DRV_Init](#) (uint32_t instance, const [pdb_timer_config_t](#) *userConfigPtr)
Initializes the PDB counter and triggers input.
- [pdb_status_t PDB_DRV_Deinit](#) (uint32_t instance)
Deinitializes the PDB module.
- void [PDB_DRV_SoftTriggerCmd](#) (uint32_t instance)
Triggers the PDB with a software trigger.
- uint32_t [PDB_DRV_GetTimerValue](#) (uint32_t instance)
Gets the current counter value in the PDB module.
- bool [PDB_DRV_GetTimerIntFlag](#) (uint32_t instance)
Gets the PDB interrupt flag.
- void [PDB_DRV_ClearTimerIntFlag](#) (uint32_t instance)
Clears the interrupt flag.
- void [PDB_DRV_LoadValuesCmd](#) (uint32_t instance)
Executes the command of loading values.
- void [PDB_DRV_SetTimerModulusValue](#) (uint32_t instance, uint32_t value)
Sets the value of timer modulus.
- void [PDB_DRV_SetValueForTimerInterrupt](#) (uint32_t instance, uint32_t value)
Sets the value for the timer interrupt.
- [pdb_status_t PDB_DRV_ConfigAdcPreTrigger](#) (uint32_t instance, uint32_t chn, const [pdb_adc_pretrigger_config_t](#) *configPtr)
Configures the ADC pre_trigger in the PDB module.
- uint32_t [PDB_DRV_GetAdcPreTriggerFlags](#) (uint32_t instance, uint32_t chn, uint32_t preChnMask)
Gets the ADC pre_trigger flag in the PDB module.
- void [PDB_DRV_ClearAdcPreTriggerFlags](#) (uint32_t instance, uint32_t chn, uint32_t preChnMask)
Clears the ADC pre_trigger flag in the PDB module.
- uint32_t [PDB_DRV_GetAdcPreTriggerSeqErrFlags](#) (uint32_t instance, uint32_t chn, uint32_t preChnMask)
Gets the ADC pre_trigger flag in the PDB module.
- void [PDB_DRV_ClearAdcPreTriggerSeqErrFlags](#) (uint32_t instance, uint32_t chn, uint32_t preChnMask)
Clears the ADC pre_trigger flag in the PDB module.
- void [PDB_DRV_SetAdcPreTriggerDelayValue](#) (uint32_t instance, uint32_t chn, uint32_t preChn, uint32_t value)
Sets the ADC pre_trigger delay value in the PDB module.
- void [PDB_DRV_SetCmpPulseOutEnable](#) (uint32_t instance, uint32_t pulseChnMask, bool enable)
Switches on/off the CMP pulse out in the PDB module.
- void [PDB_DRV_SetCmpPulseOutDelayForHigh](#) (uint32_t instance, uint32_t pulseChn, uint32_t value)
Sets the CMP pulse out delay value for high in the PDB module.
- void [PDB_DRV_SetCmpPulseOutDelayForLow](#) (uint32_t instance, uint32_t pulseChn, uint32_t value)
Sets the CMP pulse out delay value for low in the PDB module.

Variables

- PDB_Type *const [g_pdbBase](#) []

PDB Peripheral driver

Table of base addresses for PDB instances.

- const IRQn_Type [g_pdbIrqId](#) [PDB_INSTANCE_COUNT]

Table to save PDB IRQ enumeration numbers defined in the CMSIS header file.

51.3.5 Data Structure Documentation

51.3.5.1 struct `pdb_adc_pretrigger_config_t`

Data Fields

- uint32_t [adcPreTriggerIdx](#)
Setting pre_trigger's index.
- bool [preTriggerEnable](#)
Enables the pre_trigger.
- bool [preTriggerOutputEnable](#)
Enables the pre_trigger output.
- bool [preTriggerBackToBackEnable](#)
Enables the back to back mode for ADC pre_trigger.

51.3.6 Function Documentation

51.3.6.1 `pdb_status_t PDB_DRV_Init (uint32_t instance, const pdb_timer_config_t * userConfigPtr)`

This function initializes the PDB counter and triggers the input. It resets PDB registers and enables the PDB clock. Therefore, it should be called before any other operation. After it is initialized, the PDB can act as a triggered timer, which enables other features in PDB module.

Parameters

| | |
|----------------------|---|
| <i>instance</i> | PDB instance ID. |
| <i>userConfigPtr</i> | Pointer to the user configuration structure. See the "pdb_user_config_t". |

Returns

Execution status.

51.3.6.2 `pdb_status_t PDB_DRV_Deinit (uint32_t instance)`

This function deinitializes the PDB module. Calling this function shuts down the PDB module and reduces the power consumption.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
|-----------------|------------------|

Returns

Execution status.

51.3.6.3 void PDB_DRV_SoftTriggerCmd (uint32_t *instance*)

This function triggers the PDB with a software trigger. When the PDB is set to use the software trigger as input, calling this function triggers the PDB.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
|-----------------|------------------|

51.3.6.4 uint32_t PDB_DRV_GetTimerValue (uint32_t *instance*)

This function gets the current counter value.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
|-----------------|------------------|

Returns

Current PDB counter value.

51.3.6.5 bool PDB_DRV_GetTimerIntFlag (uint32_t *instance*)

This function gets the PDB interrupt flag. It is asserted if the PDB interrupt occurs.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
|-----------------|------------------|

PDB Peripheral driver

Returns

Assertion of indicated event.

51.3.6.6 void PDB_DRV_ClearTimerIntFlag (uint32_t *instance*)

This function clears the interrupt flag.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
|-----------------|------------------|

51.3.6.7 void PDB_DRV_LoadValuesCmd (uint32_t *instance*)

This function executes the command of loading values.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
| <i>value</i> | Setting value. |

51.3.6.8 void PDB_DRV_SetTimerModulusValue (uint32_t *instance*, uint32_t *value*)

This function sets the value of timer modulus.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
| <i>value</i> | Setting value. |

51.3.6.9 void PDB_DRV_SetValueForTimerInterrupt (uint32_t *instance*, uint32_t *value*)

This function sets the value for the timer interrupt.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
| <i>value</i> | Setting value. |

51.3.6.10 **pdb_status_t PDB_DRV_ConfigAdcPreTrigger (uint32_t instance, uint32_t chn, const pdb_adc_pretrigger_config_t * configPtr)**

This function configures the ADC pre_trigger in the PDB module.

Parameters

| | |
|------------------|---|
| <i>instance</i> | PDB instance ID. |
| <i>chn</i> | ADC channel. |
| <i>configPtr</i> | Pointer to the user configuration structure. See the "pdb_adc_pretrigger_config_t". |

Returns

Execution status.

51.3.6.11 **uint32_t PDB_DRV_GetAdcPreTriggerFlags (uint32_t instance, uint32_t chn, uint32_t preChnMask)**

This function gets the ADC pre_trigger flags in the PDB module.

Parameters

| | |
|-------------------|--------------------------------|
| <i>instance</i> | PDB instance ID. |
| <i>chn</i> | ADC channel. |
| <i>preChnMask</i> | ADC pre_trigger channels mask. |

Returns

Assertion of indicated flag.

51.3.6.12 **void PDB_DRV_ClearAdcPreTriggerFlags (uint32_t instance, uint32_t chn, uint32_t preChnMask)**

This function clears the ADC pre_trigger flags in the PDB module.

PDB Peripheral driver

Parameters

| | |
|-------------------|--------------------------------|
| <i>instance</i> | PDB instance ID. |
| <i>chn</i> | ADC channel. |
| <i>preChnMask</i> | ADC pre_trigger channels mask. |

51.3.6.13 uint32_t PDB_DRV_GetAdcPreTriggerSeqErrFlags (uint32_t *instance*, uint32_t *chn*, uint32_t *preChnMask*)

This function gets the ADC pre_trigger flags in the PDB module.

Parameters

| | |
|-------------------|--------------------------------|
| <i>instance</i> | PDB instance ID. |
| <i>chn</i> | ADC channel. |
| <i>preChnMask</i> | ADC pre_trigger channels mask. |

Returns

Assertion of indicated flag.

51.3.6.14 void PDB_DRV_ClearAdcPreTriggerSeqErrFlags (uint32_t *instance*, uint32_t *chn*, uint32_t *preChnMask*)

This function clears the ADC pre_trigger sequence error flags in the PDB module.

Parameters

| | |
|-------------------|--------------------------------|
| <i>instance</i> | PDB instance ID. |
| <i>chn</i> | ADC channel. |
| <i>preChnMask</i> | ADC pre_trigger channels mask. |

51.3.6.15 void PDB_DRV_SetAdcPreTriggerDelayValue (uint32_t *instance*, uint32_t *chn*, uint32_t *preChn*, uint32_t *value*)

This function sets Set the ADC pre_trigger delay value in the PDB module.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
| <i>chn</i> | ADC channel. |
| <i>preChn</i> | ADC pre_channel. |
| <i>value</i> | Setting value. |

51.3.6.16 void PDB_DRV_SetCmpPulseOutEnable (uint32_t *instance*, uint32_t *pulseChnMask*, bool *enable*)

This function switches the CMP pulse on/off in the PDB module.

Parameters

| | |
|---------------------|---------------------------------|
| <i>instance</i> | PDB instance ID. |
| <i>pulseChnMask</i> | Pulse channel mask. |
| <i>enable</i> | Switcher to assert the feature. |

51.3.6.17 void PDB_DRV_SetCmpPulseOutDelayForHigh (uint32_t *instance*, uint32_t *pulseChn*, uint32_t *value*)

This function sets the CMP pulse out delay value for high in the PDB module.

Parameters

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
| <i>pulseChn</i> | Pulse channel. |
| <i>value</i> | Setting value. |

51.3.6.18 void PDB_DRV_SetCmpPulseOutDelayForLow (uint32_t *instance*, uint32_t *pulseChn*, uint32_t *value*)

This function sets the CMP pulse out delay value for low in the PDB module.

Parameters

PDB Peripheral driver

| | |
|-----------------|------------------|
| <i>instance</i> | PDB instance ID. |
| <i>pulseChn</i> | Pulse channel. |
| <i>value</i> | Setting value. |

51.3.7 Variable Documentation

51.3.7.2 `const IRQn_Type g_pdbIrqId[PDB_INSTANCE_COUNT]`

Chapter 52

Periodic Interrupt Timer (PIT)

52.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Periodic Interrupt Timer (PIT) block of Kinetis devices.

Modules

- [PIT HAL driver](#)
- [PIT Peripheral driver](#)

PIT HAL driver

52.2 PIT HAL driver

52.2.1 Overview

This section describes the programming interface of the PIT HAL driver.

Enumerations

- enum [pit_status_t](#)
Error codes for PIT driver.

Initialization

- static void [PIT_HAL_Enable](#) (PIT_Type *base)
Enables the PIT module.
- static void [PIT_HAL_Disable](#) (PIT_Type *base)
Disables the PIT module.
- static void [PIT_HAL_SetTimerRunInDebugCmd](#) (PIT_Type *base, bool timerRun)
Configures the timers to continue running or to stop in debug mode.

Timer Start and Stop

- static void [PIT_HAL_StartTimer](#) (PIT_Type *base, uint32_t channel)
Starts the timer counting.
- static void [PIT_HAL_StopTimer](#) (PIT_Type *base, uint32_t channel)
Stops the timer from counting.
- static bool [PIT_HAL_IsTimerRunning](#) (PIT_Type *base, uint32_t channel)
Checks to see whether the current timer is started or not.

Timer Period

- static void [PIT_HAL_SetTimerPeriodByCount](#) (PIT_Type *base, uint32_t channel, uint32_t count)
Sets the timer period in units of count.
- static uint32_t [PIT_HAL_GetTimerPeriodByCount](#) (PIT_Type *base, uint32_t channel)
Returns the current timer period in units of count.
- static uint32_t [PIT_HAL_ReadTimerCount](#) (PIT_Type *base, uint32_t channel)
Reads the current timer counting value.

Interrupt

- static void [PIT_HAL_SetIntCmd](#) (PIT_Type *base, uint32_t channel, bool enable)
Enables or disables the timer interrupt.
- static bool [PIT_HAL_GetIntCmd](#) (PIT_Type *base, uint32_t channel)
Checks whether the timer interrupt is enabled or not.

- static void **PIT_HAL_ClearIntFlag** (PIT_Type *base, uint32_t channel)
Clears the timer interrupt flag.
- static bool **PIT_HAL_IsIntPending** (PIT_Type *base, uint32_t channel)
Reads the current timer timeout flag.

52.2.2 Enumeration Type Documentation

52.2.2.1 enum pit_status_t

52.2.3 Function Documentation

52.2.3.1 static void PIT_HAL_Enable (PIT_Type * *base*) [inline], [static]

This function enables the PIT timer clock (Note: this function does not un-gate the system clock gating control). It should be called before any other timer related setup.

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PIT instance. |
|-------------|--|

52.2.3.2 static void PIT_HAL_Disable (PIT_Type * *base*) [inline], [static]

This function disables all PIT timer clocks (Note: it does not affect the SIM clock gating control).

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PIT instance. |
|-------------|--|

52.2.3.3 static void PIT_HAL_SetTimerRunInDebugCmd (PIT_Type * *base*, bool *timerRun*) [inline], [static]

In debug mode, the timers may or may not be frozen, based on the configuration of this function. This is intended to aid software development, allowing the developer to halt the processor, investigate the current state of the system (for example, the timer values), and continue the operation.

Parameters

PIT HAL driver

| | |
|-----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>timerRun</i> | Timers run or stop in debug mode. <ul style="list-style-type: none"> • true: Timers continue to run in debug mode. • false: Timers stop in debug mode. |

52.2.3.4 static void PIT_HAL_StartTimer (PIT_Type * *base*, uint32_t *channel*) [inline], [static]

After calling this function, timers load the start value as specified by the function [PIT_HAL_SetTimerPeriodByCount\(PIT_Type * base, uint32_t channel, uint32_t count\)](#), count down to 0, and load the respective start value again. Each time a timer reaches 0, it generates a trigger pulse and sets the time-out interrupt flag.

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

52.2.3.5 static void PIT_HAL_StopTimer (PIT_Type * *base*, uint32_t *channel*) [inline], [static]

This function stops every timer from counting. Timers reload their periods respectively after they call the [PIT_HAL_StartTimer](#) the next time.

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

52.2.3.6 static bool PIT_HAL_IsTimerRunning (PIT_Type * *base*, uint32_t *channel*) [inline], [static]

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

Returns

Current timer running status -true: Current timer is running. -false: Current timer has stopped.

52.2.3.7 static void PIT_HAL_SetTimerPeriodByCount (PIT_Type * *base*, uint32_t *channel*, uint32_t *count*) [inline], [static]

Timers begin counting from the value set by this function. The counter period of a running timer can be modified by first stopping the timer, setting a new load value, and starting the timer again. If timers are not restarted, the new value is loaded after the next trigger event.

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |
| <i>count</i> | Timer period in units of count |

52.2.3.8 static uint32_t PIT_HAL_GetTimerPeriodByCount (PIT_Type * *base*, uint32_t *channel*) [inline], [static]
Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

Returns

Timer period in units of count

52.2.3.9 static uint32_t PIT_HAL_ReadTimerCount (PIT_Type * *base*, uint32_t *channel*) [inline], [static]

This function returns the real-time timer counting value, in a range from 0 to a timer period.

PIT HAL driver

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

Returns

Current timer counting value

52.2.3.10 `static void PIT_HAL_SetIntCmd (PIT_Type * base, uint32_t channel, bool enable) [inline], [static]`

If enabled, an interrupt happens when a timeout event occurs (Note: NVIC should be called to enable pit interrupt in system level).

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |
| <i>enable</i> | Enable or disable interrupt. <ul style="list-style-type: none"> • true: Generate interrupt when timer counts to 0. • false: No interrupt is generated. |

52.2.3.11 `static bool PIT_HAL_GetIntCmd (PIT_Type * base, uint32_t channel) [inline], [static]`

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

Returns

Status of enabled or disabled interrupt

- true: Interrupt is enabled.
- false: Interrupt is disabled.

52.2.3.12 `static void PIT_HAL_ClearIntFlag (PIT_Type * base, uint32_t channel) [inline], [static]`

This function clears the timer interrupt flag after a timeout event occurs.

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

**52.2.3.13 static bool PIT_HAL_IsIntPending (PIT_Type * *base*, uint32_t *channel*)
 [inline], [static]**

Every time the timer counts to 0, this flag is set.

Parameters

| | |
|----------------|--|
| <i>base</i> | Base address for current PIT instance. |
| <i>channel</i> | Timer channel number |

Returns

Current status of the timeout flag

- true: Timeout has occurred.
- false: Timeout has not yet occurred.

PIT Peripheral driver

52.3 PIT Peripheral driver

52.3.1 Overview

This section describes the programming interface of the PIT Peripheral driver. The PIT driver configures PIT timers and initializes and configures timer periods.

52.3.2 PIT Initialization

1. To initialize the PIT module, call the `PIT_DRV_Init` function. This function enables the PIT module and clock automatically.
2. The parameter passed in the `PIT_DRV_Init` configures the timers to run or stop in debug mode. To use one timer channel, call the `PIT_DRV_InitChannel` initialize that channel.

This is example code to initialize and configure the driver:

```
// Define device configuration.
const pit_config_t pitInit = {
    isInterruptEnabled = false, // Disable timer interrupt.
    isTimerChained = false,    // Meaningless for timer 0.
    periodUs = 20U             // Set timer period to 20 us.
};

// Initialize PIT instance 0. Timers will stop running in debug mode.
PIT_DRV_Init(0, stop);

// Initialize PIT instance 0, timer 0.
PIT_DRV_InitChannel(0, 0, &pitInit);
```

52.3.3 PIT Timer Period

The PIT driver provides four ways to set the timer period.

1. The `PIT_DRV_InitChannel` function sets the timer period in microseconds. It is only applicable when initializing the channel.
2. The void `PIT_DRV_SetTimerPeriodByUs(uint32_t instance, uint32_t timer, uint32_t us)` function sets the timer period in microseconds. It is applicable at any time.
3. The void `PIT_DRV_SetLifetimeTimerPeriodByUs(uint32_t instance, uint64_t us)` function sets the lifetime timer period in microseconds. It only supports specific MCUs. Check the appropriate reference manual before using this function.
4. The void `PIT_HAL_SetTimerPeriodByCount(uint32_t instance, uint32_t timer, uint32_t count)` function sets the timer period in units of count. To use this function, include the `fsl_pit_hal.h`.

To read the current timer counting value in microseconds, call the `uint32_t PIT_DRV_ReadTimerUs(uint32_t instance, uint32_t timer)` function.

52.3.4 PIT Timer Operation

After the timer setting is complete, call the void `PIT_DRV_StartTimer(uint32_t timer)` function to start timer counting. Call the void `PIT_DRV_StopTimer(uint32_t instance, uint32_t timer)` function to stop it at any time.

To close the PIT module entirely, call the void `PIT_DRV_Deinit(uint32_t instance)` function. This disables both the PIT module and the clock gate.

Data Structures

- struct `pit_user_config_t`
PIT timer configuration structure. [More...](#)

Variables

- PIT_Type *const `g_pitBase []`
Table of base addresses for pit instances.

Initialization and Shutdown

- `pit_status_t PIT_DRV_Init` (uint32_t instance, bool isRunInDebug)
Initializes the PIT module.
- `pit_status_t PIT_DRV_Deinit` (uint32_t instance)
Disables the PIT module and gate control.
- void `PIT_DRV_InitChannel` (uint32_t instance, uint32_t channel, const `pit_user_config_t *config`)
Initializes the PIT channel.

Timer Start and Stop

- void `PIT_DRV_StartTimer` (uint32_t instance, uint32_t channel)
Starts the timer counting.
- void `PIT_DRV_StopTimer` (uint32_t instance, uint32_t channel)
Stops the timer counting.

Timer Period

- void `PIT_DRV_SetTimerPeriodByUs` (uint32_t instance, uint32_t channel, uint32_t us)
Sets the timer period in microseconds.
- uint32_t `PIT_DRV_GetTimerPeriodByUs` (uint32_t instance, uint32_t channel)
Gets the timer period in microseconds for a single channel.
- uint32_t `PIT_DRV_ReadTimerUs` (uint32_t instance, uint32_t channel)
Reads the current timer value in microseconds.
- void `PIT_DRV_SetTimerPeriodByCount` (uint32_t instance, uint32_t channel, uint32_t count)

PIT Peripheral driver

- *Sets the timer period in units of count.*
 uint32_t [PIT_DRV_GetTimerPeriodByCount](#) (uint32_t instance, uint32_t channel)
Returns the current timer period in units of count.
- uint32_t [PIT_DRV_ReadTimerCount](#) (uint32_t instance, uint32_t channel)
Reads the current timer counting value.

Interrupt

- void [PIT_DRV_ClearIntFlag](#) (uint32_t instance, uint32_t channel)
Clears the timer interrupt flag.
- bool [PIT_DRV_IsIntPending](#) (uint32_t instance, uint32_t channel)
Reads the current timer timeout flag.

52.3.5 Data Structure Documentation

52.3.5.1 struct pit_user_config_t

Defines a structure PitConfig and uses the [PIT_DRV_InitChannel\(\)](#) function to make necessary initializations. The remaining functions can be used for PIT configuration.

Note

The timer chain feature is not valid in all devices. Check the `fsl_pit_features.h` for accurate settings. If it's not valid, the value set here is bypassed inside the [PIT_DRV_InitChannel\(\)](#) function.

Data Fields

- bool [isInterruptEnabled](#)
Timer interrupt 0-disable/1-enable.
- uint32_t [periodUs](#)
Timer period in unit of microseconds.

52.3.6 Function Documentation

52.3.6.1 pit_status_t PIT_DRV_Init (uint32_t instance, bool isRunInDebug)

Call this function before calling any other PIT driver functions. This function un-gates the PIT clock and enables the PIT module. The `isRunInDebug` passed into function affects all timer channels.

Parameters

| | |
|---------------------|--|
| <i>instance</i> | PIT module instance number. |
| <i>isRunInDebug</i> | Timers run or stop in debug mode. <ul style="list-style-type: none"> • true: Timers continue to run in debug mode. • false: Timers stop in debug mode. |

Returns

Error or success status returned by API.

52.3.6.2 pit_status_t PIT_DRV_Deinit (uint32_t instance)

This function disables all PIT interrupts and PIT clock. It then gates the PIT clock control. PIT_DRV_Init must be called to use PIT again.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
|-----------------|-----------------------------|

Returns

Error or success status returned by API.

52.3.6.3 void PIT_DRV_InitChannel (uint32_t instance, uint32_t channel, const pit_user_config_t * config)

This function initializes the PIT timers by using a channel. Pass in the timer number and its configuration structure. Timers do not start counting by default after calling this function. The function PIT_DRV_StartTimer must be called to start the timer counting. Call the PIT_DRV_SetTimerPeriodByUs to re-set the period.

This is an example demonstrating how to define a PIT channel configuration structure:

```
pit_user_config_t pitTestInit = {
    .isInterruptEnabled = true,
    // In unit of microseconds.
    .periodUs = 1000,
};
```

PIT Peripheral driver

Parameters

| | |
|-----------------|--------------------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number. |
| <i>config</i> | PIT channel configuration structure. |

52.3.6.4 void PIT_DRV_StartTimer (uint32_t instance, uint32_t channel)

After calling this function, timers load period value, count down to 0 and then load the respective start value again. Each time a timer reaches 0, it generates a trigger pulse and sets the timeout interrupt flag.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number. |

52.3.6.5 void PIT_DRV_StopTimer (uint32_t instance, uint32_t channel)

This function stops every timer counting. Timers reload their periods respectively after the next time they call the PIT_DRV_StartTimer.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number. |

52.3.6.6 void PIT_DRV_SetTimerPeriodByUs (uint32_t instance, uint32_t channel, uint32_t us)

The period range depends on the frequency of the PIT source clock. If the required period is out of range, use the lifetime timer if applicable. This function is only valid for one channel. If channels are chained together, the period makes no sense.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
|-----------------|-----------------------------|

| | |
|----------------|-------------------------------|
| <i>channel</i> | Timer channel number. |
| <i>us</i> | Timer period in microseconds. |

52.3.6.7 uint32_t PIT_DRV_GetTimerPeriodByUs (uint32_t instance, uint32_t channel)

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number. |

Returns

Timer period in microseconds.

52.3.6.8 uint32_t PIT_DRV_ReadTimerUs (uint32_t instance, uint32_t channel)

This function returns an absolute time stamp in microseconds. One common use of this function is to measure the running time of a part of code. Call this function at both the beginning and end of code. The time difference between these two time stamps is the running time. Make sure the running time does not exceed the timer period. The time stamp returned is up-counting.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number. |

Returns

Current timer value in microseconds.

52.3.6.9 void PIT_DRV_SetTimerPeriodByCount (uint32_t instance, uint32_t channel, uint32_t count)

Timers begin counting from the value set by this function. The counter period of a running timer can be modified by first stopping the timer, setting a new load value, and starting the timer again. If timers are not restarted, the new value is loaded after the next trigger event.

PIT Peripheral driver

Parameters

| | |
|-----------------|--------------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number |
| <i>count</i> | Timer period in units of count |

52.3.6.10 uint32_t PIT_DRV_GetTimerPeriodByCount (uint32_t *instance*, uint32_t *channel*)

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number |

Returns

Timer period in units of count

52.3.6.11 uint32_t PIT_DRV_ReadTimerCount (uint32_t *instance*, uint32_t *channel*)

This function returns the real-time timer counting value in a range from 0 to a timer period.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number |

Returns

Current timer counting value

52.3.6.12 void PIT_DRV_ClearIntFlag (uint32_t *instance*, uint32_t *channel*)

This function clears the timer interrupt flag after a timeout event occurs.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number |

52.3.6.13 bool PIT_DRV_IsIntPending (uint32_t *instance*, uint32_t *channel*)

This flag is set every time the timer counts to 0.

Parameters

| | |
|-----------------|-----------------------------|
| <i>instance</i> | PIT module instance number. |
| <i>channel</i> | Timer channel number |

Returns

- Current status of the timeout flag
- true: Timeout has occurred.
 - false: Timeout has not yet occurred.

PIT Peripheral driver

Chapter 53

Port Control and Interrupts (PORT)

53.1 Overview

The Kinetis SDK provides a HAL driver for the Port Control and Interrupts (PORT) block of Kinetis devices.

Modules

- [PORT HAL driver](#)

PORT HAL driver

53.2 PORT HAL driver

53.2.1 Overview

The section describes the programming interface of the PORT HAL driver, Port control and interrupts hardware driver configuration. Use these functions to set port control and external interrupt functions. Most functions can be configured independently for each pin in the 32-bit port and affect the pin regardless of its pin muxing state. To use these functions, pass to the instance number (HW_PORTA, HW_PORTB, HW_PORTC, and so on.).

Files

- file [fsl_port_hal.h](#)

The port features such as digital filter, pull, and so on are valid when they are available in one of the pins.

Enumerations

- enum [port_pull_t](#) {
[kPortPullDown](#) = 0U,
[kPortPullUp](#) = 1U }
Internal resistor pull feature selection.
- enum [port_slew_rate_t](#) {
[kPortFastSlewRate](#) = 0U,
[kPortSlowSlewRate](#) = 1U }
Slew rate selection.
- enum [port_drive_strength_t](#) {
[kPortLowDriveStrength](#) = 0U,
[kPortHighDriveStrength](#) = 1U }
Configures the drive strength.
- enum [port_mux_t](#) {
[kPortPinDisabled](#) = 0U,
[kPortMuxAsGpio](#) = 1U,
[kPortMuxAlt2](#) = 2U,
[kPortMuxAlt3](#) = 3U,
[kPortMuxAlt4](#) = 4U,
[kPortMuxAlt5](#) = 5U,
[kPortMuxAlt6](#) = 6U,
[kPortMuxAlt7](#) = 7U }
Pin mux selection.
- enum [port_interrupt_config_t](#) {
[kPortIntDisabled](#) = 0x0U,
[kPortIntLogicZero](#) = 0x8U,
[kPortIntRisingEdge](#) = 0x9U,
[kPortIntFallingEdge](#) = 0xAU,
[kPortIntEitherEdge](#) = 0xBU,

`kPortIntLogicOne = 0xCU }`
Digital filter clock source selection.

Configuration

- static void `PORT_HAL_SetMuxMode` (PORT_Type *base, uint32_t pin, `port_mux_t` mux)
Configures the pin muxing.
- void `PORT_HAL_SetLowGlobalPinCtrl` (PORT_Type *base, uint16_t lowPinSelect, uint16_t config)
Configures the low half of the pin control register for the same settings.
- void `PORT_HAL_SetHighGlobalPinCtrl` (PORT_Type *base, uint16_t highPinSelect, uint16_t config)
Configures the high half of the pin control register for the same settings.

Interrupt

- static void `PORT_HAL_SetPinIntMode` (PORT_Type *base, uint32_t pin, `port_interrupt_config_t` intConfig)
Configures the port pin interrupt/DMA request.
- static `port_interrupt_config_t` `PORT_HAL_GetPinIntMode` (PORT_Type *base, uint32_t pin)
Gets the current port pin interrupt/DMA request configuration.
- static bool `PORT_HAL_IsPinIntPending` (PORT_Type *base, uint32_t pin)
Reads the individual pin-interrupt status flag.
- static void `PORT_HAL_ClearPinIntFlag` (PORT_Type *base, uint32_t pin)
Clears the individual pin-interrupt status flag.
- static uint32_t `PORT_HAL_GetPortIntFlag` (PORT_Type *base)
Reads the entire port interrupt status flag.
- static void `PORT_HAL_ClearPortIntFlag` (PORT_Type *base)
Clears the entire port interrupt status flag.

53.2.2 Enumeration Type Documentation

53.2.2.1 enum port_pull_t

Enumerator

kPortPullDown Internal pull-down resistor is enabled.
kPortPullUp Internal pull-up resistor is enabled.

53.2.2.2 enum port_slew_rate_t

Enumerator

kPortFastSlewRate Fast slew rate is configured.

PORT HAL driver

kPortSlowSlewRate Slow slew rate is configured.

53.2.2.3 enum port_drive_strength_t

Enumerator

kPortLowDriveStrength Low drive strength is configured.

kPortHighDriveStrength High drive strength is configured.

53.2.2.4 enum port_mux_t

Enumerator

kPortPinDisabled Corresponding pin is disabled, but is used as an analog pin.

kPortMuxAsGpio Corresponding pin is configured as GPIO.

kPortMuxAlt2 Chip-specific.

kPortMuxAlt3 Chip-specific.

kPortMuxAlt4 Chip-specific.

kPortMuxAlt5 Chip-specific.

kPortMuxAlt6 Chip-specific.

kPortMuxAlt7 Chip-specific.

53.2.2.5 enum port_interrupt_config_t

Configures the interrupt generation condition.

Enumerator

kPortIntDisabled Interrupt/DMA request is disabled.

kPortIntLogicZero Interrupt when logic zero.

kPortIntRisingEdge Interrupt on rising edge.

kPortIntFallingEdge Interrupt on falling edge.

kPortIntEitherEdge Interrupt on either edge.

kPortIntLogicOne Interrupt when logic one.

53.2.3 Function Documentation

53.2.3.1 `static void PORT_HAL_SetMuxMode (PORT_Type * base, uint32_t pin, port_mux_t mux) [inline], [static]`

Parameters

| | |
|-------------|---|
| <i>base</i> | port base pointer |
| <i>pin</i> | port pin number |
| <i>mux</i> | pin muxing slot selection <ul style="list-style-type: none"> • kPortPinDisabled: Pin disabled. • kPortMuxAsGpio : Set as GPIO. • others : chip-specific. |

53.2.3.2 void PORT_HAL_SetLowGlobalPinCtrl (PORT_Type * *base*, uint16_t *lowPinSelect*, uint16_t *config*)

This function operates pin 0 -15 of one specific port.

Parameters

| | |
|---------------------|---|
| <i>base</i> | port base pointer |
| <i>lowPinSelect</i> | update corresponding pin control register or not. For a specific bit: <ul style="list-style-type: none"> • 0: corresponding low half of pin control register won't be updated according to configuration. • 1: corresponding low half of pin control register will be updated according to configuration. |
| <i>config</i> | value is written to a low half port control register bits[15:0]. |

53.2.3.3 void PORT_HAL_SetHighGlobalPinCtrl (PORT_Type * *base*, uint16_t *highPinSelect*, uint16_t *config*)

This function operates pin 16 -31 of one specific port.

Parameters

| | |
|----------------------|---|
| <i>base</i> | port base pointer |
| <i>highPinSelect</i> | update corresponding pin control register or not. For a specific bit: <ul style="list-style-type: none"> • 0: corresponding high half of pin control register won't be updated according to configuration. • 1: corresponding high half of pin control register will be updated according to configuration. |
| <i>config</i> | value is written to a high half port control register bits[15:0]. |

PORT HAL driver

53.2.3.4 static void PORT_HAL_SetPinIntMode (PORT_Type * *base*, uint32_t *pin*, port_interrupt_config_t *intConfig*) [inline], [static]

Parameters

| | |
|------------------|--|
| <i>base</i> | port base pointer. |
| <i>pin</i> | port pin number |
| <i>intConfig</i> | interrupt configuration <ul style="list-style-type: none"> • kPortIntDisabled : Interrupt/DMA request disabled. • kPortDmaRisingEdge : DMA request on rising edge. • kPortDmaFallingEdge: DMA request on falling edge. • kPortDmaEitherEdge : DMA request on either edge. • kPortIntLogicZero : Interrupt when logic zero. • kPortIntRisingEdge : Interrupt on rising edge. • kPortIntFallingEdge: Interrupt on falling edge. • kPortIntEitherEdge : Interrupt on either edge. • kPortIntLogicOne : Interrupt when logic one. |

53.2.3.5 static port_interrupt_config_t PORT_HAL_GetPinIntMode (PORT_Type * *base*, uint32_t *pin*) [inline], [static]

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | port base pointer |
| <i>pin</i> | port pin number |

Returns

interrupt configuration

- kPortIntDisabled : Interrupt/DMA request disabled.
- kPortDmaRisingEdge : DMA request on rising edge.
- kPortDmaFallingEdge: DMA request on falling edge.
- kPortDmaEitherEdge : DMA request on either edge.
- kPortIntLogicZero : Interrupt when logic zero.
- kPortIntRisingEdge : Interrupt on rising edge.
- kPortIntFallingEdge: Interrupt on falling edge.
- kPortIntEitherEdge : Interrupt on either edge.
- kPortIntLogicOne : Interrupt when logic one.

**53.2.3.6 static bool PORT_HAL_IsPinIntPending (PORT_Type * *base*, uint32_t *pin*)
[inline], [static]**

If a pin is configured to generate the DMA request, the corresponding flag is cleared automatically at the completion of the requested DMA transfer. Otherwise, the flag remains set until a logic one is written to that flag. If configured for a level sensitive interrupt that remains asserted, the flag is set again immediately.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | port base pointer |
| <i>pin</i> | port pin number |

Returns

- current pin interrupt status flag
- 0: interrupt is not detected.
 - 1: interrupt is detected.

**53.2.3.7 static void PORT_HAL_ClearPinIntFlag (PORT_Type * *base*, uint32_t *pin*)
[inline], [static]**

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | port base pointer |
| <i>pin</i> | port pin number |

**53.2.3.8 static uint32_t PORT_HAL_GetPortIntFlag (PORT_Type * *base*) [inline],
[static]**

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | port base pointer |
|-------------|-------------------|

Returns

- all 32 pin interrupt status flags. For specific bit:
- 0: interrupt is not detected.
 - 1: interrupt is detected.

**53.2.3.9 static void PORT_HAL_ClearPortIntFlag (PORT_Type * *base*) [inline],
[static]**

PORT HAL driver

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | port base pointer |
|-------------|-------------------|

Chapter 54

Power Management Controller (PMC)

54.1 Overview

The Kinetis SDK provides a HAL driver for the Power Management Controller (PMC) block of Kinetis devices.

Modules

- [PMC HAL driver](#)

PMC HAL driver

54.2 PMC HAL driver

54.2.1 Overview

The Power Management Controller (PMC) contains the internal voltage regulator, power on reset (POR), and low voltage detect system.

The PMC HAL driver provides these APIs:

- APIs for low voltage detection
- APIs for band gap setting
- APIs for I/O latch state

The low voltage detection can be configured by these functions: [PMC_HAL_LowVoltDetectConfig\(\)](#) and [PMC_HAL_LowVoltWarnConfig\(\)](#).

Use the function [PMC_HAL_GetLowVoltDetectFlag\(\)/PMC_HAL_GetLowVoltWarnFlag\(\)](#) to check the low voltage detection state. Use the function [PMC_HAL_SetLowVoltDetectAck\(\)/PMC_HAL_SetLowVoltWarnAck\(\)](#) to clear the flags.

To configure the band gap, use the [PMC_HAL_BandgapBufferConfig\(\)](#) function. For I/O latch state, use the [PMC_HAL_GetAckIsolation\(\)/PMC_HAL_ClearAckIsolation\(\)](#) function.

Files

- file [fsl_pmc_hal.h](#)

Data Structures

- struct [pmc_bandgap_buffer_config_t](#)
Bandgap Buffer configuration. [More...](#)

Enumerations

- enum [pmc_low_volt_warn_volt_select_t](#) {
[kPmcLowVoltWarnVoltLowTrip](#),
[kPmcLowVoltWarnVoltMid1Trip](#),
[kPmcLowVoltWarnVoltMid2Trip](#),
[kPmcLowVoltWarnVoltHighTrip](#) }
Low-Voltage Warning Voltage Select.
- enum [pmc_low_volt_detect_volt_select_t](#) {
[kPmcLowVoltDetectVoltLowTrip](#),
[kPmcLowVoltDetectVoltHighTrip](#) }
Low-Voltage Detect Voltage Select.

Power Management Controller Control APIs

- static void [PMC_HAL_LowVoltDetectConfig](#) (PMC_Type *base, bool enableInt, bool enableReset, [pmc_low_volt_detect_volt_select_t](#) voltSelect)
Configure the low voltage detect setting.
- static void [PMC_HAL_SetLowVoltDetectAck](#) (PMC_Type *base)
Low-Voltage Detect Acknowledge.
- static bool [PMC_HAL_GetLowVoltDetectFlag](#) (PMC_Type *base)
Low-Voltage Detect Flag Read.
- static void [PMC_HAL_LowVoltWarnConfig](#) (PMC_Type *base, bool enableInt, [pmc_low_volt_warn_volt_select_t](#) voltSelect)
Configure the low voltage warning setting.
- static void [PMC_HAL_SetLowVoltWarnAck](#) (PMC_Type *base)
Low-Voltage Warning Acknowledge.
- static bool [PMC_HAL_GetLowVoltWarnFlag](#) (PMC_Type *base)
Low-Voltage Warning Flag Read.
- static void [PMC_HAL_BandgapBufferConfig](#) (PMC_Type *base, [pmc_bandgap_buffer_config_t](#) *config)
Configures the PMC bandgap.
- static uint8_t [PMC_HAL_GetAckIsolation](#) (PMC_Type *base)
Gets the acknowledge isolation value.
- static void [PMC_HAL_ClearAckIsolation](#) (PMC_Type *base)
Clears an acknowledge isolation.
- static uint8_t [PMC_HAL_GetRegulatorStatus](#) (PMC_Type *base)
Gets the Regulator regulation status.

54.2.2 Data Structure Documentation

54.2.2.1 struct pmc_bandgap_buffer_config_t

Data Fields

- bool [enable](#)
Enable bandgap buffer.

54.2.2.1.0.3 Field Documentation

54.2.2.1.0.3.1 bool pmc_bandgap_buffer_config_t::enable

54.2.3 Enumeration Type Documentation

54.2.3.1 enum pmc_low_volt_warn_volt_select_t

Enumerator

- kPmcLowVoltWarnVoltLowTrip*** Low trip point selected (VLVW = VLVW1)
- kPmcLowVoltWarnVoltMid1Trip*** Mid 1 trip point selected (VLVW = VLVW2)
- kPmcLowVoltWarnVoltMid2Trip*** Mid 2 trip point selected (VLVW = VLVW3)

PMC HAL driver

kPmcLowVoltWarnVoltHighTrip High trip point selected (VLVW = VLVW4)

54.2.3.2 enum pmc_low_volt_detect_volt_select_t

Enumerator

kPmcLowVoltDetectVoltLowTrip Low trip point selected (V LVD = V LVDL)

kPmcLowVoltDetectVoltHighTrip High trip point selected (V LVD = V LVDP)

54.2.4 Function Documentation

54.2.4.1 static void PMC_HAL_LowVoltDetectConfig (PMC_Type * *base*, bool *enableInt*, bool *enableReset*, pmc_low_volt_detect_volt_select_t *voltSelect*) [inline], [static]

This function configures the low voltage detect setting, including the trip point voltage setting, enable interrupt or not, enable MCU reset or not.

Parameters

| | |
|--------------------|--|
| <i>base</i> | Base address for current PMC instance. |
| <i>enableInt</i> | Enable interrupt or not when low voltage detect. |
| <i>enableReset</i> | Enable MCU reset or not when low voltage detect. |
| <i>voltSelect</i> | Low voltage detect trip point voltage. |

54.2.4.2 static void PMC_HAL_SetLowVoltDetectAck (PMC_Type * *base*) [inline], [static]

This function acknowledges the low voltage detection errors (write 1 to clear LVDF).

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PMC instance. |
|-------------|--|

54.2.4.3 static bool PMC_HAL_GetLowVoltDetectFlag (PMC_Type * *base*) [inline], [static]

This function reads the current LVDF status. If it returns 1, a low voltage event is detected.

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PMC instance. |
|-------------|--|

Returns

Current low voltage detect flag

- true: Low-Voltage detected
- false: Low-Voltage not detected

54.2.4.4 static void PMC_HAL_LowVoltWarnConfig (PMC_Type * *base*, bool *enableInt*, pmc_low_volt_warn_volt_select_t *voltSelect*) [inline], [static]

This function configures the low voltage warning setting, including the trip point voltage setting and enable interrupt or not.

Parameters

| | |
|-------------------|--|
| <i>base</i> | Base address for current PMC instance. |
| <i>enableInt</i> | Enable interrupt or not when low voltage detect. |
| <i>voltSelect</i> | Low voltage detect trip point voltage. |

54.2.4.5 static void PMC_HAL_SetLowVoltWarnAck (PMC_Type * *base*) [inline], [static]

This function acknowledges the low voltage warning errors (write 1 to clear LVWF).

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PMC instance. |
|-------------|--|

54.2.4.6 static bool PMC_HAL_GetLowVoltWarnFlag (PMC_Type * *base*) [inline], [static]

This function polls the current LVWF status. When 1 is returned, it indicates a low-voltage warning event. LVWF is set when V Supply transitions below the trip point or after reset and V Supply is already below the V LVW.

PMC HAL driver

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PMC instance. |
|-------------|--|

Returns

Current LVWF status

- true: Low-Voltage Warning Flag is set.
- false: the Low-Voltage Warning does not happen.

54.2.4.7 static void PMC_HAL_BandgapBufferConfig (PMC_Type * *base*, pmc_bandgap_buffer_config_t * *config*) [inline], [static]

This function configures the PMC bandgap, including the drive select and behavior in low power mode.

Parameters

| | |
|---------------|--|
| <i>base</i> | Base address for current PMC instance. |
| <i>config</i> | Pointer to the configuration. |

54.2.4.8 static uint8_t PMC_HAL_GetAckIsolation (PMC_Type * *base*) [inline], [static]

This function reads the Acknowledge Isolation setting that indicates whether certain peripherals and the I/O pads are in a latched state as a result of having been in the VLLS mode.

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PMC instance. |
|-------------|--|

Returns

ACK isolation 0 - Peripherals and I/O pads are in a normal run state. 1 - Certain peripherals and I/O pads are in an isolated and latched state.

54.2.4.9 static void PMC_HAL_ClearAckIsolation (PMC_Type * *base*) [inline], [static]

This function clears the ACK Isolation flag. Writing one to this setting when it is set releases the I/O pads and certain peripherals to their normal run mode state.

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PMC instance. |
|-------------|--|

54.2.4.10 static uint8_t PMC_HAL_GetRegulatorStatus (PMC_Type * *base*) [inline], [static]

This function returns the regulator to a run regulation status. It provides the current status of the internal voltage regulator.

Parameters

| | |
|-------------|--|
| <i>base</i> | Base address for current PMC instance. |
|-------------|--|

Returns

Regulation status 0 - Regulator is in a stop regulation or in transition to/from the regulation. 1 - Regulator is in a run regulation.

Chapter 55 Power Manager (Power)

55.1 Overview

The Kinetis SDK Power Manager provides a set of API/services to configure the power-related IPs, such as SMC, PMC, RCM, and so on.

Modules

- [Power Manager driver](#)

Data Structures

- struct [power_manager_user_config_t](#)
Power mode user configuration structure. [More...](#)
- struct [power_manager_notify_struct_t](#)
Power notification structure passed to the registered callback function. [More...](#)
- struct [power_manager_callback_user_config_t](#)
callback configuration structure [More...](#)
- struct [power_manager_state_t](#)
Power Manager internal state structure. [More...](#)

Typedefs

- typedef void [power_manager_callback_data_t](#)
Callback-specific data.
- typedef
[power_manager_error_code_t](#)(* [power_manager_callback_t](#))(power_manager_notify_struct_t *notify, [power_manager_callback_data_t](#) *dataPtr)
Callback prototype.

Enumerations

- enum [power_manager_modes_t](#) {
kPowerManagerRun,
kPowerManagerVlpr,
kPowerManagerWait,
kPowerManagerVlprw,
kPowerManagerStop,
kPowerManagerVlps,
kPowerManagerVlls1,
kPowerManagerVlls3 }
Power modes enumeration.

Overview

- enum `power_manager_error_code_t` {
`kPowerManagerSuccess`,
`kPowerManagerError`,
`kPowerManagerErrorOutOfRange`,
`kPowerManagerErrorSwitch`,
`kPowerManagerErrorNotificationBefore`,
`kPowerManagerErrorNotificationAfter`,
`kPowerManagerErrorClock` }
Power Manager success code and error codes.
- enum `power_manager_policy_t` {
`kPowerManagerPolicyAgreement`,
`kPowerManagerPolicyForcible` }
Power Manager policies.
- enum `power_manager_notify_t` {
`kPowerManagerNotifyRecover` = 0x00U,
`kPowerManagerNotifyBefore` = 0x01U,
`kPowerManagerNotifyAfter` = 0x02U }
The Power Manager notification type.
- enum `power_manager_callback_type_t` {
`kPowerManagerCallbackBefore` = 0x01U,
`kPowerManagerCallbackAfter` = 0x02U,
`kPowerManagerCallbackBeforeAfter` = 0x03U }
The callback type, indicates what kinds of notification this callback handles.

Functions

- `power_manager_error_code_t POWER_SYS_Init` (`power_manager_user_config_t` const `**power-ConfigsPtr`, `uint8_t` `configsNumber`, `power_manager_callback_user_config_t` `**callbacksPtr`, `uint8_t` `callbacksNumber`)
Power Manager initialization for operation.
- `power_manager_error_code_t POWER_SYS_Deinit` (`void`)
This function deinitializes the Power Manager.
- `power_manager_error_code_t POWER_SYS_SetMode` (`uint8_t` `powerModeIndex`, `power_manager_policy_t` `policy`)
This function configures the power mode.
- `power_manager_error_code_t POWER_SYS_GetLastMode` (`uint8_t` `*powerModeIndexPtr`)
This function returns power mode set as the last one.
- `power_manager_error_code_t POWER_SYS_GetLastModeConfig` (`power_manager_user_config_t` const `**powerModePtr`)
This function returns user configuration structure of power mode set as the last one.
- `power_manager_modes_t POWER_SYS_GetCurrentMode` (`void`)
This function returns the currently running power mode.
- `uint8_t POWER_SYS_GetErrorCallbackIndex` (`void`)
This function returns the last failed notification callback.
- `power_manager_callback_user_config_t * POWER_SYS_GetErrorCallback` (`void`)
This function returns the last failed notification callback configuration structure.
- `bool POWER_SYS_GetVeryLowPowerModeStatus` (`void`)
This function returns whether very low power mode is running.

- bool [POWER_SYS_GetLowLeakageWakeupResetStatus](#) (void)
This function returns whether reset was caused by low leakage wake up.
- bool [POWER_SYS_GetAckIsolation](#) (void)
Gets the acknowledge isolation flag.
- void [POWER_SYS_ClearAckIsolation](#) (void)
Clears the acknowledge isolation flag.

55.2 Data Structure Documentation

55.2.1 struct power_manager_user_config_t

This structure defines Kinetis power mode with additional power options and specifies transition to and out of this mode. Application may define multiple power modes and switch between them. List of defined power modes is passed to the Power Manager during initialization as an array of references to structures of this type (see [POWER_SYS_Init\(\)](#)). Power modes can be switched by calling [POWER_SYS_SetMode\(\)](#) which accepts index to the list of power modes passed during manager initialization. Currently used power mode can be retrieved by calling [POWER_SYS_GetLastMode\(\)](#), which returns index of the current power mode, or by [POWER_SYS_GetLastModeConfig\(\)](#), which returns reference to the structure of current mode. List of power mode configuration structure members depends on power options available for specific chip. Complete list contains: mode - Kinetis power mode. List of available modes is chip-specific. See [power_manager_modes_t](#) list of modes. This item is common for all Kinetis chips. sleepOnExitOption - Controls whether the sleep-on-exit option value is used (when set to true) or ignored (when set to false). See [sleepOnExitValue](#). This item is common for all Kinetis chips. sleepOnExitValue - When set to true, ARM core returns to sleep (Kinetis wait modes) or deep sleep state (Kinetis stop modes) after interrupt service finishes. When set to false, core stays woken-up. This item is common for all Kinetis chips. lowPowerWakeUpOnInterruptOption - Controls whether the wake-up-on-interrupt option value is used (when set to true) or ignored (when set to false). See [lowPowerWakeUpOnInterruptValue](#). This item is chip-specific. lowPowerWakeUpOnInterruptValue - When set to true, system exits to Run mode when any interrupt occurs while in Very low power run, Very low power wait or Very low power stop mode. This item is chip-specific. powerOnResetDetectionOption - Controls whether the power on reset detection option value is used (when set to true) or ignored (when set to false). See [powerOnResetDetectionValue](#). This item is chip-specific. powerOnResetDetectionValue - When set to true, power on reset detection circuit is enabled in Very low leakage stop 0 mode. When set to false, circuit is disabled. This item is chip-specific. RAM2PartitionOption - Controls whether the RAM2 partition power option value is used (when set to true) or ignored (when set to false). See [RAM2PartitionValue](#). This item is chip-specific. RAM2PartitionValue - When set to true, RAM2 partition content is retained through Very low leakage stop 2 mode. When set to false, RAM2 partition power is disabled and memory content lost. This item is chip-specific. lowPowerOscillatorOption - Controls whether the Low power oscillator power option value is used (when set to true) or ignored (when set to false). See [lowPowerOscillatorValue](#). This item is chip-specific. lowPowerOscillatorValue - When set to true, the 1 kHz Low power oscillator is enabled in any Low leakage or Very low leakage stop mode. When set to false, oscillator is disabled in these modes. This item is chip-specific.

Data Structure Documentation

Data Fields

- [power_manager_modes_t mode](#)
Power mode.
- bool [sleepOnExitValue](#)
true - Sleep or deep sleep after interrupt service finished, false - core stays woken-up.

55.2.2 struct power_manager_notify_struct_t

Data Fields

- uint8_t [targetPowerConfigIndex](#)
Target power configuration index.
- [power_manager_user_config_t](#) const * [targetPowerConfigPtr](#)
Pointer to target power configuration.
- [power_manager_policy_t](#) [policy](#)
Clock transition policy.
- [power_manager_notify_t](#) [notifyType](#)
Clock notification type.

55.2.2.0.0.4 Field Documentation

55.2.2.0.0.4.1 [uint8_t power_manager_notify_struct_t::targetPowerConfigIndex](#)

55.2.2.0.0.4.2 [power_manager_policy_t power_manager_notify_struct_t::policy](#)

55.2.2.0.0.4.3 [power_manager_notify_t power_manager_notify_struct_t::notifyType](#)

55.2.3 struct power_manager_callback_user_config_t

This structure holds configuration of callbacks passed to the Power Manager during its initialization. Callbacks of this type are expected to be statically allocated. This structure contains following application-defined data: `callback` - pointer to the callback function `callbackType` - specifies when the callback is called `callbackData` - pointer to the data passed to the callback.

55.2.4 struct power_manager_state_t

Power Manager internal structure. Contains data necessary for Power Manager proper function. Stores references to registered power mode configurations, callbacks, information about their numbers and other internal data. This structure is statically allocated and initialized after [POWER_SYS_Init\(\)](#) call.

Data Fields

- [power_manager_user_config_t](#)
const ** [configs](#)
Pointer to power configure table.
- [uint8_t configsNumber](#)
Number of power configurations.
- [power_manager_callback_user_config_t](#) ** [staticCallbacks](#)
Pointer to callback table.
- [uint8_t staticCallbacksNumber](#)
Maximum number of callback configurations.
- [uint8_t errorCallbackIndex](#)
Index of callback returns error.
- [uint8_t currentConfig](#)
Index of current configuration.

55.2.4.0.0.5 Field Documentation

55.2.4.0.0.5.1 [power_manager_user_config_t](#) const** [power_manager_state_t::configs](#)

55.2.4.0.0.5.2 [power_manager_callback_user_config_t](#)** [power_manager_state_t::staticCallbacks](#)

55.2.4.0.0.5.3 [uint8_t power_manager_state_t::errorCallbackIndex](#)

55.2.4.0.0.5.4 [uint8_t power_manager_state_t::currentConfig](#)

55.3 Typedef Documentation

55.3.1 typedef void [power_manager_callback_data_t](#)

Reference to data of this type is passed during callback registration. The reference is part of the [power_manager_callback_user_config_t](#) structure and is passed to the callback during power mode change notifications.

55.3.2 **typedef** [power_manager_error_code_t](#)(* [power_manager_callback_t](#))([power_manager_notify_struct_t](#) *[notify](#), [power_manager_callback_data_t](#) *[dataPtr](#))

Declaration of callback. It is common for registered callbacks. Reference to function of this type is part of [power_manager_callback_user_config_t](#) callback configuration structure. Depending on callback type, function of this prototype is called during the power mode change (see [POWER_SYS_SetMode\(\)](#)) before the mode change, after it or in both cases to notify about the change progress (see [power_manager_callback_type_t](#)). When called, type of the notification is passed as parameter along with reference to entered power mode configuration structure (see [power_manager_notify_struct_t](#)) and any data passed during the callback registration (see [power_manager_callback_data_t](#)). When notified before the mode change, depending on the power mode change policy (see [power_manager_policy_t](#)) the callback may

Enumeration Type Documentation

deny the mode change by returning any error code different from `kPowerManagerSuccess` (see [POWER-_SYS_SetMode\(\)](#)).

Parameters

| | |
|----------------|--|
| <i>notify</i> | Notification structure. |
| <i>dataPtr</i> | Callback data. Refers to the data passed during callback registration. Intended to pass any driver or application data such as internal state information. |

Returns

An error code or `kPowerManagerSuccess`.

55.4 Enumeration Type Documentation

55.4.1 `enum power_manager_modes_t`

Defines power mode. Used in the power mode configuration structure ([power_manager_user_config_t](#)). From ARM core perspective, power modes can be generally divided to run modes (high-speed run, run, and very low power run), sleep (wait and very low power wait), and deep sleep modes (all stop modes). List of power modes supported by a specific chip along with requirements for entering and exiting of these modes can be found in the chip documentation. List of all supported power modes:

- `kPowerManagerHsr` - High speed run mode. Chip-specific.
- `kPowerManagerRun` - Run mode. All Kinetis chips.
- `kPowerManagerVlpr` - Very low power run mode. All Kinetis chips.
- `kPowerManagerWait` - Wait mode. All Kinetis chips.
- `kPowerManagerVlpw` - Very low power wait mode. All Kinetis chips.
- `kPowerManagerStop` - Stop mode. All Kinetis chips.
- `kPowerManagerVlps` - Very low power stop mode. All Kinetis chips.
- `kPowerManagerPstop1` - Partial stop 1 mode. Chip-specific.
- `kPowerManagerPstop2` - Partial stop 2 mode. Chip-specific.
- `kPowerManagerLls` - Low leakage stop mode. All Kinetis chips.
- `kPowerManagerLls2` - Low leakage stop 2 mode. Chip-specific.
- `kPowerManagerLls3` - Low leakage stop 3 mode. Chip-specific.
- `kPowerManagerVlls0` - Very low leakage stop 0 mode. Chip-specific.
- `kPowerManagerVlls1` - Very low leakage stop 1 mode. All Kinetis chips.
- `kPowerManagerVlls2` - Very low leakage stop 2 mode. All Kinetis chips.
- `kPowerManagerVlls3` - Very low leakage stop 3 mode. All Kinetis chips.

Enumerator

- kPowerManagerRun*** Run mode. All Kinetis chips.
- kPowerManagerVlpr*** Very low power run mode. All Kinetis chips.
- kPowerManagerWait*** Wait mode. All Kinetis chips.
- kPowerManagerVlpw*** Very low power wait mode. All Kinetis chips.

- kPowerManagerStop* Stop mode. All Kinetis chips.
- kPowerManagerVlps* Very low power stop mode. All Kinetis chips.
- kPowerManagerVlls1* Very low leakage stop 1 mode. All Kinetis chips.
- kPowerManagerVlls3* Very low leakage stop 3 mode. All Kinetis chips.

55.4.2 enum power_manager_error_code_t

Used as return value of Power Manager functions.

Enumerator

- kPowerManagerSuccess* Success.
- kPowerManagerError* Some error occurs.
- kPowerManagerErrorOutOfRange* Configuration index out of range.
- kPowerManagerErrorSwitch* Error occurs during mode switch.
- kPowerManagerErrorNotificationBefore* Error occurs during send "BEFORE" notification.
- kPowerManagerErrorNotificationAfter* Error occurs during send "AFTER" notification.
- kPowerManagerErrorClock* Error occurs due to wrong clock setup for power modes.

55.4.3 enum power_manager_policy_t

Defines whether the power mode change is forced or not. Used to specify whether the mode switch initiated by the [POWER_SYS_SetMode\(\)](#) depends on the callback notification results. For *kPowerManagerPolicyForcible*, the power mode is changed regardless of the results, while *kPowerManagerPolicyAgreement* policy is used the [POWER_SYS_SetMode\(\)](#) is exited when any of the callbacks returns error code. See also [POWER_SYS_SetMode\(\)](#) description.

Enumerator

- kPowerManagerPolicyAgreement* [POWER_SYS_SetMode\(\)](#) method is exited when any of the callbacks returns error code.
- kPowerManagerPolicyForcible* Power mode is changed regardless of the results.

55.4.4 enum power_manager_notify_t

Used to notify registered callbacks

Enumerator

- kPowerManagerNotifyRecover* Notify IP to recover to previous work state.
- kPowerManagerNotifyBefore* Notify IP that system changes power setting.
- kPowerManagerNotifyAfter* Notify IP that have changed to new power setting.

Function Documentation

55.4.5 enum power_manager_callback_type_t

Used in the callback configuration structures ([power_manager_callback_user_config_t](#)) to specify when the registered callback is called during power mode change initiated by [POWER_SYS_SetMode\(\)](#). Callback can be invoked in following situations:

- before the power mode change (Callback return value can affect [POWER_SYS_SetMode\(\)](#) execution. Refer to the [POWER_SYS_SetMode\(\)](#) and [power_manager_policy_t](#) documentation).
- after entering one of the run modes or after exiting from one of the (deep) sleep power modes back to the run mode.
- after unsuccessful attempt to switch power mode

Enumerator

kPowerManagerCallbackBefore Before callback.

kPowerManagerCallbackAfter After callback.

kPowerManagerCallbackBeforeAfter Before-After callback.

55.5 Function Documentation

55.5.1 power_manager_error_code_t POWER_SYS_Init (power_manager_user_config_t const ** powerConfigsPtr, uint8_t configsNumber, power_manager_callback_user_config_t ** callbacksPtr, uint8_t callbacksNumber)

This function initializes the Power Manager and its run-time state structure. Reference to an array of power mode configuration structures has to be passed as a parameter along with a parameter specifying its size. At least one power mode configuration is required. Optionally, reference to the array of predefined callbacks can be passed with its size parameter. For details about callbacks, refer to the [power_manager_callback_user_config_t](#). As Power Manager stores only references to array of these structures, they have to exist while Power Manager is used. It is expected that prior to the [POWER_SYS_Init\(\)](#) call the write-once protection register was configured appropriately allowing for entry to all required low power modes. The following is an example of how to set up two power modes and three callbacks, and initialize the Power Manager with structures containing their settings. The example shows two possible ways the configuration structures can be stored (ROM or RAM), although it is expected that they are placed in the read-only memory to save the RAM space. (Note: In the example it is assumed that the programmed chip doesn't support any optional power options described in the [power_manager_user_config_t](#)) :

```
const power_manager_user_config_t waitConfig = {
    kPowerManagerVlpw,
    true,
    true,
};

const power_manager_callback_user_config_t callbackCfg0 = {
    callback0,
    kPowerManagerCallbackBefore,
    &callback_data0
};
```

```

const power_manager_callback_user_config_t callbackCfg1 = {
    callback1,
    kPowerManagerCallbackAfter,
    &callback_data1
};

const power_manager_callback_user_config_t callbackCfg2 = {
    callback2,
    kPowerManagerCallbackBeforeAfter,
    &callback_data2
};

const power_manager_callback_user_config_t * const callbacks[] = {&
    callbackCfg0, &callbackCfg1, &callbackCfg2};

void main(void)
{
    power_manager_user_config_t idleConfig;
    power_manager_user_config_t *powerConfigs[] = {&idleConfig, &waitConfig};

    idleConfig.mode = kPowerManagerVlps;
    idleConfig.sleepOnExitOption = true;
    idleConfig.sleepOnExitValue = false;

    POWER_SYS_Init(&powerConfigs, 2U, &callbacks, 3U);

    POWER_SYS_SetMode(0U, kPowerManagerPolicyAgreement);
}

```

Parameters

| | |
|-------------------------|--|
| <i>powerConfigs-Ptr</i> | A pointer to an array with references to all power configurations which is handled by the Power Manager. |
| <i>configsNumber</i> | Number of power configurations. Size of powerConfigsPtr array. |
| <i>callbacksPtr</i> | A pointer to an array with references to callback configurations. If there are no callbacks to register during Power Manager initialization, use NULL value. |
| <i>callbacks-Number</i> | Number of registered callbacks. Size of callbacksPtr array. |

Returns

An error code or kPowerManagerSuccess.

55.5.2 power_manager_error_code_t POWER_SYS_Deinit (void)

Returns

An error code or kPowerManagerSuccess.

Function Documentation

55.5.3 `power_manager_error_code_t POWER_SYS_SetMode (uint8_t powerModelIndex, power_manager_policy_t policy)`

This function switches to one of the defined power modes. Requested mode number is passed as an input parameter. This function notifies all registered callback functions before the mode change (using `kPowerManagerCallbackBefore` set as callback type parameter), sets specific power options defined in the power mode configuration and enters the specified mode. In case of run modes (for example, Run, Very low power run, or High speed run), this function also invokes all registered callbacks after the mode change (using `kPowerManagerCallbackAfter`). In case of sleep or deep sleep modes, if the requested mode is not exited through a reset, these notifications are sent after the core wakes up. Callbacks are invoked in the following order: All registered callbacks are notified ordered by index in the callbacks array (see `callbacksPtr` parameter of `POWER_SYS_Init()`). The same order is used for before and after switch notifications. The notifications before the power mode switch can be used to obtain confirmation about the change from registered callbacks. If any registered callback denies the power mode change, further execution of this function depends on mode change policy: the mode change is either forced (`kPowerManagerPolicyForcible`) or exited (`kPowerManagerPolicyAgreement`). When mode change is forced, the result of the before switch notifications are ignored. If agreement is required, if any callback returns an error code then further notifications before switch notifications are cancelled and all already notified callbacks are re-invoked with `kPowerManagerCallbackAfter` set as callback type parameter. The index of the callback which returned error code during pre-switch notifications is stored (any error codes during callbacks re-invocation are ignored) and `POWER_SYS_GetErrorCallback()` can be used to get it. Regardless of the policies, if any callback returned an error code, an error code denoting in which phase the error occurred is returned when `POWER_SYS_SetMode()` exits. It is possible to enter any mode supported by the processor. Refer to the chip reference manual for list of available power modes. If it is necessary to switch into intermediate power mode prior to entering requested mode (for example, when switching from Run into Very low power wait through Very low power run mode), then the intermediate mode is entered without invoking the callback mechanism.

Parameters

| | |
|------------------------|---|
| <i>powerModelIndex</i> | Requested power mode represented as an index into array of user-defined power mode configurations passed to the <code>POWER_SYS_Init()</code> . |
| <i>policy</i> | Transaction policy |

Returns

An error code or `kPowerManagerSuccess`.

55.5.4 `power_manager_error_code_t POWER_SYS_GetLastMode (uint8_t * powerModelIndexPtr)`

This function returns index of power mode which was set using `POWER_SYS_SetMode()` as the last one. If the power mode was entered even though some of the registered callback denied the mode change, or

if any of the callbacks invoked after the entering/restoring run mode failed, then the return code of this function has `kPowerManagerError` value.

Parameters

| | |
|--------------------------------|--|
| <i>powerMode- IndexPtr</i> | Power mode which has been set represented as an index into array of power mode configurations passed to the POWER_SYS_Init() . |
|--------------------------------|--|

Returns

An error code or `kPowerManagerSuccess`.

55.5.5 `power_manager_error_code_t POWER_SYS_GetLastModeConfig (power_manager_user_config_t const ** powerModePtr)`

This function returns reference to configuration structure which was set using [POWER_SYS_SetMode\(\)](#) as the last one. If the current power mode was entered even though some of the registered callback denied the mode change, or if any of the callbacks invoked after the entering/restoring run mode failed, then the return code of this function has `kPowerManagerError` value.

Parameters

| | |
|---------------------|--|
| <i>powerModePtr</i> | Pointer to power mode configuration structure of power mode set as last one. |
|---------------------|--|

Returns

An error code or `kPowerManagerSuccess`.

55.5.6 `power_manager_modes_t POWER_SYS_GetCurrentMode (void)`

This function reads hardware settings and returns currently running power mode. Generally, this function can return only `kPowerManagerRun`, `kPowerManagerVlpr` or `kPowerManagerHsr` value.

Returns

Currently used run power mode.

55.5.7 `uint8_t POWER_SYS_GetErrorCallbackIndex (void)`

This function returns index of the last callback that failed during the power mode switch while the last [POWER_SYS_SetMode\(\)](#) was called. If the last [POWER_SYS_SetMode\(\)](#) call ended successfully value equal to callbacks number is returned. Returned value represents index in the array of static call-backs.

Function Documentation

Returns

Callback index of last failed callback or value equal to callbacks count.

55.5.8 `power_manager_callback_user_config_t* POWER_SYS_GetErrorCallback (void)`

This function returns pointer to configuration structure of the last callback that failed during the power mode switch while the last `POWER_SYS_SetMode()` was called. If the last `POWER_SYS_SetMode()` call ended successfully value NULL is returned.

Returns

Pointer to the callback configuration which returns error.

55.5.9 `bool POWER_SYS_GetVeryLowPowerModeStatus (void)`

This function is used to detect whether very low power mode is running.

Returns

Returns true if processor runs in very low power mode, otherwise false.

55.5.10 `bool POWER_SYS_GetLowLeakageWakeupResetStatus (void)`

This function is used to check that processor exited low leakage power mode through reset.

Returns

Returns true if processor was reset by low leakage wake up, otherwise false.

55.5.11 `bool POWER_SYS_GetAckIsolation (void)`

This function is used to check certain peripherals and the I/O pads are in a latched state as a result of having been in a VLLS mode.

After recovery from VLLS, the LLWU continues to detect wake-up events until the user has acknowledged the wake-up via `POWER_SYS_ClearAckIsolation()`

Returns

Returns true if ACK isolation is set.

55.5.12 void POWER_SYS_ClearAckIsolation (void)

This function clears the ACK Isolation flag. Clearing releases the I/O pads and certain peripherals to their normal run mode state.

After recovery from VLLS, the LLWU continues to detect wake-up events until the user has acknowledged the wake-up via [POWER_SYS_ClearAckIsolation\(\)](#)

Power Manager driver

55.6 Power Manager driver

Low Power Manager provides API to handle the device power modes. It also supports run-time switching between multiple power modes. Each power mode is described by configuration structures with multiple power-related options. Low Power Manager provides a notification mechanism for registered callbacks and API for static and dynamic callback registration.

55.6.1 Power Manager Overview

The Power Manager driver is developed on top of the SMC HAL, PMC HAL, and RCM HAL.

This is an example to initialize the Power Manager:

```
~~~~~{.c}

#include "fsl_power_manager.h"

/* Definition of power manager callback
power_manager_error_code_t callback0(power_manager_callback_type_t type,
    power_manager_user_config_t * configPtr,
    power_manager_callback_data_t * dataPtr)
{

    power_manager_error_code_t ret = kPowerManagerError;

    ...
    ...
    ...

    return ret;
}

...
...
...
...
...
/* Main function
int main(void)
{
    /* Callback configuration
    user_callback_data_t callbackData0;

    power_manager_static_callback_user_config_t callbackCfg0 = { callback0,
        kPowerManagerCallbackBeforeAfter,
        (power_manager_callback_data_t*) &callbackData0 };

    power_manager_static_callback_user_config_t * callbacks[] =
        { &callbackCfg0 };
```

```

/* Power modes configurations
power_manager_user_config_t vlprConfig;
power_manager_user_config_t stopConfig;

power_manager_user_config_t *powerConfigs[] = {&vlprConfig, &stopConfig};

/* Definition of transition to and out these power modes
vlprConfig.mode = kPowerManagerVlpr;
vlprConfig.policy = kPowerManagerPolicyAgreement;
vlprConfig.sleepOnExitValue = false;
vlprConfig.sleepOnExitOption = false;

stopConfig = vlprConfig;
stopConfig.mode = kPowerManagerStop;

/* Calling of init method
POWER_SYS_Init(&powerConfigs, 2U, &callbacks, 1U);
}

~~~~~{.c}

```

This is an example to switch into a desired power mode:

```

~~~~~{.c}

#include "fsl_power_manager.h"

/* Index into array containing configuration of very low power run mode - vlpr
#define MODE_VLPR 0U

/* Initialization
power_manager_user_config_t vlprConfig;
...
...
power_manager_user_config_t *powerConfigs[1] = {&vlprConfig};

/* Switch to required power mode
power_manager_error_code_t ret = POWER_SYS_SetMode(MODE_VLPR);

if (ret != kPowerManagerSuccess)
{
    printf("POWER_SYS_SetMode(powerMode5) returns : %u\n\r",ret);
}

~~~~~{.c}

```

Chapter 56

Pulse Width Modulator A (PWMA/eFlexPWM)

56.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the eFlexPWM (PWMA/eFlexPWM) block of Kinetis devices.

Modules

- [eFlexPWM HAL Driver](#)
- [eFlexPWM Peripheral Driver](#)

eFlexPWM HAL Driver

56.2 eFlexPWM HAL Driver

56.2.1 Overview

The section describes the programming interface of the eFlexPWM HAL driver.

Data Structures

- struct [pwm_module_setup_t](#)
Structure is used to hold the parameters to configure a PWM module. [More...](#)
- struct [pwm_fault_setup_t](#)
Structure is used to hold the parameters to configure a PWM fault. [More...](#)
- struct [pwm_capture_setup_t](#)
Structure is used to hold parameters to configure the capture capability of a signal pin. [More...](#)

Enumerations

- enum [pwm_module_t](#) {
 [kFlexPwmModule0](#) = 0U,
 [kFlexPwmModule1](#),
 [kFlexPwmModule2](#),
 [kFlexPwmModule3](#) }
PWM submodules.
- enum [pwm_module_signal_t](#)
PWM signals from each module.
- enum [pwm_val_regs_t](#) {
 [kFlexPwmVAL0](#) = 0U,
 [kFlexPwmVAL1](#),
 [kFlexPwmVAL2](#),
 [kFlexPwmVAL3](#),
 [kFlexPwmVAL4](#),
 [kFlexPwmVAL5](#) }
PWM value registers.
- enum [pwm_status_t](#) {
 [kStatusPwmSuccess](#) = 0U,
 [kStatusPwmError](#) = 1U,
 [kStatusPwmInvalidArgument](#) = 2U }
PWM status.
- enum [pwm_clock_src_t](#) {
 [kClkSrcPwmIPBusClk](#) = 0U,
 [kClkSrcPwmExtClk](#),
 [kClkSrcPwm0Clk](#) }
PWM clock source selection.
- enum [pwm_clock_ps_t](#) {

```

kPwmDividedBy1 = 0U,
kPwmDividedBy2,
kPwmDividedBy4,
kPwmDividedBy8,
kPwmDividedBy16,
kPwmDividedBy32,
kPwmDividedBy64,
kPwmDividedBy128 }
    
```

PWM prescaler factor selection for clock source.

- enum `pwm_force_output_trigger_t` {

```

kForceOutputLocalForce = 0U,
kForceOutputMasterForce,
kForceOutputLocalReload,
kForceOutputMasterReload,
kForceOutputLocalSync,
kForceOutputMasterSync,
kForceOutputExternalForce,
kForceOutputExternalSync }
            
```

Options that can trigger a PWM FORCE_OUT.

- enum `pwm_init_src_t` {

```

kInitSrcLocalSync = 0U,
kInitSrcMasterReload,
kInitSrcMasterSync,
kInitSrcExtSync }
            
```

PWM counter initialization options.

- enum `pwm_load_frequency_t` {

```

kPwmLoadEvery1Opportunity = 0U,
kPwmLoadEvery2Opportunity,
kPwmLoadEvery3Opportunity,
kPwmLoadEvery4Opportunity,
kPwmLoadEvery5Opportunity,
kPwmLoadEvery6Opportunity,
kPwmLoadEvery7Opportunity,
kPwmLoadEvery8Opportunity,
kPwmLoadEvery9Opportunity,
kPwmLoadEvery10Opportunity,
kPwmLoadEvery11Opportunity,
kPwmLoadEvery12Opportunity,
kPwmLoadEvery13Opportunity,
kPwmLoadEvery14Opportunity,
kPwmLoadEvery15Opportunity,
kPwmLoadEvery16Opportunity }
            
```

PWM load frequency selection.

- enum `pwm_fault_input_t` {

eFlexPWM HAL Driver

```
kFlexPwmFault0 = 0U,  
kFlexPwmFault1,  
kFlexPwmFault2,  
kFlexPwmFault3 }
```

PWM fault select.

- enum `pwm_capture_edge_t` {
`kCaptureDisable` = 0U,
`kCaptureFallingEdges`,
`kCaptureRisingEdges`,
`kCaptureAnyEdges` }

PWM capture edge select.

- enum `pwm_force_signal_t` {
`kFlexPwmUsePwm` = 0U,
`kFlexPwmInvertedPwm`,
`kFlexPwmSoftwareControl`,
`kFlexPwmUseExternal` }

PWM output options when a FORCE_OUT signal is asserted.

- enum `pwm_chnl_pair_operation_t` {
`kFlexPwmIndependent` = 0U,
`kFlexPwmComplementaryPwmA`,
`kFlexPwmComplementaryPwmB` }

Options available for the PWM A & B pair operation.

- enum `pwm_reg_reload_t` {
`kFlexPwmReloadImmediate` = 0U,
`kFlexPwmReloadPwmHalfCycle`,
`kFlexPwmReloadPwmFullCycle`,
`kFlexPwmReloadPwmHalfAndFullCycle` }

Options available on how to load the buffered-registers with new values.

- enum `pwm_fault_recovery_mode_t` {
`kFlexPwmNoRecovery` = 0U,
`kFlexPwmRecoverHalfCycle`,
`kFlexPwmRecoverFullCycle`,
`kFlexPwmRecoverHalfAndFullCycle` }

Options available on how to re-enable the PWM output when recovering from a fault.

- enum `pwm_event_t` {

```

kFlexPwmCompareVal0Event = (1U << 0),
kFlexPwmCompareVal1Event = (1U << 1),
kFlexPwmCompareVal2Event = (1U << 2),
kFlexPwmCompareVal3Event = (1U << 3),
kFlexPwmCompareVal4Event = (1U << 4),
kFlexPwmCompareVal5Event = (1U << 5),
kFlexPwmCaptureX0Event = (1U << 6),
kFlexPwmCaptureX1Event = (1U << 7),
kFlexPwmCaptureB0Event = (1U << 8),
kFlexPwmCaptureB1Event = (1U << 9),
kFlexPwmCaptureA0Event = (1U << 10),
kFlexPwmCaptureA1Event = (1U << 11),
kFlexPwmReloadEvent = (1U << 12),
kFlexPwmReloadErrorEvent = (1U << 13),
kFlexPwmFault0Event = (1U << 16),
kFlexPwmFault1Event = (1U << 17),
kFlexPwmFault2Event = (1U << 18),
kFlexPwmFault3Event = (1U << 19) }
    
```

PWM interrupt options available.

Functions

- void **PWM_HAL_Init** (PWM_Type *base)
Initializes the PWM to its reset state.
- void **PWM_HAL_SetupPwmSubModule** (PWM_Type *base, **pwm_module_t** subModuleNum, **pwm_module_setup_t** *setupParams)
Sets up a PWM sub-module.
- void **PWM_HAL_SetupFaults** (PWM_Type *base, **pwm_fault_input_t** faultNum, **pwm_fault_setup_t** *setupParams)
Sets up the Flex PWM fault protection.
- void **PWM_HAL_SetupCapture** (PWM_Type *base, **pwm_module_t** subModuleNum, **pwm_module_signal_t** pwmSignal, **pwm_capture_setup_t** *setupParams)
Sets up the Flex PWM capture.s.
- uint16_t **PWM_HAL_GetCaptureValReg** (PWM_Type *base, **pwm_module_t** subModuleNum, **pwm_val_regs_t** cmpReg)
Gets the PWM capture value.
- void **PWM_HAL_SetValReg** (PWM_Type *base, uint8_t subModuleNum, **pwm_val_regs_t** valReg, uint16_t val)
Sets the PWM value register.
- void **PWM_HAL_SetupForceSignal** (PWM_Type *base, **pwm_module_t** subModuleNum, **pwm_module_signal_t** pwmSignal, **pwm_force_signal_t** mode)
Selects the signal to output when a FORCE_OUT signal is asserted.
- void **PWM_HAL_EnableInterrupts** (PWM_Type *base, **pwm_module_t** subModuleNum, uint32_t eventmask)
Enables all relevant PWM interrupts.
- void **PWM_HAL_DisableInterrupts** (PWM_Type *base, **pwm_module_t** subModuleNum, uint32_t

56.2.2 Data Structure Documentation

56.2.2.1 struct pwm_module_setup_t

Data Fields

- [pwm_init_src_t ctrInitSel](#)
Option to initialize the counter.
- [pwm_clock_src_t clkSrc](#)
Clock source for the counter.
- [pwm_clock_ps_t prescale](#)
Pre-scaler to divide down the clock.
- [pwm_chnl_pair_operation_t chnlPairOper](#)
Channel pair in independent or complementary mode.
- [pwm_reg_reload_t reloadLogic](#)
PWM Reload logic setup.
- [pwm_load_frequency_t reloadFreq](#)
Specifies when to reload, used when user's choice is not immediate reload.
- [pwm_force_output_trigger_t forceTrig](#)
Specify which signal will trigger a FORCE_OUT.

56.2.2.2 struct pwm_fault_setup_t

Data Fields

- bool [automaticClearing](#)
true: Use automatic fault clearing; false: Manual fault clearing.
- bool [faultLevel](#)
true: Logic 1 indicates fault; false: Logic 0 indicates fault.
- bool [useFaultFilter](#)
true: Use the filtered fault signal; false: Use the direct path from fault input.
- [pwm_fault_recovery_mode_t recMode](#)
Specify when to re-enable the PWM output.

56.2.2.3 struct pwm_capture_setup_t

Data Fields

- bool [captureInputSel](#)
true: Use the edge counter signal as source false: Use the raw input signal from the pin as source
- [uint8_t edgeCompareVal](#)
Compare value, used only if edge counter is used as source.
- [pwm_capture_edge_t edge0](#)
Specify which edge causes a capture for input circuitry 0.
- [pwm_capture_edge_t edge1](#)
Specify which edge causes a capture for input circuitry 1.
- bool [oneShotCapture](#)
true: Use one-shot capture mode; false: Use free-running capture mode

56.2.3 Enumeration Type Documentation

56.2.3.1 enum pwm_module_t

Enumerator

- kFlexPwmModule0* Sub-module 0.
- kFlexPwmModule1* Sub-module 1.
- kFlexPwmModule2* Sub-module 2.
- kFlexPwmModule3* Sub-module 3.

56.2.3.2 enum pwm_val_regs_t

Enumerator

- kFlexPwmVAL0* PWM VAL0 reg.
- kFlexPwmVAL1* PWM VAL1 reg.
- kFlexPwmVAL2* PWM VAL2 reg.
- kFlexPwmVAL3* PWM VAL3 reg.
- kFlexPwmVAL4* PWM VAL4 reg.
- kFlexPwmVAL5* PWM VAL5 reg.

56.2.3.3 enum pwm_status_t

Enumerator

- kStatusPwmSuccess* PWM success status.
- kStatusPwmError* PWM error status.
- kStatusPwmInvalidArgument* PWM invalid argument.

56.2.3.4 enum pwm_clock_src_t

Enumerator

- kClkSrcPwmIPBusClk* The IPBus clock is used as the clock.
- kClkSrcPwmExtClk* EXT_CLK is used as the clock.
- kClkSrcPwm0Clk* Clock of the submodule 0 (AUX_CLK) is used as the source clock.

56.2.3.5 enum pwm_clock_ps_t

Enumerator

- kPwmDividedBy1* PWM clock frequency = fclk/1.

- kPwmDividedBy2*** PWM clock frequency = fclk/2.
- kPwmDividedBy4*** PWM clock frequency = fclk/4.
- kPwmDividedBy8*** PWM clock frequency = fclk/8.
- kPwmDividedBy16*** PWM clock frequency = fclk/16.
- kPwmDividedBy32*** PWM clock frequency = fclk/32.
- kPwmDividedBy64*** PWM clock frequency = fclk/64.
- kPwmDividedBy128*** PWM clock frequency = fclk/128.

56.2.3.6 enum pwm_force_output_trigger_t

Enumerator

- kForceOutputLocalForce*** The local force signal, CTRL2[FORCE], from this submodule is used to force updates.
- kForceOutputMasterForce*** The master force signal from submodule 0 is used to force updates.
- kForceOutputLocalReload*** The local reload signal from this submodule is used to force updates without regard to the state of LDOK.
- kForceOutputMasterReload*** The master reload signal from submodule 0 is used to force updates if LDOK is set.
- kForceOutputLocalSync*** The local sync signal from this submodule is used to force updates.
- kForceOutputMasterSync*** The master sync signal from submodule 0 is used to force updates.
- kForceOutputExternalForce*** The external force signal, EXT_FORCE, from outside the PWM module causes updates.
- kForceOutputExternalSync*** The external sync signal, EXT_SYNC, from outside the PWM module causes updates.

56.2.3.7 enum pwm_init_src_t

Enumerator

- kInitSrcLocalSync*** Local sync (PWM_X) causes initialization.
- kInitSrcMasterReload*** Master reload from submodule 0 causes initialization.
- kInitSrcMasterSync*** Master sync from submodule 0 causes initialization.
- kInitSrcExtSync*** EXT_SYNC causes initialization.

56.2.3.8 enum pwm_load_frequency_t

Enumerator

- kPwmLoadEvery1Opportunity*** Every 1 PWM opportunity.
- kPwmLoadEvery2Opportunity*** Every 2 PWM opportunities.
- kPwmLoadEvery3Opportunity*** Every 3 PWM opportunities.
- kPwmLoadEvery4Opportunity*** Every 4 PWM opportunities.

eFlexPWM HAL Driver

kPwmLoadEvery5Opportunity Every 5 PWM opportunities.
kPwmLoadEvery6Opportunity Every 6 PWM opportunities.
kPwmLoadEvery7Opportunity Every 7 PWM opportunities.
kPwmLoadEvery8Opportunity Every 8 PWM opportunities.
kPwmLoadEvery9Opportunity Every 9 PWM opportunities.
kPwmLoadEvery10Opportunity Every 10 PWM opportunities.
kPwmLoadEvery11Opportunity Every 11 PWM opportunities.
kPwmLoadEvery12Opportunity Every 12 PWM opportunities.
kPwmLoadEvery13Opportunity Every 13 PWM opportunities.
kPwmLoadEvery14Opportunity Every 14 PWM opportunities.
kPwmLoadEvery15Opportunity Every 15 PWM opportunities.
kPwmLoadEvery16Opportunity Every 16 PWM opportunities.

56.2.3.9 enum pwm_fault_input_t

Enumerator

kFlexPwmFault0 Fault 0 input pin.
kFlexPwmFault1 Fault 1 input pin.
kFlexPwmFault2 Fault 2 input pin.
kFlexPwmFault3 Fault 3 input pin.

56.2.3.10 enum pwm_capture_edge_t

Enumerator

kCaptureDisable Disabled.
kCaptureFallingEdges Capture falling edges.
kCaptureRisingEdges Capture rising edges.
kCaptureAnyEdges Capture any edge.

56.2.3.11 enum pwm_force_signal_t

Enumerator

kFlexPwmUsePwm Generated PWM signal is used by the deadtime logic.
kFlexPwmInvertedPwm Inverted PWM signal is used by the deadtime logic.
kFlexPwmSoftwareControl Software controlled value is used by the deadtime logic.
kFlexPwmUseExternal PWM_EXT_A signal is used by the deadtime logic.

56.2.3.12 enum pwm_chnl_pair_operation_t

Enumerator

- kFlexPwmIndependent* PWM A & PWM B operation as 2 independent channels.
- kFlexPwmComplementaryPwmA* PWM A & PWM B are complementary channels, PWM A generates the signal.
- kFlexPwmComplementaryPwmB* PWM A & PWM B are complementary channels, PWM B generates the signal.

56.2.3.13 enum pwm_reg_reload_t

Enumerator

- kFlexPwmReloadImmediate* Buffered-registers get loaded with new values as soon as LDOK bit is set.
- kFlexPwmReloadPwmHalfCycle* Registers loaded on a PWM half cycle.
- kFlexPwmReloadPwmFullCycle* Registers loaded on a PWM full cycle.
- kFlexPwmReloadPwmHalfAndFullCycle* Registers loaded on a PWM half & full cycle.

56.2.3.14 enum pwm_fault_recovery_mode_t

Enumerator

- kFlexPwmNoRecovery* PWM output will stay inactive.
- kFlexPwmRecoverHalfCycle* PWM output re-enabled at the first half cycle.
- kFlexPwmRecoverFullCycle* PWM output re-enabled at the first full cycle.
- kFlexPwmRecoverHalfAndFullCycle* PWM output re-enabled at the first half or full cycle.

56.2.3.15 enum pwm_event_t

Enumerator

- kFlexPwmCompareVal0Event* PWM VAL0 compare event.
- kFlexPwmCompareVal1Event* PWM VAL1 compare event.
- kFlexPwmCompareVal2Event* PWM VAL2 compare event.
- kFlexPwmCompareVal3Event* PWM VAL3 compare event.
- kFlexPwmCompareVal4Event* PWM VAL4 compare event.
- kFlexPwmCompareVal5Event* PWM VAL5 compare event.
- kFlexPwmCaptureX0Event* PWM capture X0 event.
- kFlexPwmCaptureX1Event* PWM capture X1 event.
- kFlexPwmCaptureB0Event* PWM capture B0 event.
- kFlexPwmCaptureB1Event* PWM capture B1 event.

eFlexPWM HAL Driver

- kFlexPwmCaptureA0Event* PWM capture A0 event.
- kFlexPwmCaptureA1Event* PWM capture A1 event.
- kFlexPwmReloadEvent* PWM reload event.
- kFlexPwmReloadErrorEvent* PWM reload error event.
- kFlexPwmFault0Event* PWM fault 0 event.
- kFlexPwmFault1Event* PWM fault 1 event.
- kFlexPwmFault2Event* PWM fault 2 event.
- kFlexPwmFault3Event* PWM fault 3 event.

56.2.4 Function Documentation

56.2.4.1 void PWM_HAL_Init (PWM_Type * *base*)

Set the control registers to their reset state

Parameters

| | |
|-------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
|-------------|---|

56.2.4.2 void PWM_HAL_SetupPwmSubModule (PWM_Type * *base*, pwm_module_t *subModuleNum*, pwm_module_setup_t * *setupParams*)

Flex PWM has 4 sub-modules. This function sets up the key features that configure each sub-module. This function sets up the following:

1. Clock source and clock prescaler
2. Submodules PWM A & PWM B signals operation (independent or complementary)
3. Reload logic to use and reload frequency
4. Force trigger to use to generate the FORCE_OUT signal.

Parameters

| | |
|----------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>setupParams</i> | Parameters passed in to set up the submodule |

56.2.4.3 void PWM_HAL_SetupFaults (PWM_Type * *base*, pwm_fault_input_t *faultNum*, pwm_fault_setup_t * *setupParams*)

Flex PWM has 4 fault inputs. This function sets up each fault as follows:

1. Fault automatic clearing function

2. Sets up the fault level
3. Defines if the fault filter should be used for this fault input
4. Recovery mode to be used to re-enable the PWM output

Parameters

| | |
|--------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>faultNum</i> | is a number of the PWM fault to configure. |
| <i>setupParams</i> | Parameters passed in to set up the fault |

56.2.4.4 void PWM_HAL_SetupCapture (PWM_Type * *base*, pwm_module_t *subModuleNum*, pwm_module_signal_t *pwmSignal*, pwm_capture_setup_t * *setupParams*)

Each PWM submodule has 3 pins can be configured to use for capture. This function sets up the capture for each pin as follows:

1. Whether to use the edge counter or raw input
2. Edge capture mode
3. One-shot or continuous

Parameters

| | |
|----------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>pwmSignal</i> | Which signal in the submodule to setup |
| <i>setupParams</i> | Parameters passed in to set up the input pin |

56.2.4.5 uint16_t PWM_HAL_GetCaptureValReg (PWM_Type * *base*, pwm_module_t *subModuleNum*, pwm_val_regs_t *cmpReg*)

Reads one of the 6 capture value registers.

Parameters

| | |
|-------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
|-------------|---|

eFlexPWM HAL Driver

| | |
|----------------------|--|
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>cmpReg</i> | is a number of value compare register to get |

Returns

PWM value register

56.2.4.6 void PWM_HAL_SetValReg (PWM_Type * *base*, uint8_t *subModuleNum*, pwm_val_regs_t *valReg*, uint16_t *val*)

Sets one of the 6 value registers.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>valReg</i> | is the number of the value register to be set |
| <i>val</i> | is a number of value to write |

56.2.4.7 void PWM_HAL_SetupForceSignal (PWM_Type * *base*, pwm_module_t *subModuleNum*, pwm_module_signal_t *pwmSignal*, pwm_force_signal_t *mode*)

The user specifies which pin to configure by supplying the submodule number and whether to modify the PWM A or the PWM B within that submodule.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>pwmSignal</i> | specifies which signal to work with in the module |
| <i>mode</i> | signal to output when a FORCE_OUT is triggered |

56.2.4.8 void PWM_HAL_EnableInterrupts (PWM_Type * *base*, pwm_module_t *subModuleNum*, uint32_t *eventmask*)

The user can pass in an OR'ed list of PWM interrupts to enable. The list of PWM interrupts is available in the enum pwm_event_t.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>eventmask</i> | OR'ed list of interrupts to enable |

56.2.4.9 void PWM_HAL_DisableInterrupts (PWM_Type * *base*, pwm_module_t *subModuleNum*, uint32_t *eventmask*)

The user can pass in an OR'ed list of PWM interrupts to disable. The list of PWM interrupts is available in the enum pwm_event_t.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>eventmask</i> | OR'ed list of interrupts to disable |

56.2.4.10 void PWM_HAL_ClearStatus (PWM_Type * *base*, pwm_module_t *subModuleNum*, uint32_t *eventmask*)

The user can pass in an OR'ed list of status flags to clear. The list of PWM interrupts is available in the enum pwm_event_t.

Parameters

eFlexPWM HAL Driver

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>eventmask</i> | OR'ed list of status flags to clear |

56.2.4.11 `static uint16_t PWM_HAL_GetCounter (PWM_Type * base, pwm_module_t subModuleNum) [inline], [static]`

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |

Returns

current PWM counter value

56.2.4.12 `static void PWM_HAL_SetCounterInitVal (PWM_Type * base, pwm_module_t subModuleNum, uint16_t val) [inline], [static]`

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>val</i> | initial value to be set |

56.2.4.13 `static void PWM_HAL_SetForceCmd (PWM_Type * base, pwm_module_t subModuleNum, bool val) [inline], [static]`

This function enables/disables the force initialization logic and asserts/deasserts the FORCE signal.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>val</i> | true to enable, false to disable. |

56.2.4.14 `static void PWM_HAL_SetOutputPolarityPwmBCmd (PWM_Type * base, pwm_module_t subModuleNum, bool val) [inline], [static]`

Parameters

| | |
|----------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>val</i> | true to set inverted output, false to set non inverted output. |

56.2.4.15 `static void PWM_HAL_SetOutputPolarityPwmACmd (PWM_Type * base, pwm_module_t subModuleNum, bool val) [inline], [static]`

Parameters

| | |
|----------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>val</i> | true to set inverted output, false to set non inverted output. |

56.2.4.16 `static void PWM_HAL_SetOutputPolarityPwmXCmd (PWM_Type * base, pwm_module_t subModuleNum, bool val) [inline], [static]`

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |

eFlexPWM HAL Driver

| | |
|------------|--|
| <i>val</i> | true to set inverted output, false to set non inverted output. |
|------------|--|

**56.2.4.17 static void PWM_HAL_SetOutputTriggerCmd (PWM_Type * *base*,
pwm_module_t *subModuleNum*, uint8_t *valueReg*, bool *val*) [inline],
[static]**

There are 2 triggers available per PWM submodule. This function allows the user to activate a trigger when the counter matches one of the 6 value registers. Enabling VAL0, VAL2, or VAL4 outputs a trigger on a match on TRIG0. Enabling VAL1, VAL3, VAL5 outputs a trigger on a match on TRIG1.

Parameters

| | |
|----------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>valueReg</i> | register that is the cause for the output trigger. |
| <i>val</i> | true to trigger enable, false to disable. |

**56.2.4.18 static void PWM_HAL_SetPwmAFaultInputCmd (PWM_Type * *base*,
pwm_module_t *subModuleNum*, pwm_fault_input_t *fault*, bool *val*)
[inline], [static]**

Enabling the specified fault causes the PWM A signal to deactivate when the fault occurs. The user should configure the PWM faults by calling the [PWM_HAL_SetupFaults\(\)](#) function prior to enabling them in the submodules.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>fault</i> | number, options: 0,1,2,3 . |
| <i>val</i> | true to enable the fault input, false to disable fault input. |

**56.2.4.19 static void PWM_HAL_SetPwmBFaultInputCmd (PWM_Type * *base*,
pwm_module_t *subModuleNum*, pwm_fault_input_t *fault*, bool *val*)
[inline], [static]**

Enabling the specified fault causes the PWM B signal to deactivate when the fault occurs. The user should configure the PWM faults by calling the [PWM_HAL_SetupFaults\(\)](#) function prior to enabling them in the submodules.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>fault</i> | number, options: 0,1,2,3 . |
| <i>val</i> | true to enable the fault input, false to disable fault input. |

**56.2.4.20 static void PWM_HAL_SetPwmXFaultInputCmd (PWM_Type * *base*,
pwm_module_t *subModuleNum*, pwm_fault_input_t *fault*, bool *val*)
[inline], [static]**

Enabling the specified fault causes the PWM X signal to deactivate when the fault occurs. The user should configure the PWM faults by calling the [PWM_HAL_SetupFaults\(\)](#) function prior to enabling them in the submodules.

Parameters

| | |
|----------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>fault</i> | number, options: 0,1,2,3. |
| <i>val</i> | true to enable the fault input; false to disable the fault input |

**56.2.4.21 static void PWM_HAL_SetOutputPwmXCmd (PWM_Type * *base*,
pwm_module_t *subModuleNum*, bool *val*) [inline], [static]**

Parameters

eFlexPWM HAL Driver

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | Number of the PWM submodule. |
| <i>val</i> | true to make the pin as output output, false to make the pin as input |

56.2.4.22 `static void PWM_HAL_SetOutputPwmBCmd (PWM_Type * base, pwm_module_t subModuleNum, bool val) [inline], [static]`

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | Number of the PWM submodule. |
| <i>val</i> | true to make the pin as output output, false to make the pin as input |

56.2.4.23 `static void PWM_HAL_SetOutputPwmACmd (PWM_Type * base, pwm_module_t subModuleNum, bool val) [inline], [static]`

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | Number of the PWM submodule. |
| <i>val</i> | true to make the pin as output output, false to make the pin as input |

56.2.4.24 `static void PWM_HAL_SetSwCtrlOutCmd (PWM_Type * base, pwm_module_t subModuleNum, pwm_module_signal_t output, bool val) [inline], [static]`

The user specifies which signal to modify by supplying the submodule number and whether to modify the PWM A or the PWM B within that submodule.

Parameters

| | |
|----------------------|---|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModule-Num</i> | is a number of the PWM submodule. |
| <i>output</i> | specifies which signal to work with in the module, 0 is PWM B, 1 is PWM A |
| <i>val</i> | true to supply a logic 1, false to supply a logic 0. |

56.2.4.25 static void PWM_HAL_SetPwmRunCmd (PWM_Type * *base*, uint8_t *subModules*, bool *val*) [inline], [static]

Parameters

| | |
|-------------------|--|
| <i>base</i> | Base address pointer of eflexPWM module |
| <i>subModules</i> | represented by corresponded bits. |
| <i>val</i> | true to run selected subModuleNums, false to stop selected subModuleNums output. |

eFlexPWM Peripheral Driver

56.3 eFlexPWM Peripheral Driver

56.3.1 Overview

The section describes the programming interface of the eFlexPWM Peripheral driver. The Pulse Width Modulator A (PWMA/eFlexPWM) module contains PWM sub modules, each of which is set up to control a single half-bridge power stage. Fault channel support is provided. This PWM module can generate various switching patterns, including highly sophisticated waveforms. It can be used to control all known Switched Mode Power Supplies (SMPS) topologies.

56.3.2 Initialization

To initialize the PWM driver, call the [PWM_DRV_Init\(\)](#) function and pass the instance and sub module numbers of the relevant PWM. For instance, to use PWM0, pass a value of 0 to the initialization function. In addition, you should also pass a user configuration structure `pwm_user_config_t`, as shown here:

```
// PWM configuration structure for user
typedef struct PwmUserConfig {
    uint8_t Clock;
    uint8_t OutputTrigger;
    uint8_t Polarity;
    bool isFaultEnable;
} pwm_user_config_t;
```

56.3.3 Generate a PWM signal

The PWM calls the [PWM_DRV_PwmStart\(\)](#) function to generate a PWM signal. Use this structure to configure different parameters related to this PWM signal:

```
typedef struct FtmPwmParam
typedef struct PwmParam
{
    uint32_t uFrequencyHZ;
```

HAS TO BE UPDATED The mode options are `kFtmEdgeAlignedPWM`, `kFtmCenterAlignedPWM` and `kFtmCombinedPWM`. For edge mode, the options available are `kFtmHighTrue` and `kFtmLowTrue`. Specify the PWM signal frequency in Hertz and the duty cycle percentage (value between 0-100). When the PWM mode is `kFtmCombinedPWM`, specify a value for `uFirstEdgeDelayPercent` which delays the start of the PWM pulse.

Data Structures

- struct [pwm_module_signal_setup_t](#)
Configuration structure for the user to define the PWM signal characteristics. [More...](#)

Macros

- #define **FLEXPWM_NO_PWM_OUT_SIGNAL** (0)
Used to indicate that a particular pin in the submodule does NOT output a PWM signal.

Enumerations

- enum **pwm_signal_type_t** {
 kFlexPwmSignedCenterAligned = 0U,
 kFlexPwmCenterAligned,
 kFlexPwmSignedEdgeAligned,
 kFlexPwmEdgeAligned }
PWM Signal Type options.

Functions

- **pwm_status_t PWM_DRV_Init** (uint32_t instance)
Initializes the PWM module.
- void **PWM_DRV_Deinit** (uint32_t instance)
Shuts down the PWM driver.
- **pwm_status_t PWM_DRV_SetupPwm** (uint32_t instance, **pwm_module_t** subModule, **pwm_module_setup_t** *moduleSetupParams, **pwm_module_signal_setup_t** *signalParams)
Sets up the PWM signals from the FlewPWM module.
- void **PWM_DRV_UpdatePwmSignal** (uint32_t instance, **pwm_module_t** subModule, **pwm_module_signal_setup_t** *signalParams)
Updates the PWM signal settings.
- void **PWM_DRV_SetTriggerCmd** (uint32_t instance, **pwm_module_t** subModule, **pwm_val_regs_t** trigger, bool activate)
Enables or disables the PWM output trigger.
- void **PWM_DRV_SetTriggerVal** (uint32_t instance, **pwm_module_t** subModule, **pwm_val_regs_t** trigger, uint16_t triggerVal)
Sets the PWM trigger value.
- void **PWM_DRV_SetupFault** (uint32_t instance, **pwm_module_t** subModule, **pwm_fault_input_t** faultNum, **pwm_fault_setup_t** *faultParams, bool pwmA, bool pwmB, bool pwmX)
Sets up the PWM fault.
- void **PWM_DRV_CounterStart** (uint32_t instance, uint8_t value)
Starts the PWM counter.
- void **PWM_DRV_CounterStop** (uint32_t instance, uint8_t value)
Stops the PWM counter.
- void **PWM_DRV_SetExternalClkFreq** (uint32_t instance, uint32_t externalClkFreq)
Provides the frequency of the external clock source.

Variables

- **PWM_Type** *const **g_pwmBase** [PWM_INSTANCE_COUNT]
Table of base addresses for PWM instances.

eFlexPWM Peripheral Driver

- const IRQn_Type [g_pwmCmpIrqId](#) [FSL_FEATURE_PWM_CMP_INT_HANDLER_COUNT]
Table to save PWM IRQ enumeration numbers defined in CMSIS header file.

56.3.4 Data Structure Documentation

56.3.4.1 struct pwm_module_signal_setup_t

Data Fields

- uint32_t [pwmPeriod](#)
PWM period specified in microseconds.
- [pwm_signal_type_t](#) [pwmType](#)
PWM type, edge or center; signed or unsigned.
- uint32_t [pwmAPulseWidth](#)
PWM A pulse width specified in microseconds.
- uint32_t [pwmBPulseWidth](#)
PWM B pulse width specified in microseconds.
- bool [pwmAPolarity](#)
true: if output is to be inverted; false: if no output inversion.
- bool [pwmBPolarity](#)
true: if output is to be inverted; false: if no output inversion.

56.3.4.1.0.6 Field Documentation

56.3.4.1.0.6.1 uint32_t pwm_module_signal_setup_t::pwmAPulseWidth

Specify FLEXPWM_NO_PWM_OUT_SIGNAL if no PWM output on this pin.

56.3.4.1.0.6.2 uint32_t pwm_module_signal_setup_t::pwmBPulseWidth

Specify FLEXPWM_NO_PWM_OUT_SIGNAL if no PWM output on this pin.

56.3.5 Enumeration Type Documentation

56.3.5.1 enum pwm_signal_type_t

Enumerator

- kFlexPwmSignedCenterAligned*** Signed center-aligned.
- kFlexPwmCenterAligned*** Unsigned center-aligned.
- kFlexPwmSignedEdgeAligned*** Signed edge-aligned.
- kFlexPwmEdgeAligned*** Unsigned edge-aligned.

56.3.6 Function Documentation

56.3.6.1 `pwm_status_t PWM_DRV_Init (uint32_t instance)`

Enables the module clocks and interrupts in the interrupt controller.

eFlexPWM Peripheral Driver

Parameters

| | |
|-----------------|------------------------------------|
| <i>instance</i> | Instance number of the PWM module. |
|-----------------|------------------------------------|

Returns

kStatusPwmSuccess means success. Otherwise, means failure.

56.3.6.2 void PWM_DRV_Deinit (uint32_t *instance*)

This function de-initializes the EflexPWM module and disables the clock for the submodules. It also disables the module-level interrupts.

Parameters

| | |
|-----------------|------------------------------------|
| <i>instance</i> | Instance number of the PWM module. |
|-----------------|------------------------------------|

56.3.6.3 pwm_status_t PWM_DRV_SetupPwm (uint32_t *instance*, pwm_module_t *subModule*, pwm_module_setup_t * *moduleSetupParams*, pwm_module_signal_setup_t * *signalParams*)

The function initializes the submodule according to the parameters passed in by the user. The function also sets up the value compare registers to match the PWM signal requirements. If the dead time insertion logic is enabled, the pulse period is reduced by the dead time period specified by the user.

Parameters

| | |
|--------------------------|---|
| <i>instance</i> | Instance number of the PWM module. |
| <i>subModule</i> | The FlexPWM submodule that is configured |
| <i>moduleSetupParams</i> | The initialization values used to set up the submodule |
| <i>signalParams</i> | Signal parameters which generate the submodules PWM signals |

Returns

Returns an error if the requested submodule clock is incorrect, i.e., the request for kFlexPwmModule0 for submodule 0 or request for external clock without informing the driver of the external clock frequency by calling PWM_DVR_SetExternalClkFreq(). Success otherwise.

56.3.6.4 void PWM_DRV_UpdatePwmSignal (uint32_t *instance*, pwm_module_t *subModule*, pwm_module_signal_setup_t * *signalParams*)

The function updates the PWM signal to the new value that is passed in. If the dead time insertion logic is enabled then the pulse period is reduced by the dead time period specified by the user.

eFlexPWM Peripheral Driver

Parameters

| | |
|---------------------|---|
| <i>instance</i> | Instance number of the PWM module. |
| <i>subModule</i> | The FlexPWM submodule that is configured |
| <i>signalParams</i> | Signal parameters which generate the submodules PWM signals |

56.3.6.5 void PWM_DRV_SetTriggerCmd (uint32_t *instance*, pwm_module_t *subModule*, pwm_val_regs_t *trigger*, bool *activate*)

This function allows the user to enable or disable the PWM trigger. The PWM has 2 triggers. The trigger 0 is activated when the counter matches VAL 0, VAL 2, or VAL 4 register. The trigger 1 is activated when the counter matches VAL 1, VAL 3, or VAL 5.

Parameters

| | |
|------------------|--|
| <i>instance</i> | Instance number of the PWM module. |
| <i>subModule</i> | The FlexPWM submodule that is configured |
| <i>trigger</i> | Trigger number that the user wants to activate |
| <i>activate</i> | Enable or disable the trigger |

56.3.6.6 void PWM_DRV_SetTriggerVal (uint32_t *instance*, pwm_module_t *subModule*, pwm_val_regs_t *trigger*, uint16_t *triggerVal*)

This function sets the value in the compare register that generates a trigger. Note that the user must make sure that the value of the register being modified is not currently used to generate a PWM signal.

Parameters

| | |
|-------------------|--|
| <i>instance</i> | Instance number of the PWM module. |
| <i>subModule</i> | The FlexPWM submodule that is configured |
| <i>trigger</i> | Trigger number that we wish to configure |
| <i>triggerVal</i> | Trigger value |

56.3.6.7 void PWM_DRV_SetupFault (uint32_t *instance*, pwm_module_t *subModule*, pwm_fault_input_t *faultNum*, pwm_fault_setup_t * *faultParams*, bool *pwmA*, bool *pwmB*, bool *pwmX*)

This function configures a fault parameter and enables the fault for the appropriate sub-module signals.

Parameters

| | |
|--------------------|---|
| <i>instance</i> | Instance number of the PWM module. |
| <i>subModule</i> | The FlexPWM submodule that is configured |
| <i>faultNum</i> | Fault that should be configured |
| <i>faultParams</i> | Parameters that configure the fault |
| <i>pwmA</i> | true: PWM A is disabled by this fault; false: PWM A is not affected by this fault |
| <i>pwmB</i> | true: PWM B is disabled by this fault; false: PWM A is not affected by this fault |
| <i>pwmX</i> | true: PWM X is disabled by this fault; false: PWM A is not affected by this fault |

56.3.6.8 void PWM_DRV_CounterStart (uint32_t instance, uint8_t value)

This function starts the PWM submodule counters.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | Instance number of the PWM module. |
| <i>value</i> | Submodules to start; 4 bit value, 1-bit for each submodule |

56.3.6.9 void PWM_DRV_CounterStop (uint32_t instance, uint8_t value)

This function stops the the PWM submodule counters.

Parameters

| | |
|-----------------|---|
| <i>instance</i> | Instance number of the PWM module. |
| <i>value</i> | Submodules to stop; 4 bit value, 1-bit for each submodule |

56.3.6.10 void PWM_DRV_SetExternalClkFreq (uint32_t instance, uint32_t externalClkFreq)

When using an external signal as clock source, the user should provide the frequency of this clock source so that this driver can calculate the register values used to generate the requested PWM signal.

Parameters

eFlexPWM Peripheral Driver

| | |
|-------------------------|------------------------------------|
| <i>instance</i> | Instance number of the PWM module. |
| <i>externalClk-Freq</i> | External clock frequency (in Hz). |

56.3.7 Variable Documentation

56.3.7.1 `PWM_Type* const g_pwmBase[PWM_INSTANCE_COUNT]`

56.3.7.2 `const IRQn_Type g_pwmCmplrqld[FSL_FEATURE_PWM_CMP_INT_HANDLER_COUNT]`

Chapter 57

Quad Serial Peripheral Interface (QSPI)

57.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Quad Serial Peripheral Interface (QSPI) block of Kinetis devices.

Modules

- [QSPI HAL driver](#)
- [QSPI Peripheral Driver](#)

QSPI HAL driver

57.2 QSPI HAL driver

57.2.1 Overview

This section describes the programming interface of the QSPI HAL driver.

Data Structures

- struct [qspi_flash_timing_t](#)
Flash timing configuration. [More...](#)
- struct [qspi_sflash_size_t](#)
Serial flash size; if there is no such pad, set to 0. [More...](#)
- struct [qspi_dqs_config_t](#)
DQS configure features. [More...](#)
- struct [qspi_flash_config_t](#)
External flash configuration items. [More...](#)

Enumerations

- enum [qspi_read_area_t](#) {
[kQspiReadAHB](#) = 0x0,
[kQspiReadIP](#) = 0x1 }
- enum [qspi_fifo_t](#)
QSPI buffer type.
- enum [qspi_command_seq_t](#)
QSPI command sequence type.
- enum [qspi_endianness_t](#)
QSPI transfer endianness.
- enum [qspi_flag_t](#)
QSPI flags.
- enum [qspi_dma_flag_t](#)
QSPI DMA request flag.
- enum [qspi_state_bit_t](#)
QSPI state bit.
- enum [qspi_dqs_phrase_shift_t](#)
Phrase shift number for DQS mode.

Functions

- void [QSPI_HAL_Init](#) (QuadSPI_Type *base)
Initializes the QSPI module.
- void [QSPI_HAL_SoftwareReset](#) (QuadSPI_Type *base)
Software reset for the QSPI.
- static void [QSPI_HAL_DisableModule](#) (QuadSPI_Type *base)
Disables the QSPI module.
- static void [QSPI_HAL_EnableModule](#) (QuadSPI_Type *base)

- Enables the QSPI module.*

 - static void **QSPI_HAL_SetSCLK** (QuadSPI_Type *base, uint32_t srcfreq, uint32_t sclk)
Sets the QSPI SCLK frequency.
 - static void **QSPI_HAL_SetClockSrc** (QuadSPI_Type *base, uint32_t clockSrc)
Sets the QSPI SCLK frequency.
 - static void **QSPI_HAL_SetDDRMModeCmd** (QuadSPI_Type *base, bool enable)
Enables/disables the QSPI DDR mode.
 - void **QSPI_HAL_ConfigFlash** (QuadSPI_Type *base, **qspi_flash_config_t** *config)
Sets the flash timing settings for the QSPI to meet.
 - void **QSPI_HAL_SetAHBBufferSize** (QuadSPI_Type *base, uint32_t buff_index, uint32_t size)
Sets the QSPI buffer size.
 - void **QSPI_HAL_SetAHBBufferMaster** (QuadSPI_Type *base, uint32_t buff_index, uint32_t master_id)
@ brief Sets the master ID connected.
 - static void **QSPI_HAL_SetBuf0HighPriority** (QuadSPI_Type *base, bool enable)
@ brief Sets the AHB buffer 0 with high priority.
 - static void **QSPI_HAL_SetBuf3AllMaster** (QuadSPI_Type *base, bool enable)
@ brief Sets the AHB buffer 3 to be accessed by all masters.
 - static void **QSPI_HAL_SetEndianness** (QuadSPI_Type *base, **qspi_endianness_t** endian)
@ brief Sets endianness of the QSPI.
 - void **QSPI_HAL_SetParallelModeCmd** (QuadSPI_Type *base, **qspi_command_seq_t** command, bool enable)
@ brief Enables or disables parallel mode.
 - static void **QSPI_HAL_SetIPCommandSeqIndex** (QuadSPI_Type *base, uint32_t seq_index)
@ brief Sets the LUT index for the IP command sequence.
 - static void **QSPI_HAL_SetIPCommandSize** (QuadSPI_Type *base, uint32_t size)
Sets the data transfer size in bytes for the IP command.
 - static void **QSPI_HAL_SetIPCommandAddr** (QuadSPI_Type *base, uint32_t addr)
@ brief Sets address data for the IP command sequence to use.
 - static void **QSPI_HAL_SetBufferCommandSeqIndex** (QuadSPI_Type *base, uint32_t seq_index)
@ brief Sets the LUT index for the buffer command.
 - void **QSPI_HAL_ClearFifo** (QuadSPI_Type *base, **qspi_fifo_t** fifo)
@ brief Clears the buffer FIFO status.
 - static void **QSPI_HAL_ClearSeqId** (QuadSPI_Type *base, **qspi_command_seq_t** seq)
@ brief Clears the command sequence for the IP/buffer command.
 - void **QSPI_HAL_UnlockLUT** (QuadSPI_Type *base)
Unlocks the lookup table.
 - void **QSPI_HAL_LockLUT** (QuadSPI_Type *base)
Locks the lookup table.
 - void **QSPI_HAL_SetLUT** (QuadSPI_Type *base, uint32_t index, uint32_t command)
Sets the serial flash command into the LUT.
 - static void **QSPI_HAL_SetRxWatermark** (QuadSPI_Type *base, uint32_t watermark)
Sets the receive buffer watermark to trigger an interrupt or the DMA request.
 - static void **QSPI_HAL_SetTxWatermark** (QuadSPI_Type *base, uint32_t watermark)
Sets the transmit buffer watermark to trigger an interrupt or the DMA request.
 - void **QSPI_HAL_SetIntCmd** (QuadSPI_Type *base, uint32_t IntFlag, bool enable)
Enables/disables the QSPI interrupt.
 - void **QSPI_HAL_SetDmaCmd** (QuadSPI_Type *base, **qspi_dma_flag_t** DmaFlag, bool enable)
Enables/disables the QSPI DMA.
 - static void **QSPI_HAL_ClearStateFlag** (QuadSPI_Type *base, uint32_t flag)
Clears the QSPI state flags.

QSPI HAL driver

- static uint32_t [QSPI_HAL_GetStateFlag](#) (QuadSPI_Type *base, uint32_t flag)
Gets the QSPI state flags.
- static uint32_t [QSPI_HAL_GetState](#) (QuadSPI_Type *base, uint32_t state)
Gets the QSPI state.
- static uint32_t [QSPI_HAL_GetTransferBytes](#) (QuadSPI_Type *base)
Gets data which have been into transmit FIFO in bytes.
- static uint32_t [QSPI_HAL_GetTxFifoLevel](#) (QuadSPI_Type *base)
Gets data which is still in transmit FIFO in bytes.
- static uint32_t [QSPI_HAL_GetReadBytes](#) (QuadSPI_Type *base)
Gets data which have be removed from receive buffer/FIFO in bytes.
- static uint32_t [QSPI_HAL_GetRxFifoLevel](#) (QuadSPI_Type *base)
Gets data which is still in receive buffer/FIFO in bytes.
- static uint32_t [QSPI_HAL_GetTxFifoAddr](#) (QuadSPI_Type *base)
Gets the transmit FIFO address.
- uint32_t [QSPI_HAL_GetRxFifoAddr](#) (QuadSPI_Type *base)
Gets the receive buffer/FIFO address.
- static void [QSPI_HAL_SetReadDataArea](#) (QuadSPI_Type *base, [qspi_read_area_t](#) area)
Set the area of Rx readout data.
- void [QSPI_HAL_ReadDataBlocking](#) (QuadSPI_Type *base, uint32_t *addr, uint32_t size)
Reads data to an address using a blocking method.
- uint32_t [QSPI_HAL_ReadData](#) (QuadSPI_Type *base, uint32_t index)
Reads data out.
- void [QSPI_HAL_WriteDataBlocking](#) (QuadSPI_Type *base, uint32_t *addr, uint32_t size)
Writes a data series to the QSPI transmit FIFO using a blocking method.
- static void [QSPI_HAL_WriteData](#) (QuadSPI_Type *base, uint32_t data)
Writes data into the transmit FIFO.

57.2.2 Data Structure Documentation

57.2.2.1 struct qspi_flash_timing_t

57.2.2.2 struct qspi_sflash_size_t

57.2.2.3 struct qspi_dqs_config_t

57.2.2.4 struct qspi_flash_config_t

Data Fields

- uint32_t [flashA1Size](#)
Flash A1 size.
- uint32_t [flashA2Size](#)
Flash A2 size.
- uint32_t [flashB1Size](#)
Flash B1 size.
- uint32_t [flashB2Size](#)
Flash B2 size.
- uint32_t [lookuptable](#) [FSL_FEATURE_QSPI_LUT_DEPTH]

- *Flash command in LUT.*
- uint32_t **dataHoldTime**
Data line hold time.
- uint32_t **CSHoldTime**
CS line hold time.
- uint32_t **CSSetupTime**
CS line setup time.
- uint32_t **cloumnspace**
Column space size.
- uint32_t **dataLearnValue**
Data Learn value if enable data learn.
- qspi_endianness_t **endian**
Flash data endianness.
- bool **parallelmode**
If enable parallel mode.
- bool **wordaddress**
If enable word address.
- bool **DQSEnable**
If enable DQS mode.
- qspi_dqs_config_t **dqs_config**
DQS configuration; If not supported, set to NULL.
- bool **DDREnable**
If enable DDR mode.
- bool **octalmode**
If enable octal mode.

57.2.2.4.0.7 Field Documentation

- 57.2.2.4.0.7.1 uint32_t qspi_flash_config_t::dataHoldTime
- 57.2.2.4.0.7.2 qspi_endianness_t qspi_flash_config_t::endian
- 57.2.2.4.0.7.3 bool qspi_flash_config_t::parallelmode
- 57.2.2.4.0.7.4 bool qspi_flash_config_t::wordaddress
- 57.2.2.4.0.7.5 bool qspi_flash_config_t::DQSEnable
- 57.2.2.4.0.7.6 bool qspi_flash_config_t::DDREnable
- 57.2.2.4.0.7.7 bool qspi_flash_config_t::octalmode

57.2.3 Enumeration Type Documentation

57.2.3.1 enum qspi_read_area_t

Enumerator

- kQspiReadAHB** QSPI read from AHB buffer.
- kQspiReadIP** QSPI read from IP FIFO.

QSPI HAL driver

57.2.3.2 enum qspi_dqs_phrase_shift_t

57.2.4 Function Documentation

57.2.4.1 void QSPI_HAL_Init (QuadSPI_Type * *base*)

This function sets all QSPI registers to a known state.

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

57.2.4.2 void QSPI_HAL_SoftwareReset (QuadSPI_Type * *base*)

This function resets both AHB and serial flash domin. This function does not reset the QSPI configuration registers.

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

57.2.4.3 static void QSPI_HAL_DisableModule (QuadSPI_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

57.2.4.4 static void QSPI_HAL_EnableModule (QuadSPI_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

57.2.4.5 static void QSPI_HAL_SetSCLK (QuadSPI_Type * *base*, uint32_t *srcfreq*, uint32_t *sclk*) [inline], [static]

The SCLK frequency controls the data transfer speed of the QSPI. This function sets the clock divide parameter in the QSPI.

Parameters

QSPI HAL driver

| | |
|----------------|-----------------------------|
| <i>base</i> | QSPI base address. |
| <i>srcfreq</i> | QSPI sclk source frequency. |
| <i>sclk</i> | SCLK frequency. |

57.2.4.6 static void QSPI_HAL_SetClockSrc (QuadSPI_Type * *base*, uint32_t *clockSrc*)
[inline], [static]

The SCLK frequency controls the data transfer speed of the QSPI. This function sets the clock divide parameter in the QSPI.

Parameters

| | |
|-----------------|--------------------------|
| <i>base</i> | QSPI base address. |
| <i>clockSrc</i> | QSPI source clock index. |

57.2.4.7 static void QSPI_HAL_SetDDRModeCmd (QuadSPI_Type * *base*, bool *enable*)
[inline], [static]

Parameters

| | |
|---------------|-----------------------------|
| <i>base</i> | QSPI base address. |
| <i>enable</i> | Enable or disable DDR mode. |

57.2.4.8 void QSPI_HAL_ConfigFlash (QuadSPI_Type * *base*, qspi_flash_config_t * *config*)

Parameters

| | |
|---------------------|-----------------------------|
| <i>base</i> | QSPI base address. |
| <i>TimingConfig</i> | Flash timing configuration. |

57.2.4.9 void QSPI_HAL_SetAHBBufferSize (QuadSPI_Type * *base*, uint32_t *buff_index*, uint32_t *size*)

There are 4 QSPI AHB buffers. The size of each buffer can be set, but users should ensure that the size of one buffer is no more than the overall size. There is no hardware check for this.

Parameters

| | |
|---------------------|----------------------|
| <i>base</i> | QSPI base address. |
| <i>buffer_index</i> | Buffer index number. |
| <i>size</i> | Buffer size bytes. |

57.2.4.10 void QSPI_HAL_SetAHBBufferMaster (QuadSPI_Type * *base*, uint32_t *buff_index*, uint32_t *master_id*)

There are 4 AHB buffers for QSPI. An AHB buffer can be accessed by one master except for the buffer3.

Parameters

| | |
|-------------------|---|
| <i>base</i> | QSPI base address. |
| <i>buff_index</i> | AHB buffer index, it can be 0 ~3. |
| <i>master_id</i> | AHB master id, it can be ARM core, DMA and so on. |

57.2.4.11 static void QSPI_HAL_SetBuf0HighPriority (QuadSPI_Type * *base*, bool *enable*) [inline], [static]

There are 4 AHB buffers for QSPI. The buffer 0 can be used as the highest priority buffer, which means that it delays access to other AHB buffers until accessing buffer0 is complete.

Parameters

| | |
|---------------|---|
| <i>base</i> | QSPI base address. |
| <i>enable</i> | True means enable high priority, false means disable. |

57.2.4.12 static void QSPI_HAL_SetBuf3AllMaster (QuadSPI_Type * *base*, bool *enable*) [inline], [static]

There are 4 AHB buffers for QSPI. Each buffer can be accessed by a master. If this feature is enabled, all masters which have not been connected to AHB buffers can access the buffer3.

Parameters

QSPI HAL driver

| | |
|---------------|--|
| <i>base</i> | QSPI base address. |
| <i>enable</i> | True means enable all master feature, false means disable. |

57.2.4.13 `static void QSPI_HAL_SetEndianness (QuadSPI_Type * base,
qspi_endianness_t endian) [inline], [static]`

Parameters

| | |
|---------------|---------------------------|
| <i>base</i> | QSPI base address. |
| <i>endian</i> | Endianness type for QSPI. |

57.2.4.14 `void QSPI_HAL_SetParallelModeCmd (QuadSPI_Type * base,
qspi_command_seq_t command, bool enable)`

Parameters

| | |
|----------------|---|
| <i>base</i> | QSPI base address. |
| <i>command</i> | Which kind of command need to be parallel mode. |
| <i>enable</i> | True means enable, false means disable. |

57.2.4.15 `static void QSPI_HAL_SetIPCommandSeqIndex (QuadSPI_Type * base,
uint32_t seq_index) [inline], [static]`

This function triggers an IP command.

An IP command connects to a LUT index. While users set the LUT index, it triggers an IP command. An application should ensure that a correct sequence is written in the LUT index.

Parameters

| | |
|------------------|------------------------------------|
| <i>base</i> | QSPI base address. |
| <i>seq_index</i> | Sequence index for the IP command. |

57.2.4.16 `static void QSPI_HAL_SetIPCommandSize (QuadSPI_Type * base, uint32_t
size) [inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | QSPI base address |
| <i>size</i> | Data transfer size in bytes. |

57.2.4.17 static void QSPI_HAL_SetIPCommandAddr (QuadSPI_Type * *base*, uint32_t *addr*) [inline], [static]

An IP command connects to an LUT index. While users set the LUT index, it triggers an IP command. An application should ensure that a correct sequence is written in the LUT index.

Parameters

| | |
|------------------|------------------------------------|
| <i>base</i> | QSPI base address. |
| <i>seq_index</i> | Sequence index for the IP command. |

57.2.4.18 static void QSPI_HAL_SetBufferCommandSeqIndex (QuadSPI_Type * *base*, uint32_t *seq_index*) [inline], [static]

This function triggers a buffer command.

A buffer command connects to an LUT index. While users set the LUT index, it triggers a buffer command. An application should ensure that a correct sequence is written in the LUT index.

Parameters

| | |
|------------------|--|
| <i>base</i> | QSPI base address. |
| <i>seq_index</i> | Sequence index for the buffer command. |

57.2.4.19 void QSPI_HAL_ClearFifo (QuadSPI_Type * *base*, qspi_fifo_t *fifo*)

This function resets the transmit/receive the FIFO pointer and the FIFO counter.

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

QSPI HAL driver

| | |
|---------------|---|
| <i>buffer</i> | Which FIFO needs to be reset, TX, RX or both. |
|---------------|---|

**57.2.4.20 static void QSPI_HAL_ClearSeqId (QuadSPI_Type * *base*,
qspi_command_seq_t *seq*) [inline], [static]**

This function can reset the command sequence.

Parameters

| | |
|-------------|---|
| <i>base</i> | QSPI base address. |
| <i>seq</i> | Which command sequence need to reset, IP command, buffer command or both. |

57.2.4.21 void QSPI_HAL_UnlockLUT (QuadSPI_Type * *base*)

The lookup table is a table for sequences of flash instructions. This function unlocks the lookup table so that software can write new instructions.

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

57.2.4.22 void QSPI_HAL_LockLUT (QuadSPI_Type * *base*)

Lookup table is a table for sequences of flash instructions. This function locks the lookup table. Users cannot write to the lookup table after it is locked.

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

**57.2.4.23 void QSPI_HAL_SetLUT (QuadSPI_Type * *base*, uint32_t *index*, uint32_t
command)**

There are two instructions in each LUT register and 4 LUT registers make an LUT sequence, which means a serial flash command.

Parameters

| | |
|----------------|-----------------------|
| <i>base</i> | QSPI base address. |
| <i>index</i> | LUT sequence index. |
| <i>command</i> | Serial flash command. |

57.2.4.24 `static void QSPI_HAL_SetRxWatermark (QuadSPI_Type * base, uint32_t watermark) [inline], [static]`

Parameters

| | |
|------------------|---|
| <i>base</i> | QSPI base address. |
| <i>watermark</i> | Number of 4 bytes. 1 means 4 bytes, 2 means 8 bytes, and so on. |

57.2.4.25 `static void QSPI_HAL_SetTxWatermark (QuadSPI_Type * base, uint32_t watermark) [inline], [static]`

Parameters

| | |
|------------------|---|
| <i>base</i> | QSPI base address. |
| <i>watermark</i> | Number of 4 bytes. 1 means 4 bytes, 2 means 8 bytes, and so on. |

57.2.4.26 `void QSPI_HAL_SetIntCmd (QuadSPI_Type * base, uint32_t IntFlag, bool enable)`

Parameters

| | |
|----------------|---|
| <i>base</i> | QSPI base address. |
| <i>IntFlag</i> | Indicate which interrupt need to set. It can be a combination of <code>qspi_flag_t</code> . |
| <i>enable</i> | True means enable interrupt, false means disable. |

57.2.4.27 `void QSPI_HAL_SetDmaCmd (QuadSPI_Type * base, qspi_dma_flag_t DmaFlag, bool enable)`

QSPI HAL driver

Parameters

| | |
|----------------|---|
| <i>base</i> | QSPI base address. |
| <i>DmaFlag</i> | The DMA flag can only be the choice of the <code>qspi_dma_flag_t</code> . |
| <i>enable</i> | True means enable DMA request, false means disable. |

57.2.4.28 `static void QSPI_HAL_ClearStateFlag (QuadSPI_Type * base, uint32_t flag)`
[inline], [static]

Parameters

| | |
|-------------|--|
| <i>base</i> | QSPI base address. |
| <i>flag</i> | QSPI flag type, it can be one of or combinations of <code>qspi_flag_t</code> . |

57.2.4.29 `static uint32_t QSPI_HAL_GetStateFlag (QuadSPI_Type * base, uint32_t flag)`
[inline], [static]

Parameters

| | |
|-------------|--|
| <i>base</i> | QSPI base address. |
| <i>flag</i> | QSPI flag type, it can be one of or combinations of <code>qspi_flag_t</code> . |

57.2.4.30 `static uint32_t QSPI_HAL_GetState (QuadSPI_Type * base, uint32_t state)`
[inline], [static]

Parameters

| | |
|--------------|--|
| <i>base</i> | QSPI base address. |
| <i>state</i> | QSPI state type, it can be one of or combinations of <code>qspi_state_bit_t</code> . |

Returns

State value.

57.2.4.31 `static uint32_t QSPI_HAL_GetTransferBytes (QuadSPI_Type * base)`
[inline], [static]

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

Returns

Data Size in bytes, how many data have transferred into transmit FIFO.

57.2.4.32 `static uint32_t QSPI_HAL_GetTxFifoLevel (QuadSPI_Type * base)`
`[inline], [static]`

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

Returns

Data Size in bytes, how many data now still in transmit FIFO.

57.2.4.33 `static uint32_t QSPI_HAL_GetReadBytes (QuadSPI_Type * base)` `[inline],`
`[static]`

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

Returns

Data Size in bytes, how many data have removed form receive buffer/FIFO.

57.2.4.34 `static uint32_t QSPI_HAL_GetRxFifoLevel (QuadSPI_Type * base)`
`[inline], [static]`

Parameters

QSPI HAL driver

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

Returns

Data Size in bytes, how many data now still in receive buffer/FIFO.

57.2.4.35 `static uint32_t QSPI_HAL_GetTxFifoAddr (QuadSPI_Type * base) [inline], [static]`

This function gets the DMA transfer.

Parameters

| | |
|-------------|--------------------|
| <i>base</i> | QSPI base address. |
|-------------|--------------------|

57.2.4.36 `uint32_t QSPI_HAL_GetRxFifoAddr (QuadSPI_Type * base)`

This function is used in the DMA transfer.

Parameters

| | |
|-------------|-----------------------------------|
| <i>base</i> | QSPI base address. Rx FIFO index. |
|-------------|-----------------------------------|

57.2.4.37 `static void QSPI_HAL_SetReadDataArea (QuadSPI_Type * base, qspi_read_area_t area) [inline], [static]`

Parameters

| | |
|-------------|---|
| <i>base</i> | QSPI base address. |
| <i>area</i> | From IP bus register or AHB bus buffer. |

57.2.4.38 `void QSPI_HAL_ReadDataBlocking (QuadSPI_Type * base, uint32_t * addr, uint32_t size)`

This function is a blocking function. It waits until the buffer has data and then moves it out.

Parameters

| | |
|-------------|---|
| <i>base</i> | QSPI base address. |
| <i>addr</i> | Address which put data into. |
| <i>size</i> | Data Size in bytes, how many data need to read out. It should be integrated divided by 4. |

57.2.4.39 uint32_t QSPI_HAL_ReadData (QuadSPI_Type * *base*, uint32_t *index*)

This function is a non-blocking function. Software should ensure that there is valid data in the index.

Parameters

| | |
|--------------|--|
| <i>base</i> | QSPI base address. |
| <i>index</i> | Rx buffer/FIFO index which data located. |

Returns

Data in that index.

57.2.4.40 void QSPI_HAL_WriteDataBlocking (QuadSPI_Type * *base*, uint32_t * *addr*, uint32_t *size*)

This function is a blocking function. It waits until there is space in the transmit FIFO to write data in.

Parameters

| | |
|-------------|--|
| <i>base</i> | QSPI base address. |
| <i>addr</i> | Source data address. |
| <i>size</i> | Data Size in bytes, how many data need to write. It should be integrated divided by 4. |

**57.2.4.41 static void QSPI_HAL_WriteData (QuadSPI_Type * *base*, uint32_t *data*)
[inline], [static]**

This function is a non-blocking function. Software should ensure that there is space in the transmit FIFO.

QSPI HAL driver

Parameters

| | |
|-------------|---------------------------------|
| <i>base</i> | QSPI base address. |
| <i>data</i> | Which data need to be write in. |

57.3 QSPI Peripheral Driver

57.3.1 Overview

This chapter describes the programming interface of the QSPI peripheral driver.

The following is a basic step-by-step overview of how to initialize QSPI and use QSPI for transfers. For API specific examples, see the examples below. The following example uses the interrupt-driven APIs and a blocking transfer to illustrate a high-level step-by-step usage.

```
//Init QSPI module. User should transfer a state memory for QSPI internal use
QSPI_DRV_Init(instance, &state);
//Get QSPI default settings and configure the QSPI
qspi_config_t config;
//Get default QSPI configure parameters.
QSPI_DRV_GetDefaultQspiConfig(&config);
//Configure QSPI buffer size according to flash page size connected with QSPI
config.AHBbufferSize[3] = FLASH_PAGE_SIZE;
//Write QSPI configure param into QSPI registers.
QSPI_DRV_ConfigQspi(instance, &config);
//According to serial flash feature to configure flash settings
qspi_flash_config_t flash_config;
...
QSPI_DRV_ConfigFlash(instance, &flash_config);
//Execute serial flash command in cmdIdx of LUT.
QSPI_DRV_ExecuteFlashCommand(instance, cmdIdx);
//If it is program command, provide data using blocking way.
QSPI_DRV_WriteDataBlocking(instance, src_addr, size);
...
...
//Deinitialize QSPI module.
QSPI_DRV_Deinit(instance);
```

57.3.2 QSPI Run-time state structures

The QSPI driver uses a run-time state structure to track the ongoing data transfers. The state structure for the driver is called `qspi_state_t`. This structure holds data that the QSPI peripheral driver uses to communicate between the transfer function and the interrupt handler and other driver functions. The interrupt handler in the driver also uses this information to keep track of its progress. The user is only required to pass the memory for the run-time state structure. The QSPI driver populates the members.

57.3.3 QSPI Configure structures

The QSPI driver uses instances of the `qspi_config_t` structure to represent the QSPI bus and buffer configuration required to communicate to an external flash that is connected to QSPI.

The configuration structure consists of the following settings: SCLK (baud rate in Hz), clock source, watermark settings, and AHB buffer settings for read data via AHB bus.

QSPI Peripheral Driver

57.3.4 QSPI Flash Configure structures

The QSPI driver uses instances of the `qspi_flash_config_t` structure to represent the flash features connected to the QSPI module.

The configuration structure consists of the following settings: flash size (supports maximum 2 flash), lookup table for flash commands, flash timing settings, flash endianness, and specific flash feature settings.

57.3.5 QSPI Initialization

To initialize the QSPI driver, call the `QSPI_DRV_Init()` function and pass the instance number of the QSPI peripheral. For example, to use the QSPI0 module, pass a value 0 to the initialization function. In addition, the user also passes in the pointer to the run-time state structure used by the driver to keep track of data transfers.

57.3.6 QSPI Transfers

The driver supports three different methods to transfer data: polling, interrupt, and DMA. The polling transfer is a blocking function and others are both non-blocking.

When using DMA to transfer data, ensure that the data is consistent when there is cache for memory. This means, when reading/ writing the data from/to memory, the application should ensure that data from or to the memory device is not cached.

Example for non-blocking function APIs and associated functions (interrupt and DMA-driven):

```
//Write data via eDMA, it is non-blocking
QSPI_DRV_WriteDataEdma(instance, src_addr, size);
....
//Wait until all data is written into TXFIFO
while(QSPI_DRV_GetTxStatus(instance) == kStatus_QSPI_DeviceBusy)
{}
```

57.3.7 QSPI De-initialization

To deinitialize and shut down the QSPI module, call the function `QSPI_DRV_Deinit()`.

Files

- file `fsl_qspi_driver.h`

Data Structures

- struct `qspi_state_t`

- *QSPI runtime state structure. [More...](#)*
- struct [qspi_lut_command_t](#)
QSPI flash command structure. [More...](#)
- struct [qspi_config_t](#)
QSPI configuration structure. [More...](#)

Enumerations

- enum [qspi_status_t](#)
Status structure of QSPI.
- enum [qspi_flash_command_t](#)
Serial Flash command ID for the QSPI engine.
- enum [qspi_pad_type_t](#)
QSPI command pad type.
- enum [qspi_command_mode_t](#)
QSPI command Mode type.

Functions

- [qspi_status_t QSPI_DRV_Init](#) (uint32_t instance, [qspi_state_t](#) *state)
Initializes the QSPI module and internal state.
- [qspi_status_t QSPI_DRV_Deinit](#) (uint32_t instance)
Deinitializes the QSPI module.
- [qspi_status_t QSPI_DRV_ConfigQspi](#) (uint32_t instance, [qspi_config_t](#) *config)
Configures the QSPI features.
- static void [QSPI_DRV_ConfigClockSrc](#) (uint32_t instance, uint32_t clkSrc)
Configures the QSPI clock source.
- void [QSPI_DRV_GetDefaultQspiConfig](#) ([qspi_config_t](#) *config)
Gets default settings for QSPI.
- static void [QSPI_DRV_ConfigFlash](#) (uint32_t instance, [qspi_flash_config_t](#) *flashConfig)
Configures the serial flash parameter.
- static void [QSPI_DRV_SetIPCommandAddr](#) (uint32_t instance, uint32_t addr)
Sets the IP command address.
- static void [QSPI_DRV_SetIPCommandSize](#) (uint32_t instance, uint32_t size)
Sets the IP command size.
- static void [QSPI_DRV_WriteDataBlocking](#) (uint32_t instance, uint32_t *addr, uint32_t size)
Writes data to the QSPI transmit buffer.
- [qspi_status_t QSPI_DRV_WriteDataInt](#) (uint32_t instance, uint32_t *addr, uint32_t size)
Writes data to the QSPI transmit buffer using interrupts.
- [qspi_status_t QSPI_DRV_WriteDataEdma](#) (uint32_t instance, uint32_t *addr, uint32_t size)
Writes data to the QSPI transmit buffer using the DMA method.
- static void [QSPI_DRV_ReadDataBlocking](#) (uint32_t instance, uint32_t *addr, uint32_t size)
Reads data from the QSPI receive buffer.
- void [QSPI_DRV_ReadDataInt](#) (uint32_t instance, uint32_t *addr, uint32_t size)
Reads data from the QSPI receive buffer using interrupts.
- void [QSPI_DRV_ReadDataEdma](#) (uint32_t instance, uint32_t *addr, uint32_t size)
Reads data from the QSPI receive buffer using the DMA method.
- static uint32_t [QSPI_DRV_GetQspiStatus](#) (uint32_t instance, uint32_t status)
Gets the state value of QSPI.

QSPI Peripheral Driver

- static void [QSPI_DRV_ClearFlag](#) (uint32_t instance, uint32_t flag)
Clears the QSPI state flags.
- static void [QSPI_DRV_ClearFifo](#) (uint32_t instance, [qspi_fifo_t](#) fifo)
Clears the QSPI FIFO logic.
- static void [QSPI_DRV_SoftwareReset](#) (uint32_t instance)
Software reset for the QSPI logic.
- [qspi_status_t](#) [QSPI_DRV_GetTxStatus](#) (uint32_t instance)
Gets the status of the transmit transfer.
- [qspi_status_t](#) [QSPI_DRV_GetRxStatus](#) (uint32_t instance)
Gets the status of the receive transfer.
- void [QSPI_DRV_UpdateLUT](#) (uint32_t instance, uint32_t index, uint32_t *cmd)
Updates the LUT table.
- void [QSPI_DRV_ExecuteFlashCommand](#) (uint32_t instance, uint32_t index)
Executes the IP serial flash command.
- void [QSPI_DRV_ExecuteBufferCommand](#) (uint32_t instance, uint32_t index)
Executes the buffer serial flash command.
- void [QSPI_DRV_TxIrqHandler](#) (uint32_t instance)
Transfers the interrupt handler.
- void [QSPI_DRV_RxIrqHandler](#) (uint32_t instance)
Receives the interrupt handler.

57.3.8 Data Structure Documentation

57.3.8.1 struct [qspi_state_t](#)

57.3.8.2 struct [qspi_lut_command_t](#)

Data Fields

- uint32_t [addr](#)
Address used in the serial flash command.
- uint8_t [cmd](#)
Serial flash command number.
- uint8_t [param](#)
Parameter used in the serial flash command.
- uint8_t [LUTIndex](#)
Location of the command in the look up table.
- uint8_t [dummy_cycle](#)
Dummy cycle number of the instruction.
- uint8_t [dummy_index](#)
Dummy instruction index.
- [qspi_pad_type_t](#) [padType](#)
1 pad, 4 pad or 8 pad
- [qspi_flash_command_t](#) [commandType](#)
command type

57.3.8.2.0.8 Field Documentation

57.3.8.2.0.8.1 `uint32_t qspi_lut_command_t::addr`

57.3.8.2.0.8.2 `uint8_t qspi_lut_command_t::cmd`

57.3.8.2.0.8.3 `uint8_t qspi_lut_command_t::param`

57.3.8.2.0.8.4 `uint8_t qspi_lut_command_t::LUTIndex`

57.3.8.2.0.8.5 `uint8_t qspi_lut_command_t::dummy_cycle`

57.3.8.2.0.8.6 `uint8_t qspi_lut_command_t::dummy_index`

57.3.8.3 struct `qspi_config_t`

Data Fields

- `clock_qspi_src_t clockSrc`
Clock source of QSPI module.
- `uint32_t sclk`
Serial flash clock frequency, which should be smaller than the QSPI source clock.
- `uint8_t txWatermark`
QSPI transmit watermark value.
- `uint8_t rxWatermark`
QSPI receive watermark value.
- `uint32_t AHBbufferSize` [FSL_FEATURE_QSPI_AHB_BUFFER_COUNT]
AHB buffer size.
- `uint8_t AHBbufferMaster` [FSL_FEATURE_QSPI_AHB_BUFFER_COUNT]
AHB buffer master.
- `bool AHBbuffer3AllMaster`
Is AHB buffer3 for all master.
- `dma_request_source_t txSource`
DMA request source for QSPI transmit.
- `dma_request_source_t rxSource`
DMA request source for QSPI receive.

57.3.10 Function Documentation

57.3.10.1 `qspi_status_t QSPI_DRV_Init (uint32_t instance, qspi_state_t * state)`

This function initializes the internal state in QSPI PD and calls the HAL API to initialize the QSPI module.

Parameters

| | |
|-----------------|---|
| <i>instance</i> | QSPI module instance. |
| <i>state</i> | State structure used by QSPI PD. Users MUST allocate the space for QSPI and the memory should NOT be freed until the QSPI is deinitialized. |

57.3.10.2 `qspi_status_t QSPI_DRV_Deinit (uint32_t instance)`

Clears the QSPI state and QSPI module registers.

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
|-----------------|-----------------------|

57.3.10.3 `qspi_status_t QSPI_DRV_ConfigQspi (uint32_t instance, qspi_config_t * config)`

The configuration of QSPI includes configuration of the QSPI module and the configuration of the serial flash connected to the QSPI. This function configures the parameters for QSPI only, not the serial flash.

Parameters

| | |
|-----------------|-----------------------------------|
| <i>instance</i> | QSPI module instance. |
| <i>config</i> | Config structure for QSPI module. |

57.3.10.4 `static void QSPI_DRV_ConfigClockSrc (uint32_t instance, uint32_t clkSrc) [inline], [static]`

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
| <i>clkSrc</i> | QSPI clock source. |

57.3.10.5 `void QSPI_DRV_GetDefaultQspiConfig (qspi_config_t * config)`

QSPI works with default settings. This function provides the default parameters for the QSPI configuration.

QSPI Peripheral Driver

Parameters

| | |
|---------------|-------------------------------|
| <i>config</i> | QSPI configuration structure. |
|---------------|-------------------------------|

57.3.10.6 static void QSPI_DRV_ConfigFlash (uint32_t *instance*, qspi_flash_config_t * *flashConfig*) [inline], [static]

This function configures the serial flash relevant parameters, such as the size, command, and so on.

Parameters

| | |
|--------------------|---------------------------------|
| <i>instance</i> | QSPI module instance. |
| <i>flashConfig</i> | Flash configuration parameters. |

57.3.10.7 static void QSPI_DRV_SetIPCommandAddr (uint32_t *instance*, uint32_t *addr*) [inline], [static]

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
| <i>addr</i> | IP command address. |

57.3.10.8 static void QSPI_DRV_SetIPCommandSize (uint32_t *instance*, uint32_t *size*) [inline], [static]

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
| <i>size</i> | IP command size. |

57.3.10.9 static void QSPI_DRV_WriteDataBlocking (uint32_t *instance*, uint32_t * *addr*, uint32_t *size*) [inline], [static]

This function writes a continuous data to the QSPI transmit FIFO. This function is a block function and can return only when finished. This function uses polling methods.

Parameters

| | |
|-----------------|---|
| <i>instance</i> | QSPI module instance. |
| <i>addr</i> | Start address of source data. |
| <i>size</i> | Data length in bytes to be transferred. |

57.3.10.10 `qspi_status_t QSPI_DRV_WriteDataInt (uint32_t instance, uint32_t * addr, uint32_t size)`

This function writes data to the QSPI transmit FIFO. This function is non-blocking.

Parameters

| | |
|-----------------|---|
| <i>instance</i> | QSPI module instance. |
| <i>addr</i> | Start address of source data. |
| <i>size</i> | Data length in bytes to be transferred. |

57.3.10.11 `qspi_status_t QSPI_DRV_WriteDataEdma (uint32_t instance, uint32_t * addr, uint32_t size)`

This function writes data to the QSPI transmit FIFO. This function is non-blocking.

Parameters

| | |
|-----------------|---|
| <i>instance</i> | QSPI module instance. |
| <i>addr</i> | Start address of source data. |
| <i>size</i> | Data length in bytes to be transferred. |

57.3.10.12 `static void QSPI_DRV_ReadDataBlocking (uint32_t instance, uint32_t * addr, uint32_t size) [inline], [static]`

This function reads continuous data from the QSPI receive buffer/FIFO. This function is a blocking function and can return only when finished. This function uses polling methods.

Parameters

QSPI Peripheral Driver

| | |
|-----------------|----------------------------------|
| <i>instance</i> | QSPI module instance. |
| <i>addr</i> | Destination address to put data. |
| <i>size</i> | Data length in bytes to be read. |

57.3.10.13 void QSPI_DRV_ReadDataInt (uint32_t *instance*, uint32_t * *addr*, uint32_t *size*)

To find out the transfer state, call QSPI_DRV_GetRxState function. If the return value is kStatus_QSPI_Success, the read is finished.

Parameters

| | |
|-----------------|----------------------------------|
| <i>instance</i> | QSPI module instance. |
| <i>addr</i> | Destination address to put data. |
| <i>size</i> | Data length in bytes to be read. |

57.3.10.14 void QSPI_DRV_ReadDataEdma (uint32_t *instance*, uint32_t * *addr*, uint32_t *size*)

To find out the transfer state, call QSPI_DRV_GetRxState function. If the return value is kStatus_QSPI_Success, the read is finished.

Parameters

| | |
|-----------------|----------------------------------|
| <i>instance</i> | QSPI module instance. |
| <i>addr</i> | Destination address to put data. |
| <i>size</i> | Data length in bytes to be read. |

57.3.10.15 static uint32_t QSPI_DRV_GetQspiStatus (uint32_t *instance*, uint32_t *status*) [inline], [static]

This function returns the status flag in the QSPI_SR register according to the input status bit and gets single or multiple status value.

Parameters

| | |
|-----------------|---|
| <i>instance</i> | QSPI module instance. |
| <i>status</i> | Element of <code>qspi_state_bit_t</code> , it can be one or multiple. |

Returns

State bit value.

57.3.10.16 `static void QSPI_DRV_ClearFlag (uint32_t instance, uint32_t flag)`
[inline], [static]

Parameters

| | |
|-----------------|---|
| <i>instance</i> | QSPI module instance. |
| <i>flag</i> | Which kind of QSPI flags to be cleared. |

57.3.10.17 `static void QSPI_DRV_ClearFifo (uint32_t instance, qspi_fifo_t fifo)`
[inline], [static]

Parameters

| | |
|-----------------|--|
| <i>instance</i> | QSPI module instance. |
| <i>flag</i> | Which kind of QSPI FIFO to be cleared. |

57.3.10.18 `static void QSPI_DRV_SoftwareReset (uint32_t instance)` **[inline],**
[static]

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
|-----------------|-----------------------|

57.3.10.19 `qspi_status_t QSPI_DRV_GetTxStatus (uint32_t instance)`

Parameters

QSPI Peripheral Driver

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
|-----------------|-----------------------|

Returns

If `kStatus_QSPI_Success` is returned, the transfer is finished.

57.3.10.20 `qspi_status_t QSPI_DRV_GetRxStatus (uint32_t instance)`

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
|-----------------|-----------------------|

Returns

If `kStatus_QSPI_Success` is returned, transfer is finished.

57.3.10.21 `void QSPI_DRV_UpdateLUT (uint32_t instance, uint32_t index, uint32_t * cmd)`

Parameters

| | |
|-----------------|--|
| <i>instance</i> | QSPI module instance. |
| <i>index</i> | Which LUT index needs to be located. It should be an integer divided by 4. |
| <i>cmd</i> | Command sequence array. |

57.3.10.22 `void QSPI_DRV_ExecuteFlashCommand (uint32_t instance, uint32_t index)`

Parameters

| | |
|-----------------|--|
| <i>instance</i> | QSPI module instance. |
| <i>index</i> | Which LUT index needs to be located. It should be an integer divided by 4. |

57.3.10.23 `void QSPI_DRV_ExecuteBufferCommand (uint32_t instance, uint32_t index)`

Parameters

| | |
|-----------------|--|
| <i>instance</i> | QSPI module instance. |
| <i>index</i> | Which LUT index needs to be located. It should be an integer divided by 4. |

57.3.10.24 void QSPI_DRV_TxIrqHandler (uint32_t instance)

This handler transfers data and also clears an error flag.

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
|-----------------|-----------------------|

57.3.10.25 void QSPI_DRV_RxIrqHandler (uint32_t instance)

This handler receives data and also clears an error flag.

Parameters

| | |
|-----------------|-----------------------|
| <i>instance</i> | QSPI module instance. |
|-----------------|-----------------------|

Chapter 58

Quad Timer

58.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Quad Timer block of Kinetis devices.

Modules

- [Quad Timer HAL driver](#)
- [Quad Timer Peripheral Driver](#)

Quad Timer HAL driver

58.2 Quad Timer HAL driver

This chapter describes the programming interface of the Quad Timer HAL driver.

This section describes the programming interface of the Quad timer HAL driver. The Quad Timer HAL driver initializes the Quad timer registers and provides functions to set up the Quad Timer module to generate PWM signals and input capture.

58.2.1 Quad Timer HAL Initialization

The HAL driver provides the initialization (`QUADTMR_HAL_Init()`) function to initialize the Quad Timer module. It also provides a function (`QUADTMR_HAL_SetupCounter()`) to initialize the counters. This user needs to pass this structure to initialize the counter. These functions do not start the counter. The user must call `QUADTMR_HAL_SetCountMode()` to set the count mode and start the counter.

```
typedef struct QuadTmrCounterParams
{
    uint16_t counterVal;
```

58.2.2 Quad Timer output signals

The HAL provides a function to force out a High or a Low signal (`QUADTMR_HAL_ForceOutVal()`) on the Quad Timer output pin. The HAL also has a function to output pulses (`QUADTMR_HAL_OutPulses()`). The user needs to specify the number of pulses to output and the source clock to use. Finally, HAL provides a function (`QUADTMR_HAL_OutPwmSignal()`) to generate a PWM signal. The user needs to calculate the high and low pulse count to be programmed to the Quad Timer compare registers.

58.2.3 Quad Timer for input capture

The HAL driver provides `QUADTMR_HAL_SetupInputCapture()` which allows the user to count the source clock cycles until a capture event arrives. The count is stored in the capture register and the counter is started by this function.

58.3 Quad Timer Peripheral Driver

This section describes the programming interface of the Quad Timer Peripheral driver.

58.3.1 Quad Timer Overview

The Quad Timer module supports a 64-bit counter and generation of PWM signals.

58.3.2 Quad Timer Initialization

1. To initialize the Quad Timer driver, call the `QUADTMR_DRV_Init()` function and pass the instance number of the relevant Quad Timer. For example, to use Quad timer 0, pass a value of 0 to the initialization function.

58.3.3 Quad Timer Generate a PWM signal

Quad timer calls the `QUADTMR_DRV_SetupFlexPwm()` function to generate a PWM signal. The user provides the input clock source which is derived from the IP Bus clock. The user also provides the desired PWM signal's period in microseconds and the pulse width in microseconds. This function enables the pre-load function for each compare register to allow updating the PWM signal characteristics at a later time. To update the PWM period and/or pulse width, call the `QUADTMR_DRV_UpdatePwm()` function. The PWM continues to be derived from the clock source provided during setup.

58.3.4 Quad Timer as a 64-bit counter

Quad timer calls the `QUADTMR_DRV_Start64BitCounter()` function to start a 64-bit counter. The user chooses which source clock is used to run the counter. User must ensure that `QUADTMR_DRV_Init()` is called on all timer instances as all will be used in this mode. Timer 0 is clocked via the source clock and Timers 1, 2 and, 3 are set up in cascade mode. All 4 counters count up to 0xFFFF, then roll-over and continue counting. All 4 timers are used in this mode and cannot be used for any other operation. Call the `QUADTMR_DRV_Get64BitCountVal()` to read the count value.

Quad Timer Peripheral Driver

Chapter 59

Reset Control Module (RCM)

59.1 Overview

The Kinetis SDK provides a HAL driver for the Reset Control Module (RCM) block of Kinetis devices.

Modules

- [RCM HAL driver](#)

RCM HAL driver

59.2 RCM HAL driver

59.2.1 Overview

The RCM implements the reset functions for the MCU.

RCM HAL driver provides these APIs:

- APIs for system reset source.
- APIs for RESET pin filter.
- APIs for ROM boot.

59.2.2 System Reset Source APIs

The function [RCM_HAL_GetSrcStatus\(\)](#) checks whether the system is reset by a specific source. For some platforms, there is sticky register for reset source. The function [RCM_HAL_GetStickySrcStatus\(\)](#) checks the sticky status and the function [RCM_HAL_ClearStickySrcStatus\(\)](#) clears the sticky status.

59.2.3 RESET Pin Filter APIs

The function [RCM_HAL_SetResetPinFilterConfig\(\)](#) configures the RESET pin filter, including enable/disable filter, filter selection, and filter width setting.

59.2.4 ROM Boot APIs

The MCU can be configured to boot from ROM forcefully. Use function [RCM_HAL_SetForceBootRomSrc\(\)](#) to set the boot source and use function [RCM_HAL_GetBootRomSrc\(\)](#) to get the boot source after reset.

Files

- file [fsl_rcm_hal.h](#)

Data Structures

- struct [rcm_reset_pin_filter_config_t](#)
Reset pin filter configuration. [More...](#)

Enumerations

- enum `rcm_source_names_t` {
`kRcmSrcAll` = 0U,
`kRcmWakeup` = RCM_SRS0_WAKEUP_MASK,
`kRcmLowVoltDetect` = RCM_SRS0_LVD_MASK,
`kRcmWatchDog` = RCM_SRS0_WDOG_MASK,
`kRcmExternalPin` = RCM_SRS0_PIN_MASK,
`kRcmPowerOn` = RCM_SRS0_POR_MASK,
`kRcmCoreLockup` = RCM_SRS1_LOCKUP_MASK << 8U,
`kRcmSoftware` = RCM_SRS1_SW_MASK << 8U,
`kRcmMdmAp` = RCM_SRS1_MDM_AP_MASK << 8U,
`kRcmStopModeAckErr` = RCM_SRS1_SACKERR_MASK << 8U }
System Reset Source Name definitions.
- enum `rcm_filter_run_wait_modes_t` {
`kRcmFilterDisabled`,
`kRcmFilterBusClk`,
`kRcmFilterLpoClk`,
`kRcmFilterReserverd` }
Reset pin filter select in Run and Wait modes.

Reset Control Module APIs

- `uint32_t RCM_HAL_GetSrcStatus` (RCM_Type *base, uint32_t statusMask)
Gets the reset source status.
- void `RCM_HAL_SetResetPinFilterConfig` (RCM_Type *base, `rcm_reset_pin_filter_config_t` *config)
Sets the reset pin filter base on configuration.

59.2.5 Data Structure Documentation

59.2.5.1 struct `rcm_reset_pin_filter_config_t`

Data Fields

- bool `filterInStop`
Reset pin filter select in stop mode.
- `rcm_filter_run_wait_modes_t filterInRunWait`
Reset pin filter in run/wait mode.
- `uint8_t busClockFilterCount`
Reset pin bus clock filter width.

RCM HAL driver

59.2.5.1.0.10 Field Documentation

59.2.5.1.0.10.1 `bool rcm_reset_pin_filter_config_t::filterInStop`

59.2.5.1.0.10.2 `rcm_filter_run_wait_modes_t rcm_reset_pin_filter_config_t::filterInRunWait`

59.2.5.1.0.10.3 `uint8_t rcm_reset_pin_filter_config_t::busClockFilterCount`

59.2.6 Enumeration Type Documentation

59.2.6.1 `enum rcm_source_names_t`

Enumerator

kRcmSrcAll Parameter could get all reset flags.
kRcmWakeup Low-leakage wakeup reset.
kRcmLowVoltDetect low voltage detect reset
kRcmWatchDog Watchdog reset.
kRcmExternalPin External pin reset.
kRcmPowerOn Power on reset.
kRcmCoreLockup Core lockup reset.
kRcmSoftware Software reset.
kRcmMdmAp MDM-AP system reset.
kRcmStopModeAckErr Stop mode ACK error reset.

59.2.6.2 `enum rcm_filter_run_wait_modes_t`

Enumerator

kRcmFilterDisabled All filtering disabled.
kRcmFilterBusClk Bus clock filter enabled.
kRcmFilterLpoClk LPO clock filter enabled.
kRcmFilterReserverd Reserved setting.

59.2.7 Function Documentation

59.2.7.1 `uint32_t RCM_HAL_GetSrcStatus (RCM_Type * base, uint32_t statusMask)`

This function gets the current reset source status for a specified source.

Example:

```
uint32_t resetStatus;

// To get all reset source statuses.
resetStatus = RCM_HAL_GetSrcStatus(RCM, kRcmSrcAll);
```

```
// To test whether MCU is reset by watchdog.
resetStatus = RCM_HAL_GetSrcStatus(RCM, kRcmWatchDog);

// To test multiple reset source.
resetStatus = RCM_HAL_GetSrcStatus(RCM, kRcmWatchDog |
    kRcmSoftware);
```

Parameters

| | |
|-------------------|--|
| <i>base</i> | Register base address of RCM |
| <i>statusMask</i> | Bit mask for the reset sources to get. |

Returns

The reset source status.

**59.2.7.2 void RCM_HAL_SetResetPinFilterConfig (RCM_Type * *base*,
rcm_reset_pin_filter_config_t * *config*)**

This function sets the reset pin filter, including filter source, filter width, and so on.

Parameters

| | |
|---------------|---|
| <i>base</i> | Register base address of RCM |
| <i>config</i> | Pointer to the configuration structure. |

Chapter 60

Random Number Generator Accelerator (RNGA)

60.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Random Number Generator Accelerator (RNGA) block of Kinetis devices.

Modules

- [RNGA HAL driver](#)
- [RNGA Peripheral Driver](#)

RNGA HAL driver

60.2 RNGA HAL driver

60.2.1 Overview

This section describes the programming interface of the RNGA HAL driver.

Macros

- #define `MAX_COUNT` 4096
The maximum CPU clock cycles that the RNGA module uses to get new random data.

Enumerations

- enum `rnga_mode_t` {
 `kRNGAModeNormal` = 0U,
 `kRNGAModeSleep` = 1U }
RNGA working mode.
- enum `rnga_output_reg_level_t` {
 `kRNGAOutputRegLevelNowords` = 0U,
 `kRNGAOutputRegLevelOneword` = 1U }
Defines the value of output register level.
- enum `rnga_status_t` {
 `kStatus_RNGA_Success` = 0U,
 `kStatus_RNGA_InvalidArgument` = 1U,
 `kStatus_RNGA_Underflow` = 2U,
 `kStatus_RNGA_Timeout` = 3U,
 `kStatus_RNGA_OSError` = 4U }
Status structure for RNGA.

RNGA HAL.

- static void `RNGA_HAL_Init` (RNG_Type *base)
Initializes the RNGA module.
- static void `RNGA_HAL_Enable` (RNG_Type *base)
Enables the RNGA module.
- static void `RNGA_HAL_Disable` (RNG_Type *base)
Disables the RNGA module.
- static void `RNGA_HAL_SetHighAssuranceCmd` (RNG_Type *base, bool enable)
Sets the RNGA high assurance.
- static void `RNGA_HAL_SetIntMaskCmd` (RNG_Type *base, bool enable)
Sets the RNGA interrupt mask.
- static void `RNGA_HAL_ClearIntFlag` (RNG_Type *base, bool enable)
Clears the RNGA interrupt.
- static void `RNGA_HAL_SetWorkModeCmd` (RNG_Type *base, `rnga_mode_t` mode)
Sets the RNGA in sleep mode or normal mode.

- static uint8_t [RNGA_HAL_GetOutputRegSize](#) (RNG_Type *base)
Gets the output register size.
- static [rnga_output_reg_level_t](#) [RNGA_HAL_GetOutputRegLevel](#) (RNG_Type *base)
Gets the output register level.
- static [rnga_mode_t](#) [RNGA_HAL_GetWorkMode](#) (RNG_Type *base)
Gets the RNGA working mode.
- static bool [RNGA_HAL_GetErrorIntCmd](#) (RNG_Type *base)
Gets the RNGA status whether an error interrupt has occurred.
- static bool [RNGA_HAL_GetOutputRegUnderflowCmd](#) (RNG_Type *base)
Gets the RNGA status whether an output register underflow has occurred.
- static bool [RNGA_HAL_GetLastReadStatusCmd](#) (RNG_Type *base)
Gets the most recent RNGA read status.
- static bool [RNGA_HAL_GetSecurityViolationCmd](#) (RNG_Type *base)
Gets the RNGA status whether a security violation has occurred.
- static uint32_t [RNGA_HAL_ReadRandomData](#) (RNG_Type *base)
Gets random data from the RNGA.
- [rnga_status_t](#) [RNGA_HAL_GetRandomData](#) (RNG_Type *base, uint32_t *data)
Gets random data.
- static void [RNGA_HAL_WriteSeed](#) (RNG_Type *base, uint32_t data)
Inputs an entropy value used to seed the RNGA.

60.2.2 Enumeration Type Documentation

60.2.2.1 enum [rnga_mode_t](#)

Enumerator

- kRNGAModeNormal*** Normal Mode.
- kRNGAModeSleep*** Sleep Mode.

60.2.2.2 enum [rnga_output_reg_level_t](#)

Enumerator

- kRNGAOutputRegLevelNowords*** Output register no words.
- kRNGAOutputRegLevelOneword*** Output register one word.

60.2.2.3 enum [rnga_status_t](#)

This structure holds the return code of RNGA module.

Enumerator

- kStatus_RNGA_Success*** Success.
- kStatus_RNGA_InvalidArgument*** Invalid argument.
- kStatus_RNGA_Underflow*** Underflow.

RNGA HAL driver

kStatus_RNGA_Timeout Timeout.

kStatus_RNGA_OSAError Failure of OS abstraction layer.

60.2.3 Function Documentation

60.2.3.1 static void RNGA_HAL_Init (RNG_Type * *base*) [inline], [static]

This function initializes the RNGA to a default state.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

60.2.3.2 static void RNGA_HAL_Enable (RNG_Type * *base*) [inline], [static]

This function enables the RNGA random data generation and loading.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

60.2.3.3 static void RNGA_HAL_Disable (RNG_Type * *base*) [inline], [static]

This function disables the RNGA module.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

60.2.3.4 static void RNGA_HAL_SetHighAssuranceCmd (RNG_Type * *base*, bool *enable*) [inline], [static]

This function sets the RNGA high assurance (notification of security violations).

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

| | |
|---------------|--|
| <i>enable</i> | 0 means notification of security violations disabled. 1 means notification of security violations enabled. |
|---------------|--|

**60.2.3.5 static void RNGA_HAL_SetIntMaskCmd (RNG_Type * *base*, bool *enable*)
[inline], [static]**

This function sets the RNGA error interrupt mask.

Parameters

| | |
|---------------|---|
| <i>base</i> | RNGA base address |
| <i>enable</i> | 0 means unmask RNGA interrupt. 1 means mask RNGA interrupt. |

**60.2.3.6 static void RNGA_HAL_ClearIntFlag (RNG_Type * *base*, bool *enable*)
[inline], [static]**

This function clears the RNGA interrupt.

Parameters

| | |
|---------------|--|
| <i>base</i> | RNGA base address |
| <i>enable</i> | 0 means do not clear the interrupt. 1 means clear the interrupt. |

**60.2.3.7 static void RNGA_HAL_SetWorkModeCmd (RNG_Type * *base*, rnga_mode_t
mode) [inline], [static]**

This function specifies whether the RNGA is in sleep mode or normal mode.

Parameters

| | |
|-------------|---|
| <i>base</i> | RNGA base address |
| <i>mode</i> | kRNGAModeNormal means set RNGA in normal mode. kRNGAModeSleep means set RNGA in sleep mode. |

**60.2.3.8 static uint8_t RNGA_HAL_GetOutputRegSize (RNG_Type * *base*) [inline],
[static]**

This function gets the size of the output register as 32-bit random data words it can hold.

RNGA HAL driver

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

Returns

1 means one word(this value is fixed).

60.2.3.9 `static rnga_output_reg_level_t RNGA_HAL_GetOutputRegLevel (RNG_Type * base) [inline], [static]`

This function gets the number of random-data words that are in OR [RANDOUT], which indicates if OR is valid.

Parameters

| | |
|------------------|--------------|
| <i>base,RNGA</i> | base address |
|------------------|--------------|

Returns

0 means no words(empty), 1 means one word(valid).

60.2.3.10 `static rnga_mode_t RNGA_HAL_GetWorkMode (RNG_Type * base) [inline], [static]`

This function checks whether the RNGA works in sleep mode or normal mode.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

Returns

Kmode_RNGA_Normal means in normal mode Kmode_RNGA_Sleep means in sleep mode

60.2.3.11 `static bool RNGA_HAL_GetErrorIntCmd (RNG_Type * base) [inline], [static]`

This function gets the RNGA status whether an OR underflow condition has occurred since the error interrupt was last cleared or the RNGA was reset.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

Returns

0 means no underflow, 1 means underflow

**60.2.3.12 static bool RNGA_HAL_GetOutputRegUnderflowCmd (RNG_Type * *base*)
[inline], [static]**

This function gets the RNGA status whether an OR underflow condition has occurred since the register (SR) was last read or the RNGA was reset.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

Returns

0 means no underflow, 1 means underflow

**60.2.3.13 static bool RNGA_HAL_GetLastReadStatusCmd (RNG_Type * *base*)
[inline], [static]**

This function gets the RNGA status whether the most recent read of OR[RANDOUT] causes an OR underflow condition.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

Returns

0 means no underflow, 1 means underflow

**60.2.3.14 static bool RNGA_HAL_GetSecurityViolationCmd (RNG_Type * *base*)
[inline], [static]**

This function gets the RNGA status whether a security violation has occurred when high assurance is enabled.

RNGA HAL driver

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

Returns

0 means no security violation, 1 means security violation

60.2.3.15 `static uint32_t RNGA_HAL_ReadRandomData (RNG_Type * base)`
`[inline], [static]`

This function gets random data from the RNGA.

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | RNGA base address |
|-------------|-------------------|

Returns

random data obtained

60.2.3.16 `rnga_status_t RNGA_HAL_GetRandomData (RNG_Type * base, uint32_t * data)`

This function gets random data from RNGA.

Parameters

| | |
|-------------|---|
| <i>base</i> | RNGA base address |
| <i>data</i> | pointer address used to store random data |

Returns

one random data

60.2.3.17 `static void RNGA_HAL_WriteSeed (RNG_Type * base, uint32_t data)`
`[inline], [static]`

This function specifies an entropy value that RNGA uses with its ring oscillations to seed its pseudo-random algorithm.

Parameters

| | |
|-------------|------------------------|
| <i>base</i> | RNGA base address |
| <i>data</i> | external entropy value |

RNGA Peripheral Driver

60.3 RNGA Peripheral Driver

60.3.1 Overview

This section describes the programming interface of the RNGA Peripheral driver. The RNGA driver provides an easy way to initialize and configure the RNGA.

60.3.2 RNGA Initialization

1. To initialize the RNGA module, call the [RNGA_DRV_Init\(\)](#) function and pass the user configuration structure. This function automatically enables the RNGA module and clock.
2. After calling the [RNGA_DRV_Init\(\)](#) function, the RNGA is enabled and the counter starts working.

This example code shows how to initialize and configure the driver:

```
// Define device configuration.
const rnga_user_config_t init =
{
    .isIntMasked = true, // Mask RNGA Error Interrupt //
    .highAssuranceEnable = true, // Enable high assurance //
};

// Initialize RNGA.
RNGA_DRV_Init(&init);
```

60.3.3 RNGA Set/Get Working Mode

The RNGA works either in sleep mode or normal mode

1. [RNGA_DRV_SetMode\(\)](#) function sets the RNGA mode.
2. [RNGA_DRV_GetMode\(\)](#) function gets the RNGA working mode.

60.3.4 Get random data from RNGA

1. [RNGA_DRV_GetRandomData\(\)](#) function gets random data from the RNGA module.

60.3.5 Seed RNGA

1. [RNGA_DRV_Seed\(\)](#) function inputs an entropy value that the RNGA can use to seed the pseudo random algorithm.

60.3.6 RNGA interrupt

If the RNGA interrupt is enabled, the RNGA asserts an interrupt when an underflow error happens.

1. Enable the RNGA interrupt with the `rnga_user_config_t.isIntMasked = false`.
2. Define the RNGA IRQ function.

```
void RNGA_IRQHandler()
{
    // Enter RNGA ISR //
}
```

Data Structures

- struct `rnga_user_config_t`
Data structure for the RNGA initialization. [More...](#)

Macros

- #define `RNGA_DRV_RTOS_MULTI_THREAD (USE_RTOS)`
Enables/disables multi-thread support in RNGA driver.

Functions

- `rnga_status_t RNGA_DRV_Init` (uint32_t instance, const `rnga_user_config_t` *config)
Initializes the RNGA.
- void `RNGA_DRV_Deinit` (uint32_t instance)
Shuts down the RNGA.
- static void `RNGA_DRV_SetMode` (uint32_t instance, `rnga_mode_t` mode)
Sets the RNGA in normal mode or sleep mode.
- static `rnga_mode_t RNGA_DRV_GetMode` (uint32_t instance)
Gets the RNGA working mode.
- `rnga_status_t RNGA_DRV_GetRandomData` (uint32_t instance, void *data, uint32_t data_size)
Gets random data.
- static void `RNGA_DRV_Seed` (uint32_t instance, uint32_t seed)
Feeds the RNGA module.
- void `RNGA_DRV_IRQHandler` (uint32_t instance)
RNGA interrupt handler.

Variables

- RNG_Type *const `g_rngaBase` []
Table of base addresses for RNGA instances.
- const IRQn_Type `g_rngaIrqId` [RNG_INSTANCE_COUNT]
Table to save RNGA IRQ enumeration numbers defined in the CMSIS header file.

RNGA Peripheral Driver

60.3.7 Data Structure Documentation

60.3.7.1 struct rnga_user_config_t

This structure initializes the RNGA by calling the the rnga_init function. It contains all RNGA configurations.

Data Fields

- bool [isIntMasked](#)
Masks the triggering of error interrupt.
- bool [highAssuranceEnable](#)
Enables notification of security violations.

60.3.8 Macro Definition Documentation

60.3.8.1 #define RNGA_DRV_RTOS_MULTI_THREAD (USE_RTOS)

It is achieved by mutex locking of critical sections. It is enabled by default for RTOS. It is optional and may be disabled if TRNG is used only by one RTOS task.

60.3.9 Function Documentation

60.3.9.1 rnga_status_t RNGA_DRV_Init (uint32_t instance, const rnga_user_config_t * config)

This function initializes the RNGA. When called, the RNGA runs immediately according to the specifications in the configuration.

Parameters

| | |
|------------------------|---------------------------------------|
| <i>instance, RNGA</i> | instance ID |
| <i>config, pointer</i> | to initialize configuration structure |

Returns

RNGA status

60.3.9.2 void RNGA_DRV_Deinit (uint32_t instance)

This function shuts down the RNGA.

Parameters

| | |
|----------------------|-------------|
| <i>instance,RNGA</i> | instance ID |
|----------------------|-------------|

60.3.9.3 static void RNGA_DRV_SetMode (uint32_t *instance*, rnga_mode_t *mode*)
[inline], [static]

This function sets the RNGA in sleep mode or normal mode.

Parameters

| | |
|----------------------|--------------------|
| <i>instance,RNGA</i> | instance ID |
| <i>mode,normal</i> | mode or sleep mode |

60.3.9.4 static rnga_mode_t RNGA_DRV_GetMode (uint32_t *instance*) [inline],
[static]

This function gets the RNGA working mode.

Parameters

| | |
|----------------------|-------------|
| <i>instance,RNGA</i> | instance ID |
|----------------------|-------------|

Returns

normal mode or sleep mode

60.3.9.5 rnga_status_t RNGA_DRV_GetRandomData (uint32_t *instance*, void * *data*,
uint32_t *data_size*)

This function gets random data from the RNGA.

Parameters

| | |
|----------------------|--|
| <i>instance,RNGA</i> | instance ID |
| <i>data</i> | pointer to user buffer to be filled by random data size of data in bytes |

RNGA Peripheral Driver

Returns

RNGA status

60.3.9.6 static void RNGA_DRV_Seed (uint32_t *instance*, uint32_t *seed*) [inline], [static]

This function inputs an entropy value that the RNGA uses to seed its pseudo-random algorithm.

Parameters

| | |
|----------------------|-------------|
| <i>instance,RNGA</i> | instance ID |
| <i>seed,input</i> | seed value |

60.3.9.7 void RNGA_DRV_IRQHandler (uint32_t *instance*)

This function handles the error interrupt caused by the RNGA underflow.

Parameters

| | |
|----------------------|-------------|
| <i>instance,RNGA</i> | instance ID |
|----------------------|-------------|

60.3.10 Variable Documentation

60.3.10.1 RNG_Type* const g_rngaBase[]

60.3.10.2 const IRQn_Type g_rngalrqId[RNG_INSTANCE_COUNT]

Chapter 61

Real Time Clock (RTC)

61.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Real Time Clock (RTC) block of Kinetis devices.

Note that on platforms that do not have a 32 KHz clock input for the RTC module, the RTC alarms may be inaccurate by a few seconds. For platforms that use the 1 KHz LPO clock as an input to the RTC, the date and time drift away from the wall clock because the LPO clock is not guaranteed to provide exactly 1 KHz (details can be found in the datasheet).

Modules

- [RTC HAL driver](#)
- [RTC Peripheral Driver](#)

RTC HAL driver

61.2 RTC HAL driver

61.2.1 Overview

This section describes the programming interface of the RTC HAL driver. The RTC HAL driver initializes the RTC registers and provides functions to read or modify the RTC registers. These are mostly invoked by the RTC Peripheral driver.

61.2.2 RTC Initialization

The HAL driver provides an initialization function ([RTC_HAL_Init\(\)](#)) to reset the RTC module.

61.2.3 RTC Setting and reading the RTC time

The HAL driver provides [RTC_HAL_SetDatetime\(\)](#) and [RTC_HAL_GetDatetime\(\)](#) functions to set and read the date and time using an instantiation of the `rtc_datetime_t` structure. These are the structure details:

```
typedef struct RtcDatetime
{
    uint16_t year;
    uint16_t month;
    uint16_t day;
    uint16_t hour;
    uint16_t minute;
    uint8_t second;
} rtc_datetime_t;
```

The HAL driver also provides the ability to set and read the date and time in seconds using the [RTC_HAL_SetDatetimeInsecs\(\)](#) and [RTC_HAL_GetDatetimeInsecs\(\)](#) functions.

Note that, if the RTC counter clock is not 32 KHz, the [RTC_HAL_SetDatetime\(\)](#) and [RTC_HAL_GetDatetime\(\)](#) functions do not provide accurate results. On such boards, use the [RTC_HAL_SetDatetimeInsecs\(\)](#) and [RTC_HAL_GetDatetimeInsecs\(\)](#) functions and adjust the second calculation taking into account the clock source difference. The RTC peripheral driver adjusts its seconds calculation if the clock feeding RTC counter clock is not 32 KHz. Use the peripheral driver instead of calling the HAL functions directly.

61.2.4 IRTC Setting and reading the Alarm

The HAL driver provides [RTC_HAL_SetAlarm\(\)](#) and [RTC_HAL_GetAlarm\(\)](#) functions to set an alarm and read back the alarm time.

Data Structures

- struct [rtc_datetime_t](#)
Structure is used to hold the time in a simple "date" format. [More...](#)

Enumerations

- enum `rtc_status_t` {
`kStatusRtcSuccess` = 0x00U,
`kStatusRtcFail` = 0x01U }
Error codes for RTC driver.

RTC HAL API Functions

- void `RTC_HAL_Init` (RTC_Type *base)
Clears all interrupts.
- void `RTC_HAL_ConvertSecsToDatetime` (const uint32_t *seconds, rtc_datetime_t *datetime)
Converts seconds to date time format data structure.
- bool `RTC_HAL_IsDatetimeCorrectFormat` (const rtc_datetime_t *datetime)
Checks whether the date time structure elements have the information that is within the range.
- void `RTC_HAL_ConvertDatetimeToSecs` (const rtc_datetime_t *datetime, uint32_t *seconds)
Converts the date time format data structure to seconds.
- void `RTC_HAL_SetDatetime` (RTC_Type *base, const rtc_datetime_t *datetime)
Sets the RTC date and time according to a given time structure.
- void `RTC_HAL_SetDatetimeInSecs` (RTC_Type *base, const uint32_t seconds)
Sets the RTC date and time according to the given time provided in seconds.
- void `RTC_HAL_GetDatetime` (RTC_Type *base, rtc_datetime_t *datetime)
Gets the RTC time and stores it in the given time structure.
- void `RTC_HAL_GetDatetimeInSecs` (RTC_Type *base, uint32_t *seconds)
Gets the RTC time and returns it in seconds.
- void `RTC_HAL_GetAlarm` (RTC_Type *base, rtc_datetime_t *date)
Reads the value of the time alarm.
- bool `RTC_HAL_SetAlarm` (RTC_Type *base, const rtc_datetime_t *date)
Sets the RTC alarm time and enables the alarm interrupt.

RTC register access functions

- static uint32_t `RTC_HAL_GetSecsReg` (RTC_Type *base)
Reads the value of the time seconds counter.
- static void `RTC_HAL_SetSecsReg` (RTC_Type *base, const uint32_t seconds)
Writes to the time seconds counter.
- static void `RTC_HAL_SetAlarmReg` (RTC_Type *base, const uint32_t seconds)
Sets the time alarm and clears the time alarm flag.
- static uint32_t `RTC_HAL_GetAlarmReg` (RTC_Type *base)
Gets the time alarm register contents.
- static uint16_t `RTC_HAL_GetPrescaler` (RTC_Type *base)
Reads the value of the time prescaler.
- static void `RTC_HAL_SetPrescaler` (RTC_Type *base, const uint16_t prescale)
Sets the time prescaler.
- static uint32_t `RTC_HAL_GetCompensationReg` (RTC_Type *base)
Reads the time compensation register contents.
- static void `RTC_HAL_SetCompensationReg` (RTC_Type *base, const uint32_t compValue)
Writes the value to the RTC TCR register.

RTC HAL driver

- static uint8_t [RTC_HAL_GetCompensationIntervalCounter](#) (RTC_Type *base)
Reads the current value of the compensation interval counter, which is the field CIC in the RTC TCR register.
- static uint8_t [RTC_HAL_GetTimeCompensationValue](#) (RTC_Type *base)
Reads the current value used by the compensation logic for the present second interval.
- static uint8_t [RTC_HAL_GetCompensationIntervalRegister](#) (RTC_Type *base)
Reads the compensation interval register.
- static void [RTC_HAL_SetCompensationIntervalRegister](#) (RTC_Type *base, const uint8_t value)
Writes the compensation interval.
- static uint8_t [RTC_HAL_GetTimeCompensationRegister](#) (RTC_Type *base)
Reads the time compensation value which is the configured number of 32.768 kHz clock cycles in each second.
- static void [RTC_HAL_SetTimeCompensationRegister](#) (RTC_Type *base, const uint8_t comp-Value)
Writes to the field Time Compensation Register (TCR) of the RTC Time Compensation Register (RTC_TCR).
- static void [RTC_HAL_SetOsc2pfLoadCmd](#) (RTC_Type *base, bool enable)
Enables/disables the oscillator configuration for the 2pF load.
- static bool [RTC_HAL_GetOsc2pfLoad](#) (RTC_Type *base)
Reads the oscillator 2pF load configure bit.
- static void [RTC_HAL_SetOsc4pfLoadCmd](#) (RTC_Type *base, bool enable)
Enables/disables the oscillator configuration for the 4pF load.
- static bool [RTC_HAL_GetOsc4pfLoad](#) (RTC_Type *base)
Reads the oscillator 4pF load configuration bit.
- static void [RTC_HAL_SetOsc8pfLoadCmd](#) (RTC_Type *base, bool enable)
Enables/disables the oscillator configuration for the 8pF load.
- static bool [RTC_HAL_GetOsc8pfLoad](#) (RTC_Type *base)
Reads the oscillator 8pF load configuration bit.
- static void [RTC_HAL_SetOsc16pfLoadCmd](#) (RTC_Type *base, bool enable)
Enables/disables the oscillator configuration for the 16pF load.
- static bool [RTC_HAL_GetOsc16pfLoad](#) (RTC_Type *base)
Reads the oscillator 16pF load configuration bit.
- static void [RTC_HAL_SetClockOutCmd](#) (RTC_Type *base, bool enable)
Enables/disables the 32 kHz clock output to other peripherals.
- static bool [RTC_HAL_GetClockOutCmd](#) (RTC_Type *base)
Reads the RTC_CR CLKO bit.
- static void [RTC_HAL_SetOscillatorCmd](#) (RTC_Type *base, bool enable)
Enables/disables the oscillator.
- static bool [RTC_HAL_IsOscillatorEnabled](#) (RTC_Type *base)
Reads the RTC_CR OSCE bit.
- static void [RTC_HAL_SoftwareReset](#) (RTC_Type *base)
Performs a software reset on the RTC module.
- static void [RTC_HAL_SoftwareResetFlagClear](#) (RTC_Type *base)
Clears the software reset flag.
- static bool [RTC_HAL_ReadSoftwareResetStatus](#) (RTC_Type *base)
Reads the RTC_CR SWR bit.
- static bool [RTC_HAL_IsCounterEnabled](#) (RTC_Type *base)
Reads the time counter status (enabled/disabled).
- static void [RTC_HAL_EnableCounter](#) (RTC_Type *base, bool enable)
Changes the time counter status.
- static bool [RTC_HAL_HasAlarmOccured](#) (RTC_Type *base)

- *Checks whether the configured time alarm has occurred.*
- static bool [RTC_HAL_IsTimeInvalid](#) (RTC_Type *base)
- *Checks whether the time has been marked as invalid.*
- static bool [RTC_HAL_IsSecsIntEnabled](#) (RTC_Type *base)
- *Checks whether the Time Seconds Interrupt is enabled/disabled.*
- static void [RTC_HAL_SetSecsIntCmd](#) (RTC_Type *base, bool enable)
- *Enables/disables the Time Seconds Interrupt.*
- static bool [RTC_HAL_ReadAlarmInt](#) (RTC_Type *base)
- *Checks whether the Time Alarm Interrupt is enabled/disabled.*
- static void [RTC_HAL_SetAlarmIntCmd](#) (RTC_Type *base, bool enable)
- *Enables/disables the Time Alarm Interrupt.*
- static void [RTC_HAL_SetTimeOverflowIntCmd](#) (RTC_Type *base, bool enable)
- *Enables/disables the Time Overflow Interrupt.*
- static void [RTC_HAL_SetTimeInvalidIntCmd](#) (RTC_Type *base, bool enable)
- *Enables/disables the Time Invalid Interrupt.*

61.2.5 Data Structure Documentation

61.2.5.1 struct rtc_datetime_t

Data Fields

- uint16_t [year](#)
Range from 1970 to 2099.
- uint16_t [month](#)
Range from 1 to 12.
- uint16_t [day](#)
Range from 1 to 31 (depending on month).
- uint16_t [hour](#)
Range from 0 to 23.
- uint16_t [minute](#)
Range from 0 to 59.
- uint8_t [second](#)
Range from 0 to 59.

RTC HAL driver

61.2.5.1.0.11 Field Documentation

61.2.5.1.0.11.1 uint16_t rtc_datetime_t::year

61.2.5.1.0.11.2 uint16_t rtc_datetime_t::month

61.2.5.1.0.11.3 uint16_t rtc_datetime_t::day

61.2.5.1.0.11.4 uint16_t rtc_datetime_t::hour

61.2.5.1.0.11.5 uint16_t rtc_datetime_t::minute

61.2.5.1.0.11.6 uint8_t rtc_datetime_t::second

61.2.6 Enumeration Type Documentation

61.2.6.1 enum rtc_status_t

Enumerator

kStatusRtcSuccess RTC success status.

kStatusRtcFail RTC error status.

61.2.7 Function Documentation

61.2.7.1 void RTC_HAL_Init (RTC_Type * *base*)

This function initiates a soft-reset of the RTC module if the time invalid flag is set.

Parameters

| | |
|-------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
|-------------|-------------------------------|

61.2.7.2 void RTC_HAL_ConvertSecsToDatetime (const uint32_t * *seconds*, rtc_datetime_t * *datetime*)

Parameters

| | |
|----------------|--|
| <i>seconds</i> | holds the date and time information in seconds |
|----------------|--|

| | |
|-----------------|--|
| <i>datetime</i> | holds the converted information from seconds in date and time format |
|-----------------|--|

61.2.7.3 **bool RTC_HAL_IsDatetimeCorrectFormat (const rtc_datetime_t * *datetime*)**

Parameters

| | |
|-----------------|---|
| <i>datetime</i> | holds the date and time information that needs to be converted to seconds |
|-----------------|---|

Returns

returns true if the datetime argument has the right format, false otherwise

61.2.7.4 **void RTC_HAL_ConvertDatetimeToSecs (const rtc_datetime_t * *datetime*, uint32_t * *seconds*)**

Parameters

| | |
|-----------------|---|
| <i>datetime</i> | holds the date and time information that needs to be converted to seconds |
| <i>seconds</i> | holds the converted date and time in seconds |

61.2.7.5 **void RTC_HAL_SetDatetime (RTC_Type * *base*, const rtc_datetime_t * *datetime*)**

The function converts the data from the time structure to seconds and writes the seconds value to the RTC register. The RTC counter is started after setting the time.

Parameters

| | |
|-----------------|--|
| <i>base</i> | The RTC base address pointer |
| <i>datetime</i> | [in] Pointer to structure where the date and time details to set are stored. |

61.2.7.6 **void RTC_HAL_SetDatetimelnsecs (RTC_Type * *base*, const uint32_t *seconds*)**

The RTC counter is started after setting the time.

RTC HAL driver

Parameters

| | |
|----------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
| <i>seconds</i> | [in] Time in seconds |

61.2.7.7 void RTC_HAL_GetDatetime (RTC_Type * *base*, rtc_datetime_t * *datetime*)

The function reads the value in seconds from the RTC register. It then converts to the time structure which provides the time in date, hour, minutes, and seconds.

Parameters

| | |
|-----------------|--|
| <i>base</i> | The RTC base address pointer |
| <i>datetime</i> | [out] pointer to a structure where the date and time details are stored. |

61.2.7.8 void RTC_HAL_GetDatetimeInSecs (RTC_Type * *base*, uint32_t * *seconds*)

Parameters

| | |
|----------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>seconds</i> | [out] pointer to variable where the RTC time is stored in seconds |

61.2.7.9 void RTC_HAL_GetAlarm (RTC_Type * *base*, rtc_datetime_t * *date*)

Parameters

| | |
|-------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>date</i> | [out] pointer to a variable where the alarm date and time details are stored. |

61.2.7.10 bool RTC_HAL_SetAlarm (RTC_Type * *base*, const rtc_datetime_t * *date*)

The function checks whether the specified alarm time is greater than the present time. If not, the function does not set the alarm and returns an error.

Parameters

| | |
|-------------|--|
| <i>base</i> | The RTC base address pointer. |
| <i>date</i> | [in] pointer to structure where the alarm date and time details will be stored at. |

Returns

true: success in setting the RTC alarm
false: error in setting the RTC alarm.

61.2.7.11 static uint32_t RTC_HAL_GetSecsReg (RTC_Type * *base*) [inline], [static]

The time counter reads as zero if either the SR[TOF] or the SR[TIF] is set.

Parameters

| | |
|-------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
|-------------|-------------------------------|

Returns

contents of the seconds register.

61.2.7.12 static void RTC_HAL_SetSecsReg (RTC_Type * *base*, const uint32_t *seconds*) [inline], [static]

When the time counter is enabled, the TSR is read only and increments once every second provided the SR[TOF] or SR[TIF] is not set. When the time counter is disabled, the TSR can be read or written. Writing to the TSR when the time counter is disabled clears the SR[TOF] and/or the SR[TIF]. Writing to the TSR register with zero is supported, but not recommended, since the TSR reads as zero when either the SR[TIF] or the SR[TOF] is set (indicating the time is invalid).

Parameters

| | |
|----------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
| <i>seconds</i> | [in] seconds value. |

61.2.7.13 static void RTC_HAL_SetAlarmReg (RTC_Type * *base*, const uint32_t *seconds*) [inline], [static]

When the time counter is enabled, the SR[TAF] is set whenever the TAR[TAR] equals the TSR[TSR] and the TSR[TSR] increments. Writing to the TAR clears the SR[TAF].

RTC HAL driver

Parameters

| | |
|----------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
| <i>seconds</i> | [in] alarm value in seconds. |

61.2.7.14 `static uint32_t RTC_HAL_GetAlarmReg (RTC_Type * base) [inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

contents of the alarm register.

61.2.7.15 `static uint16_t RTC_HAL_GetPrescaler (RTC_Type * base) [inline], [static]`

The time counter reads as zero when either the SR[TOF] or the SR[TIF] is set.

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

contents of the time prescaler register.

61.2.7.16 `static void RTC_HAL_SetPrescaler (RTC_Type * base, const uint16_t prescale) [inline], [static]`

When the time counter is enabled, the TPR is read only and increments every 32.768 kHz clock cycle. When the time counter is disabled, the TPR can be read or written. The TSR[TSR] increments when bit 14 of the TPR transitions from a logic one to a logic zero.

Parameters

| | |
|-----------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
| <i>prescale</i> | Prescaler value |

61.2.7.17 `static uint32_t RTC_HAL_GetCompensationReg (RTC_Type * base)`
`[inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

time compensation register contents.

61.2.7.18 `static void RTC_HAL_SetCompensationReg (RTC_Type * base, const uint32_t`
`compValue) [inline], [static]`

Parameters

| | |
|------------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>compValue</i> | value to be written to the compensation register. |

61.2.7.19 `static uint8_t RTC_HAL_GetCompensationIntervalCounter (RTC_Type * base)`
`[inline], [static]`

Parameters

| | |
|-------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
|-------------|-------------------------------|

Returns

compensation interval value.

61.2.7.20 `static uint8_t RTC_HAL_GetTimeCompensationValue (RTC_Type * base)`
`[inline], [static]`

RTC HAL driver

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

time compensation value

61.2.7.21 `static uint8_t RTC_HAL_GetCompensationIntervalRegister (RTC_Type * base) [inline], [static]`

The value is the configured compensation interval in seconds from 1 to 256 to control how frequently the time compensation register should adjust the number of 32.768 kHz cycles in each second. The value is one less than the number of seconds (for example, zero means a configuration for a compensation interval of one second).

Parameters

| | |
|-------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
|-------------|-------------------------------|

Returns

compensation interval in seconds.

61.2.7.22 `static void RTC_HAL_SetCompensationIntervalRegister (RTC_Type * base, const uint8_t value) [inline], [static]`

This configures the compensation interval in seconds from 1 to 256 to control how frequently the TCR should adjust the number of 32.768 kHz cycles in each second. The value written should be one less than the number of seconds (for example, write zero to configure for a compensation interval of one second). This register is double buffered and writes do not take affect until the end of the current compensation interval.

Parameters

| | |
|--------------|----------------------------------|
| <i>base</i> | The RTC base address pointer. |
| <i>value</i> | the compensation interval value. |

61.2.7.23 `static uint8_t RTC_HAL_GetTimeCompensationRegister (RTC_Type * base) [inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

time compensation value.

61.2.7.24 `static void RTC_HAL_SetTimeCompensationRegister (RTC_Type * base, const uint8_t compValue) [inline], [static]`

Configures the number of 32.768 kHz clock cycles in each second. This register is double buffered and writes do not take affect until the end of the current compensation interval.

Parameters

| | |
|------------------|---------------------------------|
| <i>base</i> | The RTC base address pointer |
| <i>compValue</i> | value of the time compensation. |

61.2.7.25 `static void RTC_HAL_SetOsc2pfLoadCmd (RTC_Type * base, bool enable) [inline], [static]`

Parameters

| | |
|---------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: enables load -false: disables load. |

61.2.7.26 `static bool RTC_HAL_GetOsc2pfLoad (RTC_Type * base) [inline], [static]`

RTC HAL driver

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: 2pF additional load enabled. false: 2pF additional load disabled.

61.2.7.27 static void RTC_HAL_SetOsc4pfLoadCmd (RTC_Type * *base*, bool *enable*) [inline], [static]

Parameters

| | |
|---------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: enables load. -false: disables load |

61.2.7.28 static bool RTC_HAL_GetOsc4pfLoad (RTC_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: 4pF additional load enabled. false: 4pF additional load disabled.

61.2.7.29 static void RTC_HAL_SetOsc8pfLoadCmd (RTC_Type * *base*, bool *enable*) [inline], [static]

Parameters

| | |
|---------------|--|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: enables load. -false: disables load. |

61.2.7.30 `static bool RTC_HAL_GetOsc8pfLoad (RTC_Type * base) [inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: 8pF additional load enabled. false: 8pF additional load disabled.

61.2.7.31 `static void RTC_HAL_SetOsc16pfLoadCmd (RTC_Type * base, bool enable) [inline], [static]`

Parameters

| | |
|---------------|--|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: enables load. -false: disables load. |

61.2.7.32 `static bool RTC_HAL_GetOsc16pfLoad (RTC_Type * base) [inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: 16pF additional load enabled. false: 16pF additional load disabled.

61.2.7.33 `static void RTC_HAL_SetClockOutCmd (RTC_Type * base, bool enable) [inline], [static]`

RTC HAL driver

Parameters

| | |
|---------------|--|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: enables clock out. -false: disables clock out. |

61.2.7.34 `static bool RTC_HAL_GetClockOutCmd (RTC_Type * base) [inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: 32 kHz clock is not output to other peripherals. false: 32 kHz clock is output to other peripherals.

61.2.7.35 `static void RTC_HAL_SetOscillatorCmd (RTC_Type * base, bool enable) [inline], [static]`

After enabling, waits for the oscillator startup time before enabling the time counter to allow the 32.768 kHz clock time to stabilize.

Parameters

| | |
|---------------|--|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: enables oscillator. -false: disables oscillator. |

61.2.7.36 `static bool RTC_HAL_IsOscillatorEnabled (RTC_Type * base) [inline], [static]`

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: 32.768 kHz oscillator is enabled false: 32.768 kHz oscillator is disabled.

61.2.7.37 static void RTC_HAL_SoftwareReset (RTC_Type * *base*) [inline], [static]

This resets all RTC registers except for the SWR bit and the RTC_WAR and RTC_RAR registers. The SWR bit is cleared after VBAT POR and by software explicitly clearing it. Note that access control features (RTC_WAR and RTC_RAR registers) are not available in all MCUs.

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

61.2.7.38 static void RTC_HAL_SoftwareResetFlagClear (RTC_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

61.2.7.39 static bool RTC_HAL_ReadSoftwareResetStatus (RTC_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: SWR is set. false: SWR is cleared.

61.2.7.40 static bool RTC_HAL_IsCounterEnabled (RTC_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

RTC HAL driver

Returns

-true: time counter is enabled, time seconds register and time prescaler register are not writeable, but increment. -false: time counter is disabled, time seconds register and time prescaler register are writeable, but do not increment.

61.2.7.41 static void RTC_HAL_EnableCounter (RTC_Type * *base*, bool *enable*) [inline], [static]

Parameters

| | |
|---------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: enables the time counter -false: disables the time counter. |

61.2.7.42 static bool RTC_HAL_HasAlarmOccured (RTC_Type * *base*) [inline], [static]

Reads time alarm flag (TAF). This flag is set when the time alarm register (TAR) equals the time seconds register (TSR) and the TSR increments. This flag is cleared by writing the TAR register.

Parameters

| | |
|-------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
|-------------|-------------------------------|

Returns

-true: time alarm has occurred. -false: no time alarm occurred.

61.2.7.43 static bool RTC_HAL_IsTimeInvalid (RTC_Type * *base*) [inline], [static]

Reads the value of RTC Status Register (RTC_SR), field Time Invalid Flag (TIF). This flag is set on VB-AT POR or software reset. The TSR and TPR do not increment and read as zero when this bit is set. This flag is cleared by writing the TSR register when the time counter is disabled.

Parameters

| | |
|-------------|-------------------------------|
| <i>base</i> | The RTC base address pointer. |
|-------------|-------------------------------|

Returns

-true: time is INVALID and time counter is zero. -false: time is valid.

61.2.7.44 static bool RTC_HAL_IsSecsIntEnabled (RTC_Type * *base*) [inline], [static]

Reads the value of field Time Seconds Interrupt Enable (TSIE) of the RTC Interrupt Enable Register (RTC_IER). The seconds interrupt is an edge-sensitive interrupt with a dedicated interrupt vector. It is generated once a second and requires no software overhead (there is no corresponding status flag to clear).

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

-true: Seconds interrupt is enabled. -false: Seconds interrupt is disabled.

61.2.7.45 static void RTC_HAL_SetSecsIntCmd (RTC_Type * *base*, bool *enable*) [inline], [static]

Writes to the field Time Seconds Interrupt Enable (TSIE) of the RTC Interrupt Enable Register (RTC_IER). Note: The seconds interrupt is an edge-sensitive interrupt with a dedicated interrupt vector. It is generated once a second and requires no software overhead (there is no corresponding status flag to clear).

Parameters

| | |
|---------------|--|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: Seconds interrupt is enabled. -false: Seconds interrupt is disabled. |

RTC HAL driver

61.2.7.46 `static bool RTC_HAL_ReadAlarmInt (RTC_Type * base) [inline], [static]`

Reads the field Time Alarm Interrupt Enable (TAIE) value of the RTC Interrupt Enable Register (RTC_IER).

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

Returns

true: Time alarm flag does generate an interrupt. false: Time alarm flag does not generate an interrupt.

61.2.7.47 `static void RTC_HAL_SetAlarmIntCmd (RTC_Type * base, bool enable) [inline], [static]`

Writes to the field Time Alarm Interrupt Enable (TAIE) of the RTC Interrupt Enable Register (RTC_IER).

Parameters

| | |
|---------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: Time alarm flag does generate an interrupt. -false: Time alarm flag does not generate an interrupt. |

61.2.7.48 `static void RTC_HAL_SetTimeOverflowIntCmd (RTC_Type * base, bool enable) [inline], [static]`

Writes to the field Time Overflow Interrupt Enable (TOIE) of the RTC Interrupt Enable Register (RTC_IER).

Parameters

| | |
|-------------|------------------------------|
| <i>base</i> | The RTC base address pointer |
|-------------|------------------------------|

| | |
|---------------|---|
| <i>enable</i> | can be true or false -true: Time overflow flag does generate an interrupt. -false: Time overflow flag does not generate an interrupt. |
|---------------|---|

**61.2.7.49 static void RTC_HAL_SetTimeInvalidIntCmd (RTC_Type * *base*, bool *enable*)
[inline], [static]**

Writes to the field Time Invalid Interrupt Enable (TIIE) of the RTC Interrupt Enable Register (RTC_IER).

Parameters

| | |
|---------------|---|
| <i>base</i> | The RTC base address pointer |
| <i>enable</i> | can be true or false -true: Time invalid flag does generate an interrupt. -false: Time invalid flag does not generate an interrupt. |

RTC Peripheral Driver

61.3 RTC Peripheral Driver

61.3.1 Overview

This section describes the programming interface of the RTC Peripheral Driver. The RTC Peripheral driver sets and gets the RTC clock, sets and reads the RTC alarm time, and receives notifications when an alarm is triggered.

61.3.2 RTC Peripheral Driver Initialization

To initialize, the user calls the [RTC_DRV_Init\(\)](#) function with the RTC instance number. Most SoCs have only one RTC instance. Therefore, the instance number is zero. The driver initialization function un-gates the RTC module clock, initializes the RTC HAL layer driver, and enables the RTC interrupts.

This is an example how to create the `rtc_init()` function.

```
// init the rtc module //
RTC_DRV_Init(0);
```

61.3.3 IRTCS Setting and reading the IRTC time

The RTC driver uses an instantiation of the `rtc_datetime_t` structure either to configure or read the date and time. Call the [RTC_DRV_SetDatetime\(\)](#) function to configure the current date and time and call the [RTC_DRV_GetDatetime\(\)](#) function to read the current date and time at a later time. This example shows how to use these functions.

```
rtc_datetime_t datetimeToSet;

RTC_DRV_Init(0);

datetimeToSet.year = 2013;
datetimeToSet.month = 10;
datetimeToSet.day = 13;
datetimeToSet.hour = 18;
datetimeToSet.minute = 55;
datetimeToSet.second = 30;

// set the datetime //
result = RTC_DRV_SetDatetime(0, &datetime);

// get datetime //
RTC_DRV_GetDatetime(0, &datetime);
printf("Current datetime: %04hd-%02hd-%02hd %02hd:%02hd:%02hd\r\n",
       datetime.year, datetime.month, datetime.day,
       datetime.hour, datetime.minute, datetime.second);
```

61.3.4 RTC Triggering an Alarm

Call the [RTC_DRV_SetAlarm\(\)](#) function to set the alarm time and call the [RTC_DRV_GetAlarm\(\)](#) function to read the configured alarm time. Set the current time using the steps mentioned earlier prior to using

the call to set the alarm time. The user can enable the option to trigger an interrupt when an alarm occurs. This is done by either calling the `RTC_DRV_SetAlarmIntCmd()` function or through an argument to the `RTC_DRV_SetAlarm()` function. This is an example to set an RTC alarm. This example causes an alarm interrupt to be triggered after 5 minutes.

```
rtc_datetime_t datetimeToSet;
rtc_datetime_t alarmTimeToSet;

RTC_DRV_Init(0);

datetimeToSet.year = 2013;
datetimeToSet.month = 10;
datetimeToSet.day = 13;
datetimeToSet.hour = 18;
datetimeToSet.minute = 55;
datetimeToSet.second = 30;

RTC_DRV_SetDatetime(0, &datetimeToSet);

alarmTimeToSet.year = datetimeToSet.year;
alarmTimeToSet.month = datetimeToSet.month;
alarmTimeToSet.day = datetimeToSet.day;
alarmTimeToSet.minute = datetimeToSet.minute + 5;
alarmTimeToSet.second = datetimeToSet.second;
RTC_DRV_SetAlarm(0, &alarmTimeToSet, true);
```

61.3.5 RTC Repeated alarm

To request a repeated alarm, a configuration structure is available to configure the repeat alarm information. These are the structure details:

```
typedef struct RtcRepeatAlarmState
{
    rtc_datetime_t alarmTime;
    rtc_datetime_t alarmRepTime;
} rtc_repeat_alarm_state_t;
```

Call the `RTC_DRV_InitRepeatAlarm()` function and provide the repeat alarm configuration structure to the RTC driver. The user should not free this structure because the RTC driver stores the pointer to this structure to configure the future alarm times.

This is an example to set a RTC repeat alarm. The alarm interrupt is triggered after 5 minutes and every minute after that.

```
rtc_repeat_alarm_state_t alarm_state;

rtc_datetime_t alarmTimeToSet;
rtc_datetime_t alarmReptime;
rtc_datetime_t datetimeToSet;

RTC_DRV_Init(0);
RTC_DRV_InitRepeatAlarm(0, &alarm_state);
RTC_DRV_SetDatetime(0, &datetimeToSet);

alarmTimeToSet.minute = datetimeToSet.minute + 5;
```

RTC Peripheral Driver

```

alarmReptime.year = 0;
alarmReptime.month = 0;
alarmReptime.day = 0;
alarmReptime.hour = 0;
alarmReptime.minute = 1;

if(!RTC_DRV_SetAlarmRepeat(0, &alarmTimeToSet, &alarmReptime))
{
    exit_error();
}

```

61.3.6 RTC Enable and Disable Alarm Interrupts

Call the [RTC_DRV_SetAlarmIntCmd\(\)](#) function to enable or disable the RTC alarm interrupt. Call the [RTC_DRV_GetAlarmIntCmd\(\)](#) function to get the state of the RTC alarm interrupt bit.

61.3.7 RTC Interrupt handler

The RTC driver provides an interrupt handler for the seconds and alarm interrupts. These handlers clear the status bits. When the repeated alarm is requested, the alarm interrupt handler uses the information provided in the [rtc_repeat_alarm_state_t](#) structure to schedule the next alarm.

To add more actions to the default handler, add calls to the functions inside the interrupt handlers [RTC_IRQHandler\(\)](#) and [RTC_Seconds_IRQHandler\(\)](#) functions.

Data Structures

- struct [rtc_repeat_alarm_state_t](#)
RTC repeated alarm information used by the RTC driver. [More...](#)

Functions

- bool [RTC_DRV_IsCounterEnabled](#) (uint32_t instance)
Checks whether the RTC is enabled.
- void [RTC_DRV_SetSecsIntCmd](#) (uint32_t instance, bool secondsEnable)
Enables or disables the RTC seconds interrupt.
- void [RTC_DRV_SetAlarmIntCmd](#) (uint32_t instance, bool alarmEnable)
Enables or disables the alarm interrupt.
- bool [RTC_DRV_GetAlarmIntCmd](#) (uint32_t instance)
Reads the alarm interrupt.
- bool [RTC_DRV_IsAlarmPending](#) (uint32_t instance)
Reads the alarm status to see if the alarm is triggered.
- void [RTC_DRV_SetTimeCompensation](#) (uint32_t instance, uint32_t compensationInterval, uint32_t compensationTime)
Writes the compensation value to the RTC compensation register.
- void [RTC_DRV_GetTimeCompensation](#) (uint32_t instance, uint32_t *compensationInterval, uint32_t *compensationTime)

- *Reads the compensation value from the RTC compensation register.*
- void [RTC_DRV_AlarmIntAction](#) (uint32_t instance)
Action to take when an RTC alarm interrupt is triggered.
- void [RTC_DRV_SecsIntAction](#) (uint32_t instance)
Action to take when an RTC seconds interrupt is triggered.

Variables

- RTC_Type *const [g_rtcBase](#) [RTC_INSTANCE_COUNT]
Table of base addresses for RTC instances.
- const IRQn_Type [g_rtcIrqId](#) [RTC_INSTANCE_COUNT]
Table to save RTC Alarm IRQ numbers for RTC instances.
- const IRQn_Type [g_rtcSecondsIrqId](#) [RTC_INSTANCE_COUNT]
Table to save RTC Seconds IRQ numbers for RTC instances.

Initialization and Deinitialization

- [rtc_status_t RTC_DRV_Init](#) (uint32_t instance)
Initializes the RTC module.
- void [RTC_DRV_Deinit](#) (uint32_t instance)
Disables the RTC module clock gate control.

RTC datetime set and get

- bool [RTC_DRV_SetDatetime](#) (uint32_t instance, [rtc_datetime_t](#) *datetime)
Sets the RTC date and time according to the given time structure.
- void [RTC_DRV_GetDatetime](#) (uint32_t instance, [rtc_datetime_t](#) *datetime)
Gets the RTC time and stores it in the given time structure.

RTC alarm

- bool [RTC_DRV_SetAlarm](#) (uint32_t instance, [rtc_datetime_t](#) *alarmTime, bool enableAlarmInterrupt)
Sets the RTC alarm time and enables the alarm interrupt.
- void [RTC_DRV_GetAlarm](#) (uint32_t instance, [rtc_datetime_t](#) *date)
Returns the RTC alarm time.
- void [RTC_DRV_InitRepeatAlarm](#) (uint32_t instance, [rtc_repeat_alarm_state_t](#) *repeatAlarmState)
Initializes the RTC repeat alarm state structure.
- bool [RTC_DRV_SetAlarmRepeat](#) (uint32_t instance, [rtc_datetime_t](#) *alarmTime, [rtc_datetime_t](#) *alarmRepInterval)
Sets an alarm that is periodically repeated.
- void [RTC_DRV_DeinitRepeatAlarm](#) (uint32_t instance)
Deinitializes the RTC repeat alarm state structure.

RTC Peripheral Driver

ISR Functions

- void [RTC_IRQHandler](#) (void)
Implements the RTC alarm handler named in the startup code.
- void [RTC_Seconds_IRQHandler](#) (void)
Implements the RTC seconds handler named in the startup code.

61.3.8 Data Structure Documentation

61.3.8.1 struct rtc_repeat_alarm_state_t

Data Fields

- [rtc_datetime_t alarmTime](#)
Sets the RTC alarm time.
- [rtc_datetime_t alarmRepTime](#)
Period for alarm to repeat, needs alarm interrupt be enabled.

61.3.8.1.0.12 Field Documentation

61.3.8.1.0.12.1 [rtc_datetime_t rtc_repeat_alarm_state_t::alarmTime](#)

61.3.8.1.0.12.2 [rtc_datetime_t rtc_repeat_alarm_state_t::alarmRepTime](#)

61.3.9 Function Documentation

61.3.9.1 [rtc_status_t RTC_DRV_Init \(uint32_t instance \)](#)

Enables the RTC clock and interrupts if requested by the user.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

Returns

kStatusRtcSuccess means success; Otherwise means failed.

61.3.9.2 void [RTC_DRV_Deinit \(uint32_t instance \)](#)

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

61.3.9.3 **bool RTC_DRV_IsCounterEnabled (uint32_t instance)**

The function checks the TCE bit in the RTC control register.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

Returns

- true: The RTC counter is enabled
- false: The RTC counter is disabled

61.3.9.4 **bool RTC_DRV_SetDatetime (uint32_t instance, rtc_datetime_t * datetime)**

The RTC counter is started after the time is set.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>datetime</i> | [in] pointer to structure where the date and time details to set are stored. |

Returns

- true: success in setting the time and starting the RTC
- false: failure. An error occurs because the datetime format is incorrect.

61.3.9.5 **void RTC_DRV_GetDatetime (uint32_t instance, rtc_datetime_t * datetime)**

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

RTC Peripheral Driver

| | |
|-----------------|--|
| <i>datetime</i> | [out] pointer to structure where the date and time details are stored. |
|-----------------|--|

61.3.9.6 void RTC_DRV_SetSecsIntCmd (uint32_t *instance*, bool *secondsEnable*)

Parameters

| | |
|----------------------|---|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>secondsEnable</i> | Takes true or false true: indicates seconds interrupt should be enabled false: indicates seconds interrupt should be disabled |

61.3.9.7 bool RTC_DRV_SetAlarm (uint32_t *instance*, rtc_datetime_t * *alarmTime*, bool *enableAlarmInterrupt*)

The function checks whether the specified alarm time is greater than the present time. If not, the function does not set the alarm and returns an error.

Parameters

| | |
|------------------------------|---|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>alarmTime</i> | [in] pointer to structure where the alarm time is stored. |
| <i>enableAlarm-Interrupt</i> | Takes true of false true: indicates alarm interrupt should be enabled false: indicates alarm interrupt should be disabled |

Returns

true: success in setting the RTC alarm

false: error in setting the RTC alarm. Error occurs because the alarm datetime format is incorrect.

61.3.9.8 void RTC_DRV_GetAlarm (uint32_t *instance*, rtc_datetime_t * *date*)

Parameters

| | |
|-----------------|--|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>date</i> | [out] pointer to structure where the alarm date and time details are stored. |

61.3.9.9 void RTC_DRV_InitRepeatAlarm (uint32_t *instance*, rtc_repeat_alarm_state_t * *repeatAlarmState*)

The RTC driver uses this user-provided structure to store the alarm state information.

Parameters

| | |
|-------------------------------|--|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>repeatAlarm- State</i> | Pointer to structure where the alarm state is stored |

61.3.9.10 bool RTC_DRV_SetAlarmRepeat (uint32_t *instance*, rtc_datetime_t * *alarmTime*, rtc_datetime_t * *alarmReplInterval*)

Parameters

| | |
|-------------------------------|--|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>alarmTime</i> | Pointer to structure where the alarm time is provided. |
| <i>alarmRep- Interval</i> | pointer to structure with the alarm repeat interval. |

Returns

true: success in setting the RTC alarm

false: error in setting the RTC alarm. Error occurs because the alarm datetime format is incorrect.

61.3.9.11 void RTC_DRV_DeinitRepeatAlarm (uint32_t *instance*)

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

RTC Peripheral Driver

61.3.9.12 void RTC_DRV_SetAlarmIntCmd (uint32_t instance, bool alarmEnable)

Parameters

| | |
|--------------------|---|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>alarmEnable</i> | Takes true or false true: indicates alarm interrupt should be enabled false: indicates alarm interrupt should be disabled |

61.3.9.13 bool RTC_DRV_GetAlarmIntCmd (uint32_t instance)

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

Returns

true: indicates alarm interrupt is enabled
false: indicates alarm interrupt is disabled

61.3.9.14 bool RTC_DRV_IsAlarmPending (uint32_t instance)

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

Returns

returns alarm status, for example, returns whether the alarm triggered
true: indicates alarm has occurred
false: indicates alarm has not occurred

61.3.9.15 void RTC_DRV_SetTimeCompensation (uint32_t instance, uint32_t compensationInterval, uint32_t compensationTime)

Parameters

| | |
|------------------------------|---|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>compensation-Interval</i> | User-specified compensation interval that is written to the CIR field in RTC Time Compensation Register (TCR) |
| <i>compensation-Time</i> | User-specified compensation time that is written to the TCR field in RTC Time Compensation Register (TCR) |

61.3.9.16 void RTC_DRV_GetTimeCompensation (uint32_t *instance*, uint32_t * *compensationInterval*, uint32_t * *compensationTime*)

Parameters

| | |
|------------------------------|--|
| <i>instance</i> | The RTC peripheral instance number. |
| <i>compensation-Interval</i> | User-specified pointer to store the compensation interval counter. This value is read from the CIC field in RTC Time Compensation Register (TCR) |
| <i>compensation-Time</i> | User-specified pointer to store the compensation time value. This value is read from the TCV field in RTC Time Compensation Register (TCR) |

61.3.9.17 void RTC_IRQHandler (void)

Handles the RTC alarm interrupt and invokes any callback related to the RTC alarm.

61.3.9.18 void RTC_Seconds_IRQHandler (void)

Handles the RTC seconds interrupt and invokes any callback related to the RTC second tick.

61.3.9.19 void RTC_DRV_AlarmIntAction (uint32_t *instance*)

To receive alarms periodically, the RTC_TAR register is updated using the repeat interval.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

RTC Peripheral Driver

61.3.9.20 void RTC_DRV_SecsIntAction (uint32_t *instance*)

Disables the time seconds interrupt (TSIE) bit.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | The RTC peripheral instance number. |
|-----------------|-------------------------------------|

61.3.10 Variable Documentation

61.3.10.1 RTC_Type* const g_rtcBase[RTC_INSTANCE_COUNT]

61.3.10.2 const IRQn_Type g_rtclrqId[RTC_INSTANCE_COUNT]

61.3.10.3 const IRQn_Type g_rtcSecondslrqId[RTC_INSTANCE_COUNT]

Chapter 62

Synchronous Audio Interface (SAI)

62.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Synchronous Audio Interface (SAI) block of Kinetis devices.

Modules

- [SAI HAL driver](#)
- [SAI Peripheral driver](#)

SAI HAL driver

62.2 SAI HAL driver

62.2.1 Overview

This section describes the programming interface of the SAI HAL driver.

Files

- file [fsl_sai_hal.h](#)

Data Structures

- struct [sai_clock_setting_t](#)
SAI clock configuration structure. [More...](#)

Enumerations

- enum [sai_protocol_t](#) {
[kSaiBusI2SLeft](#) = 0x0u,
[kSaiBusI2SRight](#) = 0x1u,
[kSaiBusI2SType](#) = 0x2u,
[kSaiBusPCMA](#) = 0x3u,
[kSaiBusPCMB](#) = 0x4u,
[kSaiBusAC97](#) = 0x5u }
Define the SAI bus type.
- enum [sai_master_slave_t](#) {
[kSaiMaster](#) = 0x0u,
[kSaiSlave](#) = 0x1u }
Master or slave mode.
- enum [sai_mono_stereo_t](#) {
[kSaiMono](#) = 0x0u,
[kSaiStereo](#) = 0x1u }
- enum [sai_sync_mode_t](#) {
[kSaiModeAsync](#) = 0x0u,
[kSaiModeSync](#) = 0x1u,
[kSaiModeSyncWithOtherTx](#) = 0x2u,
[kSaiModeSyncWithOtherRx](#) = 0x3u }
Synchronous or asynchronous mode.
- enum [sai_mclk_source_t](#) {
[kSaiMclkSourceSysclk](#) = 0x0u,
[kSaiMclkSourceSelect1](#) = 0x1u,
[kSaiMclkSourceSelect2](#) = 0x2u,
[kSaiMclkSourceSelect3](#) = 0x3u }
Master clock source.

- enum `sai_bclk_source_t` {
`kSaiBclkSourceBusclk` = 0x0u,
`kSaiBclkSourceMclkDiv` = 0x1u,
`kSaiBclkSourceOtherSai0` = 0x2u,
`kSaiBclkSourceOtherSai1` = 0x3u }
Bit clock source.
- enum `sai_interrupt_request_t` {
`kSaiIntrequestWordStart` = 0x1000u,
`kSaiIntrequestSyncError` = 0x800u,
`kSaiIntrequestFIFOWarning` = 0x200u,
`kSaiIntrequestFIFOError` = 0x400u,
`kSaiIntrequestFIFORequest` = 0x100u }
The SAI state flag.
- enum `sai_dma_request_t` {
`kSaiDmaReqFIFOWarning` = 0x2u,
`kSaiDmaReqFIFORequest` = 0x1u }
The DMA request sources.
- enum `sai_state_flag_t` {
`kSaiStateFlagWordStart` = 0x100000u,
`kSaiStateFlagSyncError` = 0x80000u,
`kSaiStateFlagFIFOError` = 0x40000u,
`kSaiStateFlagFIFORequest` = 0x10000u,
`kSaiStateFlagFIFOWarning` = 0x20000u,
`kSaiStateFlagSoftReset` = 0x1000000u,
`kSaiStateFlagAll` = 0x11F0000u }
The SAI state flag.
- enum `sai_reset_type_t` {
`kSaiResetTypeSoftware` = 0x1000000u,
`kSaiResetTypeFIFO` = 0x2000000u,
`kSaiResetAll` = 0x3000000u }
The reset type.
- enum `sai_run_mode_t` {
`kSaiRunModeDebug` = 0x0,
`kSaiRunModeStop` = 0x1 }

Module control

- void `SAI_HAL_TxInit` (I2S_Type *base)
Initializes the SAI transmit.
- void `SAI_HAL_RxInit` (I2S_Type *base)
Initializes the SAI receive.
- void `SAI_HAL_TxSetProtocol` (I2S_Type *base, `sai_protocol_t` protocol)
Sets transmit protocol relevant settings.
- void `SAI_HAL_RxSetProtocol` (I2S_Type *base, `sai_protocol_t` protocol)
Sets receive protocol relevant settings.
- void `SAI_HAL_TxSetMasterSlave` (I2S_Type *base, `sai_master_slave_t` master_slave_mode)

SAI HAL driver

- Sets master or slave mode.*
 • void [SAI_HAL_RxSetMasterSlave](#) (I2S_Type *base, [sai_master_slave_t](#) master_slave_mode)
Sets master or slave mode.

Overall Clock configuration

- void [SAI_HAL_TxClockSetup](#) (I2S_Type *base, [sai_clock_setting_t](#) *clk_config)
Sets up the clock for the SAI transmit.
- void [SAI_HAL_RxClockSetup](#) (I2S_Type *base, [sai_clock_setting_t](#) *clk_config)
Sets up the clock for the SAI receive.

Master clock configuration

- static void [SAI_HAL_SetMclkSrc](#) (I2S_Type *base, [sai_mclk_source_t](#) source)
Sets the master clock source.
- static uint32_t [SAI_HAL_GetMclkSrc](#) (I2S_Type *base)
Gets the master clock source.
- static void [SAI_HAL_SetMclkDividerCmd](#) (I2S_Type *base, bool enable)
Enables or disables the MCLK internal.

Bit clock configuration

- static void [SAI_HAL_TxSetBclkSrc](#) (I2S_Type *base, [sai_bclk_source_t](#) source)
Sets the bit clock source of transmit.
- static void [SAI_HAL_RxSetBclkSrc](#) (I2S_Type *base, [sai_bclk_source_t](#) source)
Sets bit clock source of the receive.
- static uint32_t [SAI_HAL_TxGetBclkSrc](#) (I2S_Type *base)
Gets the bit clock source of transmit.
- static uint32_t [SAI_HAL_RxGetBclkSrc](#) (I2S_Type *base)
Gets bit clock source of the receive.
- static void [SAI_HAL_TxSetBclkDiv](#) (I2S_Type *base, uint32_t divider)
Sets the transmit bit clock divider value.
- static void [SAI_HAL_RxSetBclkDiv](#) (I2S_Type *base, uint32_t divider)
Sets the receive bit clock divider value.
- static void [SAI_HAL_TxSetBclkInputCmd](#) (I2S_Type *base, bool enable)
Enables or disables the transmit bit clock input bit.
- static void [SAI_HAL_RxSetBclkInputCmd](#) (I2S_Type *base, bool enable)
Enables or disables the receive bit clock input bit.
- static void [SAI_HAL_TxSetSwapBclkCmd](#) (I2S_Type *base, bool enable)
Sets the transmit bit clock swap.
- static void [SAI_HAL_RxSetSwapBclkCmd](#) (I2S_Type *base, bool enable)
Sets the receive bit clock swap.

Mono or stereo configuration

- void [SAI_HAL_TxSetMonoStereo](#) (I2S_Type *base, [sai_mono_stereo_t](#) mono_stereo)

- Sets the transmit audio channel number.*
 • void [SAI_HAL_RxSetMonoStereo](#) (I2S_Type *base, [sai_mono_stereo_t](#) mono_stereo)
Sets the receive audio channel number.

Word configurations

- void [SAI_HAL_TxSetWordWidth](#) (I2S_Type *base, [sai_protocol_t](#) protocol, uint32_t bits)
Sets the transmit word width.
- void [SAI_HAL_RxSetWordWidth](#) (I2S_Type *base, [sai_protocol_t](#) protocol, uint32_t bits)
Sets the receive word width.

62.2.2 Data Structure Documentation

62.2.2.1 struct [sai_clock_setting_t](#)

Data Fields

- [sai_mclk_source_t](#) [mclk_src](#)
Master clock source.
- [sai_bclk_source_t](#) [bclk_src](#)
Bit clock source.
- uint32_t [mclk_src_freq](#)
Master clock source frequency.
- uint32_t [mclk](#)
Master clock frequency.
- uint32_t [bclk](#)
Bit clock frequency.

62.2.3 Enumeration Type Documentation

62.2.3.1 enum [sai_protocol_t](#)

Enumerator

kSaiBusI2SLeft Uses I2S left aligned format.

SAI HAL driver

kSaiBusI2SRight Uses I2S right aligned format.

kSaiBusI2SType Uses I2S format.

kSaiBusPCMA Uses I2S PCM A format.

kSaiBusPCMB Uses I2S PCM B format.

kSaiBusAC97 Uses I2S AC97 format.

62.2.3.2 enum sai_master_slave_t

Enumerator

kSaiMaster Master mode.

kSaiSlave Slave mode.

62.2.3.3 enum sai_mono_stereo_t

Enumerator

kSaiMono 1 Channel in frame.

kSaiStereo 2 Channels in frame.

62.2.3.4 enum sai_sync_mode_t

Enumerator

kSaiModeAsync Asynchronous mode.

kSaiModeSync Synchronous mode (with receiver or transmit)

kSaiModeSyncWithOtherTx Synchronous with another SAI transmit.

kSaiModeSyncWithOtherRx Synchronous with another SAI receiver.

62.2.3.5 enum sai_mclk_source_t

Enumerator

kSaiMclkSourceSysclk Master clock from the system clock.

kSaiMclkSourceSelect1 Master clock from source 1.

kSaiMclkSourceSelect2 Master clock from source 2.

kSaiMclkSourceSelect3 Master clock from source 3.

62.2.3.6 enum sai_bclk_source_t

Enumerator

- kSaiBclkSourceBusclk* Bit clock using bus clock.
- kSaiBclkSourceMclkDiv* Bit clock using master clock divider.
- kSaiBclkSourceOtherSai0* Bit clock from other SAI device.
- kSaiBclkSourceOtherSai1* Bit clock from other SAI device.

62.2.3.7 enum sai_interrupt_request_t

Enumerator

- kSaiIntrequestWordStart* Word start flag, means the first word in a frame detected.
- kSaiIntrequestSyncError* Sync error flag, means the sync error is detected.
- kSaiIntrequestFIFOWarning* FIFO warning flag, means the FIFO is empty.
- kSaiIntrequestFIFOError* FIFO error flag.
- kSaiIntrequestFIFORequest* FIFO request, means reached watermark.

62.2.3.8 enum sai_dma_request_t

Enumerator

- kSaiDmaReqFIFOWarning* FIFO warning caused by the DMA request.
- kSaiDmaReqFIFORequest* FIFO request caused by the DMA request.

62.2.3.9 enum sai_state_flag_t

Enumerator

- kSaiStateFlagWordStart* Word start flag, means the first word in a frame detected.
- kSaiStateFlagSyncError* Sync error flag, means the sync error is detected.
- kSaiStateFlagFIFOError* FIFO error flag.
- kSaiStateFlagFIFORequest* FIFO request flag.
- kSaiStateFlagFIFOWarning* FIFO warning flag.
- kSaiStateFlagSoftReset* Software reset flag.
- kSaiStateFlagAll* All flags.

62.2.3.10 enum sai_reset_type_t

Enumerator

- kSaiResetTypeSoftware* Software reset, reset the logic state.

SAI HAL driver

kSaiResetTypeFIFO FIFO reset, reset the FIFO read and write pointer.

kSaiResetAll All reset.

62.2.3.11 enum sai_run_mode_t

Enumerator

kSaiRunModeDebug In debug mode.

kSaiRunModeStop In stop mode.

62.2.4 Function Documentation

62.2.4.1 void SAI_HAL_TxInit (I2S_Type * *base*)

The initialization resets the SAI module by setting the SR bit of TCSR register. Note that the function writes 0 to every control registers.

Parameters

| | |
|-------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
|-------------|--------------------------------------|

62.2.4.2 void SAI_HAL_RxInit (I2S_Type * *base*)

The initialization resets the SAI module by setting the SR bit of RCSR register. Note that the function writes 0 to every control registers.

Parameters

| | |
|-------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
|-------------|--------------------------------------|

62.2.4.3 void SAI_HAL_TxSetProtocol (I2S_Type * *base*, sai_protocol_t *protocol*)

The bus mode indicates which protocol SAI uses. It can be I2S left, right, and so on. Each protocol has a different configuration on bit clock and frame sync.

Parameters

| | |
|-----------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>protocol</i> | The protocol selection. It can be I2S left aligned, I2S right aligned, and so on. |

62.2.4.4 void SAI_HAL_RxSetProtocol (I2S_Type * *base*, sai_protocol_t *protocol*)

The bus mode indicates which protocol SAI uses. It can be I2S left, right, and so on. Each protocol has a different configuration on bit clock and frame sync.

Parameters

| | |
|-----------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>protocol</i> | The protocol selection. It can be I2S left aligned, I2S right aligned, and so on. |

62.2.4.5 void SAI_HAL_TxSetMasterSlave (I2S_Type * *base*, sai_master_slave_t *master_slave_mode*)

The function determines master or slave mode. Master mode provides its own clock and slave mode uses an external clock.

Parameters

| | |
|--------------------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>master_slave_mode</i> | Master or slave mode. |

62.2.4.6 void SAI_HAL_RxSetMasterSlave (I2S_Type * *base*, sai_master_slave_t *master_slave_mode*)

The function determines master or slave mode. Master mode provides its own clock and slave mode uses external clock.

Parameters

| | |
|--------------------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>master_slave_mode</i> | Master or slave mode. |

SAI HAL driver

62.2.4.7 void SAI_HAL_TxClockSetup (I2S_Type * *base*, sai_clock_setting_t * *clk_config*)

This function can sets the clock settings according to the configuration structure. In this configuration setting structure, users can set clock source, clock source frequency, and frequency of the master clock and bit clock. If the bit clock source is the master clock, the master clock frequency should equal to the bit clock source frequency. If the bit clock source is not the master clock, then settings of the master clock have no effect on the setting.

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>clk_config</i> | Pointer to SAI clock configuration structure. |

62.2.4.8 void SAI_HAL_RxClockSetup (I2S_Type * *base*, sai_clock_setting_t * *clk_config*)

This function sets the clock settings according to the configuration structure. In this configuration setting structure, users can set clock source, clock source frequency, and frequency of the master clock and bit clock. If the bit clock source is the master clock, the master clock frequency should equal to the bit clock source frequency. If the bit clock source is not the master clock, then settings of the master clock have no effect on the setting.

Parameters

| | |
|-------------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>clk_config</i> | Pointer to SAI clock configuration structure. |

**62.2.4.9 static void SAI_HAL_SetMclkSrc (I2S_Type * *base*, sai_mclk_source_t *source*)
[inline], [static]**

The source of the clock is different in each SoC. This function sets the clock source for the SAI master clock source. The master clock produces the bit clock for the data transfer.

Parameters

| | |
|---------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>source</i> | Mater clock source |

62.2.4.10 static uint32_t SAI_HAL_GetMclkSrc (I2S_Type * *base*) [inline], [static]

The source of the clock is different in each SoCs. This function gets the clock source for the SAI master clock source. The master clock produces the bit clock for the data transfer.

Parameters

| | |
|-------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
|-------------|--------------------------------------|

Returns

Mater clock source

62.2.4.11 static void SAI_HAL_SetMclkDividerCmd (I2S_Type * *base*, bool *enable*) [inline], [static]

This function enables or disables the internal MCLK.

Parameters

| | |
|---------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>enable</i> | True means enable, false means disable. |

62.2.4.12 static void SAI_HAL_TxSetBclkSrc (I2S_Type * *base*, sai_bclk_source_t *source*) [inline], [static]

It is generated by the master clock, bus clock, and other devices.

The function sets the source of the bit clock. The bit clock can be produced by the master clock and from the bus clock or other SAI transmit/receive. Transmit and receive in the SAI module use the same bit clock either from transmit or receive.

Parameters

SAI HAL driver

| | |
|---------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>source</i> | Bit clock source. |

62.2.4.13 `static void SAI_HAL_RxSetBclkSrc (I2S_Type * base, sai_bclk_source_t source) [inline], [static]`

It is generated by the master clock, bus clock, and other devices.

The function sets the source of the bit clock. The bit clock can be produced by the master clock, and from the bus clock or other SAI transmit/receive. Transmit and receive in the SAI module use the same bit clock either from transmit or receive.

Parameters

| | |
|---------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>source</i> | Bit clock source. |

62.2.4.14 `static uint32_t SAI_HAL_TxGetBclkSrc (I2S_Type * base) [inline], [static]`

It is generated by the master clock, bus clock, and other devices.

The function gets the source of the bit clock. The bit clock can be produced by the master clock and from the bus clock or other SAI transmit/receive. Transmit and receive in the SAI module use the same bit clock either from transmit or receive.

Parameters

| | |
|-------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
|-------------|--------------------------------------|

Returns

Bit clock source.

62.2.4.15 `static uint32_t SAI_HAL_RxGetBclkSrc (I2S_Type * base) [inline], [static]`

It is generated by the master clock, bus clock and other devices.

The function gets the source of the bit clock. The bit clock can be produced by the master clock, and from the bus clock or other SAI transmit/receive. Transmit and receive in the SAI module use the same bit clock either from transmit or receive.

Parameters

| | |
|-------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
|-------------|--------------------------------------|

Returns

Bit clock source.

**62.2.4.16 static void SAI_HAL_TxSetBclkDiv (I2S_Type * *base*, uint32_t *divider*)
 [inline], [static]**

$bclk = mclk / divider$. At the same time, $bclk = sample_rate * channel * bits$. This means how much time is needed to transfer one bit. Note that the function is called while the bit clock source is the master clock.

Parameters

| | |
|----------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>divider</i> | The divide number of bit clock. |

**62.2.4.17 static void SAI_HAL_RxSetBclkDiv (I2S_Type * *base*, uint32_t *divider*)
 [inline], [static]**

$bclk = mclk / divider$. At the same time, $bclk = sample_rate * channel * bits$. This means how much time is needed to transfer one bit. Note that the function is called while the bit clock source is the master clock.

Parameters

| | |
|----------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>divider</i> | The divide number of bit clock. |

**62.2.4.18 static void SAI_HAL_TxSetBclkInputCmd (I2S_Type * *base*, bool *enable*)
 [inline], [static]**

Parameters

| | |
|-------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
|-------------|--------------------------------------|

SAI HAL driver

| | |
|---------------|---|
| <i>enable</i> | True means enable, false means disable. |
|---------------|---|

62.2.4.19 `static void SAI_HAL_RxSetBclInputCmd (I2S_Type * base, bool enable)`
`[inline], [static]`

Parameters

| | |
|---------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>enable</i> | True means enable, false means disable. |

62.2.4.20 `static void SAI_HAL_TxSetSwapBclCmd (I2S_Type * base, bool enable)`
`[inline], [static]`

This field swaps the bit clock used by the transmitter. When the transmitter is configured in asynchronous mode and this bit is set, the transmitter is clocked by the receiver bit clock. This allows the transmitter and receiver to share the same bit clock, but the transmitter continues to use the transmit frame sync (SAI_TX_SYNC). When the transmitter is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the transmitter bit clock (SAI_TX_BCLK) but use the receiver frame sync (SAI_RX_SYNC).

Parameters

| | |
|---------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>enable</i> | True means swap bit clock; false means no swap. |

62.2.4.21 `static void SAI_HAL_RxSetSwapBclCmd (I2S_Type * base, bool enable)`
`[inline], [static]`

This field swaps the bit clock used by the receiver. When the receiver is configured in asynchronous mode and this bit is set, the receiver is clocked by the transmitter bit clock (SAI_TX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the receiver continues to use the receiver frame sync (SAI_RX_SYNC). When the receiver is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the receiver bit clock (SAI_RX_BCLK) but use the transmitter frame sync (SAI_TX_SYNC).

Parameters

| | |
|---------------|---|
| <i>base</i> | Register base address of SAI module. |
| <i>enable</i> | True means swap bit clock; false means no swap. |

62.2.4.22 void SAI_HAL_TxSetMonoStereo (I2S_Type * *base*, sai_mono_stereo_t *mono_stereo*)

The channel can be mono or stereo.

Parameters

| | |
|--------------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>mono_stereo</i> | Mono or stereo mode. |

62.2.4.23 void SAI_HAL_RxSetMonoStereo (I2S_Type * *base*, sai_mono_stereo_t *mono_stereo*)

The channel can be mono or stereo.

Parameters

| | |
|--------------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>mono_stereo</i> | Mono or stereo mode. |

62.2.4.24 void SAI_HAL_TxSetWordWidth (I2S_Type * *base*, sai_protocol_t *protocol*, uint32_t *bits*)

This interface is for I2S and PCM series protocol. It sets the width of the first word and any other word in the same manner. At the same time, for I2S series protocol, it sets the frame sync width equal to the word width.

Parameters

| | |
|-----------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>protocol</i> | Protocol used for transmit now. |

SAI HAL driver

| | |
|-------------|----------------------|
| <i>bits</i> | transmit word width. |
|-------------|----------------------|

62.2.4.25 void SAI_HAL_RxSetWordWidth (I2S_Type * *base*, sai_protocol_t *protocol*, uint32_t *bits*)

This interface is for I2S and PCM series protocol. It sets the width of the first word and any other word in the same manner. At the same time, for I2S series protocol, it sets the frame sync width equal to the word width.

Parameters

| | |
|-----------------|--------------------------------------|
| <i>base</i> | Register base address of SAI module. |
| <i>protocol</i> | Protocol used for receive now. |
| <i>bits</i> | receive word width. |

62.3 SAI Peripheral driver

62.3.1 Overview

This chapter describes the programming interface of the SAI Peripheral driver. The SAI driver initializes, configures, starts, and stops the SAI. The SAI driver also implements configuration functions, sends, and receives data.

62.3.2 SAI Initialization

To initialize SAI, call the [SAI_DRV_TxInit\(\)](#) or [SAI_DRV_RxInit\(\)](#) functions and pass the SAI instance and SAI configuration structure parameters. The function opens the clock gate and initializes the SAI modules according to the structure information.

62.3.3 SAI Configuration

Configuration is implemented by the [SAI_DRV_TxConfigDataFormat\(\)](#) function. To use this function, transfer the audio data format to the SAI module.

62.3.4 SAI Call diagram

To use the SAI driver, follow these steps and use transmit as an example:

1. Initialize the SAI module by calling the [SAI_DRV_TxInit\(\)](#) function.
2. Configure the audio data features of SAI by calling the [SAI_DRV_TxConfigDataFormat\(\)](#) function.
3. Send/receive data by calling the [SAI_DRV_SendDataInt\(\)](#) or the [SAI_DRV_SendDataDma\(\)](#) functions.
4. Stop transmit or receive by calling the [SAI_DRV_TxStopModule\(\)](#) or the [SAI_DRV_RxStopModule\(\)](#) function.
5. Shut down the SAI module by calling the [SAI_DRV_TxDeinit\(\)](#) function.

This is example code to initialize and configure the SAI driver in DMA mode:

```
//Initialize configuration structure.
sai_user_config_t tx_config;
tx_config.bus_type = kSaiBusI2SLeft;
tx_config.channel = 0;
tx_config.slave_master = kSaiMaster;
tx_config.sync_mode = kSaiModeAsync;
tx_config.bclk_source = kSaiBclkSourceMclkDiv;
tx_config.mclk_source = kSaiMclkSourceSysclk;
tx_config.watermark = 4;
tx_config.dma_source = kDmaRequestMux0I2S0Tx;

//SAI state, used for driver internal logic.
sai_state_t tx_state;

//Data format of audio data
```

SAI Peripheral driver

```

audio_data_format_t format;
format.bits = 16;
format.sample_rate = 44100;
format.mclk = 384 * format->sample_rate;
format.mono_stereo = kSaiStereo;
//Initialize SAI transmit.
SAI_DRV_TxInit(instance, &tx_config, &tx_state);
//Configure the data format of SAI transmit.
SAI_DRV_TxConfigDataFormat(instance, &format);

//option: register callback functions for finished transfer
SAI_DRV_TxRegisterCallback(instance, callback, callback_param);
//start send data
SAI_DRV_SendDataDma(instance, addr, len);

.....

//Stop transmit.
SAI_DRV_TxStopModule(instance);
//De-initialize transmit.
SAI_DRV_TxDeinit(instance);

```

When using DMA to transfer data, ensure that data is consistent because of cache for memory. In other words, when reading data from memory, the application should ensure that data from or to the memory device is not cached.

Files

- file [fsl_sai_driver.h](#)

Data Structures

- struct [sai_data_format_t](#)
Defines the PCM data format. [More...](#)
- struct [sai_state_t](#)
SAI internal state Users should allocate and transfer memory to the PD during the initialization function. [More...](#)
- struct [sai_user_config_t](#)
The description structure for the SAI transmit/receive module. [More...](#)

Typedefs

- typedef void(* [sai_callback_t](#))(void *parameter)
SAI callback function.

Enumerations

- enum [sai_status_t](#)
Status structure for SAI.

Functions

- [sai_status_t SAI_DRV_TxInit](#) (uint32_t instance, [sai_user_config_t](#) *config, [sai_state_t](#) *state)
Initializes the SAI module.
- [sai_status_t SAI_DRV_RxInit](#) (uint32_t instance, [sai_user_config_t](#) *config, [sai_state_t](#) *state)
Initializes the SAI receive module.
- void [SAI_DRV_TxGetDefaultSetting](#) ([sai_user_config_t](#) *config)
Gets the default setting of the user configuration.
- void [SAI_DRV_RxGetDefaultSetting](#) ([sai_user_config_t](#) *config)
Gets the default settings of the user configuration.
- [sai_status_t SAI_DRV_TxDeinit](#) (uint32_t instance)
De-initializes the SAI transmit module.
- [sai_status_t SAI_DRV_RxDeinit](#) (uint32_t instance)
Deinitializes the SAI receive module.
- [sai_status_t SAI_DRV_TxConfigDataFormat](#) (uint32_t instance, [sai_data_format_t](#) *format)
Configures the audio data format of the transmit.
- [sai_status_t SAI_DRV_RxConfigDataFormat](#) (uint32_t instance, [sai_data_format_t](#) *format)
Configures the audio data format of the receive.
- void [SAI_DRV_TxStartModule](#) (uint32_t instance)
Starts the transmit transfer.
- void [SAI_DRV_RxStartModule](#) (uint32_t instance)
Starts the receive process.
- void [SAI_DRV_TxStopModule](#) (uint32_t instance)
Stops writing data to FIFO to disable the DMA or the interrupt request bit.
- void [SAI_DRV_RxStopModule](#) (uint32_t instance)
Stops receiving data from FIFO to disable the DMA or the interrupt request bit.
- void [SAI_DRV_TxSetIntCmd](#) (uint32_t instance, bool enable)
Enables or disables the transmit interrupt source.
- void [SAI_DRV_RxSetIntCmd](#) (uint32_t instance, bool enable)
Enables or disables the receive interrupt source.
- void [SAI_DRV_TxSetDmaCmd](#) (uint32_t instance, bool enable)
Enables or disables the transmit DMA source.
- void [SAI_DRV_RxSetDmaCmd](#) (uint32_t instance, bool enable)
Enables or disables the receive interrupt source.
- static uint32_t [SAI_DRV_TxGetFifoAddr](#) (uint32_t instance, uint32_t fifo_channel)
Gets the transmit FIFO address of the data channel.
- static uint32_t [SAI_DRV_RxGetFifoAddr](#) (uint32_t instance, uint32_t fifo_channel)
Gets the receive FIFO address of the data channel.
- uint32_t [SAI_DRV_SendDataInt](#) (uint32_t instance, uint8_t *addr, uint32_t len)
Sends data using interrupts.
- uint32_t [SAI_DRV_ReceiveDataInt](#) (uint32_t instance, uint8_t *addr, uint32_t len)
Receives data a certain length using interrupt way.
- uint32_t [SAI_DRV_SendDataDma](#) (uint32_t instance, uint8_t *addr, uint32_t len)
Sends data of a certain length using the DMA method.
- uint32_t [SAI_DRV_ReceiveDataDma](#) (uint32_t instance, uint8_t *addr, uint32_t len)
Receives data using the DMA.
- void [SAI_DRV_TxRegisterCallback](#) (uint32_t instance, [sai_callback_t](#) callback, void *callback_param)
Registers the callback function after completing a send.
- void [SAI_DRV_RxRegisterCallback](#) (uint32_t instance, [sai_callback_t](#) callback, void *callback_param)

SAI Peripheral driver

- *Registers the callback function after completing a receive.*
- void [SAI_DRV_TxIRQHandler](#) (uint32_t instance)
Default SAI transmit interrupt handler.
- void [SAI_DRV_RxIRQHandler](#) (uint32_t instance)
Default SAI receive interrupt handler.

62.3.5 Data Structure Documentation

62.3.5.1 struct sai_data_format_t

Data Fields

- uint32_t [sample_rate](#)
Sample rate of the PCM file.
- uint32_t [mclk](#)
Master clock frequency.
- uint8_t [bits](#)
Number of bits in a word.
- [sai_mono_stereo_t](#) [mono_stereo](#)
Number of words in a frame.

62.3.5.2 struct sai_state_t

Note: During the SAI execution, users should not free the state. Otherwise, the driver malfunctions.

62.3.5.3 struct sai_user_config_t

Data Fields

- [sai_mclk_source_t](#) [mclk_source](#)
Master clock source.
- uint8_t [channel](#)
Which FIFO is used to transfer.
- [sai_sync_mode_t](#) [sync_mode](#)
Synchronous or asynchronous.
- [sai_protocol_t](#) [protocol](#)
I2S left, I2S right, or I2S type.
- [sai_master_slave_t](#) [slave_master](#)
Master or slave.
- [sai_bclk_source_t](#) [bclk_source](#)
Bit clock from master clock or other modules.
- uint32_t [dma_source](#)
The DMA request source.

62.3.6 Function Documentation

62.3.6.1 `sai_status_t SAI_DRV_TxInit (uint32_t instance, sai_user_config_t * config, sai_state_t * state)`

This function initializes the SAI registers according to the configuration structure. This function also initializes the basic SAI settings including board-relevant settings. Notice: This function does not initialize an entire SAI instance. It only initializes the transmit according to the value in the handler.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | SAI module instance. |
| <i>config</i> | The configuration structure of SAI. |
| <i>state</i> | Pointer of SAI run state structure. |

Returns

Return `kStatus_SAI_Success` while the initialize success and `kStatus_SAI_Fail` if failed.

62.3.6.2 `sai_status_t SAI_DRV_RxInit (uint32_t instance, sai_user_config_t * config, sai_state_t * state)`

This function initializes the SAI registers according to the configuration structure. This function also initializes the basic SAI settings including board-relevant settings. Note that this function does not initialize an entire SAI instance. This function only initializes the transmit according to the value in the handler.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>instance</i> | SAI module instance. |
| <i>config</i> | The configuration structure of SAI. |
| <i>state</i> | Pointer of SAI run state structure. |

Returns

Return `kStatus_SAI_Success` while the initialize success and `kStatus_SAI_Fail` if failed.

62.3.6.3 `void SAI_DRV_TxGetDefaultSetting (sai_user_config_t * config)`

The default settings for SAI are:

- Audio protocol is I2S format
- Watermark is 4

SAI Peripheral driver

- Use SAI0
- Channel is channel0
- SAI as master
- MCLK from system core clock
- Transmit is in an asynchronous mode

Parameters

| | |
|---------------|--------------------------------------|
| <i>config</i> | Pointer of user configure structure. |
|---------------|--------------------------------------|

62.3.6.4 void SAI_DRV_RxGetDefaultSetting (sai_user_config_t * config)

The default settings for SAI are: Audio protocol is I2S format Watermark is 4 Use SAI0 Data channel is channel0 SAI as master MCLK from system core clock Receive is in synchronous way

Parameters

| | |
|---------------|--------------------------------------|
| <i>config</i> | Pointer of user configure structure. |
|---------------|--------------------------------------|

62.3.6.5 sai_status_t SAI_DRV_TxDeinit (uint32_t instance)

This function closes the SAI transmit device, but does not close the entire SAI instance. It only closes the clock gate while both transmit and receive are closed in the same instance.

Parameters

| | |
|-----------------|----------------------|
| <i>instance</i> | SAI module instance. |
|-----------------|----------------------|

Returns

Return kStatus_SAI_Success while the process success and kStatus_SAI_Fail if failed.

62.3.6.6 sai_status_t SAI_DRV_RxDeinit (uint32_t instance)

This function closes the SAI receive device, but does not close the entire SAI instance. It only closes the clock gate while both transmit and receive are closed in the same instance.

Parameters

| | |
|-----------------|----------------------|
| <i>instance</i> | SAI module instance. |
|-----------------|----------------------|

Returns

Return `kStatus_SAI_Success` while the process success and `kStatus_SAI_Fail` if failed.

62.3.6.7 `sai_status_t SAI_DRV_TxConfigDataFormat (uint32_t instance, sai_data_format_t * format)`

The function configures an audio sample rate, data bits, and a channel number.

Parameters

| | |
|-----------------|------------------------------------|
| <i>instance</i> | SAI module instance. |
| <i>format</i> | PCM data format structure pointer. |

Returns

Return `kStatus_SAI_Success` while the process success and `kStatus_SAI_Fail` if failed.

62.3.6.8 `sai_status_t SAI_DRV_RxConfigDataFormat (uint32_t instance, sai_data_format_t * format)`

The function configures an audio sample rate, data bits, and a channel number.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | SAI module instance of the SAI module. |
| <i>format</i> | PCM data format structure pointer. |

Returns

Return `kStatus_SAI_Success` while the process success and `kStatus_SAI_Fail` if failed.

62.3.6.9 `void SAI_DRV_TxStartModule (uint32_t instance)`

The function enables the interrupt/DMA request source and the transmit channel.

SAI Peripheral driver

Parameters

| | |
|-----------------|----------------------|
| <i>instance</i> | SAI module instance. |
|-----------------|----------------------|

62.3.6.10 void SAI_DRV_RxStartModule (uint32_t *instance*)

The function enables the interrupt/DMA request source and the transmit channel.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | SAI module instance of the SAI module. |
|-----------------|--|

62.3.6.11 void SAI_DRV_TxStopModule (uint32_t *instance*)

This function provides the method to pause writing data.

Parameters

| | |
|-----------------|----------------------|
| <i>instance</i> | SAI module instance. |
|-----------------|----------------------|

62.3.6.12 void SAI_DRV_RxStopModule (uint32_t *instance*)

This function provides the method to pause writing data.

Parameters

| | |
|-----------------|----------------------|
| <i>instance</i> | SAI module instance. |
|-----------------|----------------------|

62.3.6.13 void SAI_DRV_TxSetIntCmd (uint32_t *instance*, bool *enable*)

Parameters

| | |
|-----------------|---|
| <i>instance</i> | SAI module instance. |
| <i>enable</i> | True means enable interrupt source, false means disable interrupt source. |

62.3.6.14 void SAI_DRV_RxSetIntCmd (uint32_t *instance*, bool *enable*)

Parameters

| | |
|-----------------|---|
| <i>instance</i> | SAI module instance. |
| <i>enable</i> | True means enable interrupt source, false means disable interrupt source. |

62.3.6.15 void SAI_DRV_TxSetDmaCmd (uint32_t *instance*, bool *enable*)

Parameters

| | |
|-----------------|---|
| <i>instance</i> | SAI module instance. |
| <i>enable</i> | True means enable DMA source, false means disable DMA source. |

62.3.6.16 void SAI_DRV_RxSetDmaCmd (uint32_t *instance*, bool *enable*)

Parameters

| | |
|-----------------|---|
| <i>instance</i> | SAI module instance. |
| <i>enable</i> | True means enable DMA source, false means disable DMA source. |

62.3.6.17 static uint32_t SAI_DRV_TxGetFifoAddr (uint32_t *instance*, uint32_t *fifo_channel*) [inline], [static]

This function is mainly used for the DMA settings which the DMA configuration needs for the SAI source/destination address.

Parameters

| | |
|---------------------|--|
| <i>instance</i> | SAI module instance of the SAI module. |
| <i>fifo_channel</i> | FIFO channel of SAI transmit. |

Returns

Returns the address of the data channel FIFO.

62.3.6.18 static uint32_t SAI_DRV_RxGetFifoAddr (uint32_t *instance*, uint32_t *fifo_channel*) [inline], [static]

This function is mainly used for the DMA settings which the DMA configuration needs for the SAI source/destination address.

SAI Peripheral driver

Parameters

| | |
|---------------------|--|
| <i>instance</i> | SAI module instance of the SAI module. |
| <i>fifo_channel</i> | FIFO channel of SAI receive. |

Returns

Returns the address of the data channel FIFO.

62.3.6.19 `uint32_t SAI_DRV_SendDataInt (uint32_t instance, uint8_t * addr, uint32_t len)`

This function sends data to the transmit FIFO. This function starts the transfer, and, while finishing the transfer, calls the callback function registered by users. This function is an un-blocking function.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | SAI module instance of the SAI module. |
| <i>addr</i> | Address of the data which needs to be transferred. |
| <i>len</i> | The number of bytes which need to be sent. |

Returns

Returns the length which was sent.

62.3.6.20 `uint32_t SAI_DRV_ReceiveDataInt (uint32_t instance, uint8_t * addr, uint32_t len)`

This function receives the data from the receive FIFO. This function starts the transfer, and, while finishing the transfer, calls the callback function registered by the user. This function is an un-blocking function.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | SAI module instance. |
| <i>addr</i> | Address of the data which needs to be transferred. |

| | |
|------------|---------------------------------|
| <i>len</i> | The number of bytes to receive. |
|------------|---------------------------------|

Returns

Returns the length received.

62.3.6.21 uint32_t SAI_DRV_SendDataDma (uint32_t *instance*, uint8_t * *addr*, uint32_t *len*)

This function sends the data to the transmit FIFO. It starts the transfer, and, while finishing the transfer, calls the callback function registered by users. This function is an a-sync function.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | SAI module instance of the SAI module. |
| <i>addr</i> | Address of the data which needs to be transferred. |
| <i>len</i> | The number of bytes which need to be sent. |

Returns

Returns the length which was sent.

62.3.6.22 uint32_t SAI_DRV_ReceiveDataDma (uint32_t *instance*, uint8_t * *addr*, uint32_t *len*)

This function receives the data from the receive FIFO. It starts the transfer, and, while finishing the transfer, calls the callback function registered by the user. This function is an a-sync function.

Parameters

| | |
|-----------------|--|
| <i>instance</i> | SAI module instance. |
| <i>addr</i> | Address of the data which needs to be transferred. |
| <i>len</i> | The number of bytes to receive. |

Returns

Returns the length received.

62.3.6.23 void SAI_DRV_TxRegisterCallback (uint32_t *instance*, sai_callback_t *callback*, void * *callback_param*)

This function tells the SAI which function needs to be called after a period length sending. This callback function is used for non-blocking sending.

SAI Peripheral driver

Parameters

| | |
|----------------------------------|---|
| <i>instance</i> | SAI module instance. |
| <i>callback</i> | Callback function defined by users. |
| <i>callback_</i> <i>param</i> | The parameter of the callback function. |

62.3.6.24 void SAI_DRV_RxRegisterCallback (uint32_t *instance*, sai_callback_t *callback*, void * *callback_param*)

This function tells the SAI which function needs to be called after a period length receive. This callback function is used for non-blocking receiving.

Parameters

| | |
|----------------------------------|---|
| <i>instance</i> | SAI module instance. |
| <i>callback</i> | Callback function defined by users. |
| <i>callback_</i> <i>param</i> | The parameter of the callback function. |

62.3.6.25 void SAI_DRV_TxIRQHandler (uint32_t *instance*)

This function sends data in the interrupt and checks the FIFO error.

Parameters

| | |
|-----------------|----------------------|
| <i>instance</i> | SAI module instance. |
|-----------------|----------------------|

62.3.6.26 void SAI_DRV_RxIRQHandler (uint32_t *instance*)

This function receives data in the interrupt and checks the FIFO error.

Parameters

| | |
|-----------------|----------------------|
| <i>instance</i> | SAI module instance. |
|-----------------|----------------------|

Chapter 63 System Clock Generator (SCG)

63.1 Overview

The Kinetis SDK provides a HAL driver for the System Clock Generator (SCG) block of Kinetis devices.

Modules

- [SCG HAL driver](#)

SCG HAL driver

63.2 SCG HAL driver

This chapter describes the programming interface of the SCG HAL driver. The SCG HAL driver configures the SCG (System Clock Generator). It handles calibration, initialization, and configuration of the SCG module.

The SCG driver provides three kinds of APIs:

1. APIs for MCU system clock.
2. APIs for clock out selection.
3. APIs for clock source configuration, including system OSC, slow IRC, fast IRC, and system PLL.

63.2.1 APIs for MCU system clock

The MCU system clock configuration includes clock source and dividers. There are dedicated control registers for RUN mode, VLPR mode, and HSRUN mode. When the MCU switches to a new power mode, the configuration for the corresponding mode is used.

The SCG driver provides APIs to set and get configuration registers. For example, to get the system clock configuration of the RUN mode, use the function `CLOCK_HAL_GetSystemClockConfigInRun()`. To set the system clock configuration of the VLPR mode, use the function `CLOCK_HAL_SetSystemClockConfigInVlpr()`.

Besides these APIs, the SCG HAL driver also provides the `CLOCK_HAL_GetSystemClockFreq()` function to get the system clock output frequency.

63.2.2 APIs for clock out selection

For the SCG CLKOUT, the SCG HAL driver provides the `CLOCK_HAL_GetClkOutSel()` and `CLOCK_HAL_SetClkOutSel()` functions to get and set the configuration.

63.2.3 APIs for clock source configuration

The SCG has four clock sources, system OSC, system PLL, fast IRC, and slow IRC. For each clock source, the SCG driver provides these APIs:

- API to set up the clock source one step base on configuration structure.
- API to get the default configuration structure. This configuration structure ensures that the clock works. For special use cases, modify the structure.
- API to validate the configuration structure (optional).
- API to get the frequency of this clock source.
- API to get the asynchronous frequency of this clock source.
- API to de-initialize the clock source.

This is an example to set up the clock source based on the SCG HAL APIs.

```
/* An example code that shows how to set up the system OSC.

scg_sys_osc_config_t config;

// Get default configuration.
CLOCK_HAL_GetSysOscDefaultConfig(&config);

// Modify according to board setting.
// ...

// Sets up the system OSC.
CLOCK_HAL_InitSysOsc(SCG_BASE, &config);

// De-initializes the system OSC.
CLOCK_HAL_DeinitSysOsc(SCG_BASE);
```

Because some configurations of the clock source can only be changed when the clock source is disabled, the function `CLOCK_HAL_InitXxx` disables the clock source, re-configures and enables it. As a result, before using the `CLOCK_HAL_InitXxx`, ensure that the clock source is not used.

- Not chosen as the system clock.
- Not used to generate asynchronous clock for on-chip peripherals.
- Not used by another clock source. For example, the FIRC can be used as the clock source of the system PLL. Therefore, when the system PLL is used, do not use the `CLOCK_HAL_InitFirc` function to re-configure FIRC.

Chapter 64

Secured Digital Host Controller (SDHC)

64.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Secure Digital Host Controller (SDHC) block of Kinetis devices.

Modules

- [SD Card SPI Data Definition](#)
- [SD Card SPI Driver](#)
- [SDHC Card Definition](#)
- [SDHC Card Driver](#)
- [SDHC Card Related Standard Definition](#)
- [SDHC Data Types](#)
- [SDHC HAL](#)
- [SDHC Peripheral Driver](#)
- [SDHC Standard Definition](#)

SDHC Card Definition

64.2 SDHC Card Definition

This chapter describes the programming interface of the card data definition for FSL SD host controller.

64.3 SDHC Card Driver

This chapter describes the programming interface of the card driver for FSL SD host controller.

SDHC Card Related Standard Definition

64.4 SDHC Card Related Standard Definition

This chapter describes the card standard definition.

64.5 SDHC Data Types

64.5.1 Overview

This section describes the SDHC Data Types.

Data Structures

- struct [sdhc_user_config_t](#)
SDHC Initialization Configuration Structure. [More...](#)
- struct [sdhc_host_t](#)
SDHC Host Device Structure. [More...](#)
- struct [sdhc_data_t](#)
SDHC Data Structure. [More...](#)
- struct [sdhc_request_t](#)
SDHC Request Structure. [More...](#)

SDHC Data Types

Enumerations

- enum `sdhc_status_t` {
 - `kStatus_SDHC_NoError = 0,`
 - `kStatus_SDHC_InitFailed,`
 - `kStatus_SDHC_SetClockFailed,`
 - `kStatus_SDHC_SetCardToIdle,`
 - `kStatus_SDHC_SetCardBlockSizeFailed,`
 - `kStatus_SDHC_SendAppOpCondFailed,`
 - `kStatus_SDHC_AllSendCidFailed,`
 - `kStatus_SDHC_SendRcaFailed,`
 - `kStatus_SDHC_SendCsdFailed,`
 - `kStatus_SDHC_SendScrFailed,`
 - `kStatus_SDHC_SelectCardFailed,`
 - `kStatus_SDHC_SwitchHighSpeedFailed,`
 - `kStatus_SDHC_SetCardWideBusFailed,`
 - `kStatus_SDHC_SetBusWidthFailed,`
 - `kStatus_SDHC_SendCardStatusFailed,`
 - `kStatus_SDHC_StopTransmissionFailed,`
 - `kStatus_SDHC_CardEraseBlocksFailed,`
 - `kStatus_SDHC_InvalidIORange,`

kSdhcRespTypeR7 }

```

64.5.2 Data Structure Documentation

64.5.2.1 struct sdhc_user_config_t

Defines the configuration data structure to initialize the SDHC.

Data Fields

- uint32_t **clock**
Clock rate.
- sdhc_transfer_mode_t **transMode**
SDHC transfer mode.
- sdhc_cd_type_t **cdType**
Card detection type.
- void(* **cardDetectCallback**)(bool inserted)

SDHC Data Types

- *Callback function for card detect occurs.*
void(* [cardIntCallback](#))(void)
- *Callback function for card interrupt occurs.*
void(* [blockGapCallback](#))(void)
- *Callback function for block gap occurs.*

64.5.2.2 struct sdhc_host_t

Defines the Host device structure which includes both the static and the runtime SDHC information.

Data Fields

- uint32_t [instance](#)
Host instance index.
- [sdhc_cd_type_t](#) [cdType](#)
Host controller card detection type.
- [sdhc_hal_endian_t](#) [endian](#)
Endian mode the host's working at.
- uint32_t [swFeature](#)
Host controller driver features.
- uint32_t [flags](#)
Host flags.
- uint32_t [busWidth](#)
Current busWidth.
- uint32_t [caps](#)
Host capability.
- uint32_t [ocrSupported](#)
Supported OCR.
- uint32_t [clock](#)
Current clock frequency.
- [sdhc_power_mode_t](#) [powerMode](#)
Current power mode.
- uint32_t [maxClock](#)
Maximum clock supported.
- uint32_t [maxBlockSize](#)
Maximum block size supported.
- uint32_t [maxBlockCount](#)
Maximum block count supported.
- uint32_t * [admaTableAddress](#)
ADMA table address.
- struct SdhcRequest * [currentReq](#)
Associated request.
- void(* [cardIntCallback](#))(void)
Callback function for card interrupt occurs.
- void(* [cardDetectCallback](#))(bool inserted)
Callback function for card detect occurs.
- void(* [blockGapCallback](#))(void)
Callback function for block gap occurs.

64.5.2.3 struct sdhc_data_t

Defines the SDHC data structure including the block size/count and flags.

Data Fields

- struct SdhcRequest * **req**
Associated request.
- uint32_t **blockSize**
Block size.
- uint32_t **blockCount**
Block count.
- uint32_t **bytesTransferred**
Transferred buffer.
- uint32_t * **buffer**
Data buffer.

64.5.2.4 struct sdhc_request_t

Defines the SDHC request structure including the command index, argument, flags, response, and data.

Data Fields

- uint32_t **cmdIndex**
Command index.
- uint32_t **argument**
Command argument.
- uint32_t **flags**
Flags.
- **sdhc_resp_type_t** **respType**
Response type.
- volatile uint32_t **error**
Command error code.
- uint32_t **cardErrStatus**
Card error status from response 1.
- uint32_t **response** [4]
Response for this command.
- **semaphore_t** * **complete**
Request completion sync object.
- struct SdhcData * **data**
Data associated with request.

SDHC Data Types

64.5.3 Enumeration Type Documentation

64.5.3.1 enum sdhc_status_t

Enumerator

kStatus_SDHC_NoError No error.

kStatus_SDHC_InitFailed Driver initialization failed.

kStatus_SDHC_SetClockFailed Failed to set clock of host controller.

kStatus_SDHC_SetCardToIdle Failed to set card to idle.

kStatus_SDHC_SetCardBlockSizeFailed Failed to set card block size.

kStatus_SDHC_SendAppOpCondFailed Failed to send app_op_cond command.

kStatus_SDHC_AllSendCidFailed Failed to send all_send_cid command.

kStatus_SDHC_SendRcaFailed Failed to send send_rca command.

kStatus_SDHC_SendCsdFailed Failed to send send_csd command.

kStatus_SDHC_SendScrFailed Failed to send send_scr command.

kStatus_SDHC_SelectCardFailed Failed to send select_card command.

kStatus_SDHC_SwitchHighSpeedFailed Failed to switch to high speed mode.

kStatus_SDHC_SetCardWideBusFailed Failed to set card's bus mode.

kStatus_SDHC_SetBusWidthFailed Failed to set host's bus mode.

kStatus_SDHC_SendCardStatusFailed Failed to send card status.

kStatus_SDHC_StopTransmissionFailed Failed to stop transmission.

kStatus_SDHC_CardEraseBlocksFailed Failed to erase blocks.

kStatus_SDHC_InvalidIORange Invalid read/write/erase address range.

kStatus_SDHC_BlockSizeNotSupportError Unsupported block size.

kStatus_SDHC_HostIsAlreadyInitiated Host controller is already initialized.

kStatus_SDHC_HostNotSupport Host not error.

kStatus_SDHC_HostIsBusyError Bus busy error.

kStatus_SDHC_DataPrepareError Data preparation error.

kStatus_SDHC_WaitTimeoutError Wait timeout error.

kStatus_SDHC_OutOfMemory Out of memory error.

kStatus_SDHC_IoError General IO error.

kStatus_SDHC_CmdIoError CMD I/O error.

kStatus_SDHC_DataIoError Data I/O error.

kStatus_SDHC_InvalidParameter Invalid parameter error.

kStatus_SDHC_RequestFailed Request failed.

kStatus_SDHC_RequestCardStatusError Status error.

kStatus_SDHC_SwitchFailed Switch failed.

kStatus_SDHC_NotSupportYet Not support.

kStatus_SDHC_TimeoutError Timeout error.

kStatus_SDHC_CardNotSupport Card does not support.

kStatus_SDHC_CmdError CMD error.

kStatus_SDHC_DataError Data error.

kStatus_SDHC_DmaAddressError DMA address error.

kStatus_SDHC_Failed General failed.

kStatus_SDHC_NoMedium No medium error.
kStatus_SDHC_UnknownStatus Unknown if card is present.

64.5.3.2 enum sdhc_cd_type_t

Enumerator

kSdhcCardDetectGpio Use GPIO for card detection.
kSdhcCardDetectDat3 Use DAT3 for card detection.
kSdhcCardDetectCdPin Use host controller dedicate CD pin for card detection.
kSdhcCardDetectPollDat3 Poll DAT3 for card detection.
kSdhcCardDetectPollCd Poll host controller dedicate CD pin for card detection.

64.5.3.3 enum sdhc_power_mode_t

Enumerator

kSdhcPowerModeRunning SDHC is running.
kSdhcPowerModeSuspended SDHC is suspended.
kSdhcPowerModeStopped SDHC is stopped.

64.5.3.4 enum sdhc_buswidth_t

Enumerator

kSdhcBusWidth1Bit 1-bit bus width.
kSdhcBusWidth4Bit 4-bit bus width.
kSdhcBusWidth8Bit 8-bit bus width.

64.5.3.5 enum sdhc_transfer_mode_t

Enumerator

kSdhcTransModePio Transfer mode: PIO.
kSdhcTransModeSdma Transfer mode: SDMA.
kSdhcTransModeAdma1 Transfer mode: ADMA1.
kSdhcTransModeAdma2 Transfer mode: ADMA2.

SDHC Data Types

64.5.3.6 enum sdhc_resp_type_t

Enumerator

kSdhcRespTypeNone Response type: none.

kSdhcRespTypeR1 Response type: R1.

kSdhcRespTypeR1b Response type: R1b.

kSdhcRespTypeR2 Response type: R2.

kSdhcRespTypeR3 Response type: R3.

kSdhcRespTypeR4 Response type: R4.

kSdhcRespTypeR5 Response type: R5.

kSdhcRespTypeR5b Response type: R5b.

kSdhcRespTypeR6 Response type: R6.

kSdhcRespTypeR7 Response type: R7.

64.6 SDHC HAL

64.6.1 Overview

This section describes the programming interface of the SDHC HAL driver.

Data Structures

- struct [sdhc_hal_basic_info_t](#)
Data structure to get the basic information of SDHC. [More...](#)
- struct [sdhc_hal_sdclk_config_t](#)
SD clock configuration to configure the clock of SD protocol unit. [More...](#)
- struct [sdhc_mmcboot_param_t](#)
Data structure to configure the MMC boot feature. [More...](#)
- struct [sdhc_hal_config_t](#)
Data structure to initialize the SDHC. [More...](#)
- struct [sdhc_hal_cmd_req_t](#)
Command request structure. [More...](#)

Macros

- #define [SDHC_HAL_ADMA1_ADDR_ALIGN](#) (4096)
SDHC ADMA address alignment size and length alignment size.

Enumerations

- enum [sdhc_hal_mmcboot_t](#)
MMC card BOOT type.
- enum [sdhc_hal_led_t](#)
Led control status.
- enum [sdhc_hal_dtw_t](#)
Data transfer width.
- enum [sdhc_hal_endian_t](#)
SDHC endian mode.
- enum [sdhc_hal_dma_mode_t](#)
SDHC DMA mode.
- enum [sdhc_hal_curstat_type_t](#) {

SDHC HAL

- kSdhcHalIsCmdInhibit,
- kSdhcHalIsDataInhibit,
- kSdhcHalIsDataLineActive,

- kSdhcHalGetDataLine4Level,
- kSdhcHalGetDataLine5Level,
- kSdhcHalGetDataLine6Level,
- kSdhcHalGetDataLine7Level,
- kSdhcHalGetCdTestLevel }
Current SDHC status type.
- enum `sdhc_hal_err_type_t` {
 kAc12Err,
 kAdmaErr }
SDHC error type.

SDHC HAL FUNCTION

- void `SDHC_HAL_SendCmd` (SDHC_Type *base, const `sdhc_hal_cmd_req_t` *cmdReq)
Sends command to card.
- static void `SDHC_HAL_SetData` (SDHC_Type *base, uint32_t data)
Fills the the data port.
- static uint32_t `SDHC_HAL_GetData` (SDHC_Type *base)
Retrieves the data from the data port.
- bool `SDHC_HAL_GetCurState` (SDHC_Type *base, `sdhc_hal_curstat_type_t` stateType)
Gets the current card's status.
- static void `SDHC_HAL_SetDataTransferWidth` (SDHC_Type *base, `sdhc_hal_dtw_t` dtw)
Sets the data transfer width.
- static void `SDHC_HAL_SetContinueRequest` (SDHC_Type *base)
Restarts a transaction which has stopped at the block gap.
- void `SDHC_HAL_Config` (SDHC_Type *base, const `sdhc_hal_config_t` *initConfig)
Initialize the SDHC according to the configuration user input.
- void `SDHC_HAL_ConfigSdClock` (SDHC_Type *base, `sdhc_hal_sdclk_config_t` *clkConfItms)

- *Sets SDHC SD protocol unit clock.*
- static uint32_t [SDHC_HAL_GetIntFlags](#) (SDHC_Type *base)
Gets the current interrupt status.
- static void [SDHC_HAL_ClearIntFlags](#) (SDHC_Type *base, uint32_t mask)
Clears a specified interrupt status.
- void [SDHC_HAL_GetAllErrStatus](#) (SDHC_Type *base, [sdhc_hal_err_type_t](#) errType, uint32_t *errFlags)
Gets the error status of SDHC.
- static void [SDHC_HAL_SetForceEventFlags](#) (SDHC_Type *base, uint32_t mask)
Sets the force events according to the given mask.
- static void [SDHC_HAL_SetAdmaAddress](#) (SDHC_Type *base, uint32_t address)
Sets the ADMA address.
- uint32_t [SDHC_HAL_GetResponse](#) (SDHC_Type *base, uint32_t index)
Gets the command response.
- void [SDHC_HAL_SetIntSignal](#) (SDHC_Type *base, bool enable, uint32_t mask)
Enables the specified interrupts.
- void [SDHC_HAL_SetIntState](#) (SDHC_Type *base, bool enable, uint32_t mask)
Enables the specified interrupt state.
- uint32_t [SDHC_HAL_Reset](#) (SDHC_Type *base, uint32_t type, uint32_t timeout)
Performs an SDHC reset.
- uint32_t [SDHC_HAL_InitCard](#) (SDHC_Type *base, uint32_t timeout)
Sends 80 clocks to the card to initialize the card.
- void [SDHC_HAL_Init](#) (SDHC_Type *base)
Initializes the SDHC HAL.
- void [SDHC_HAL_GetBasicInfo](#) (SDHC_Type *base, [sdhc_hal_basic_info_t](#) *basicInfo)
Gets the capability of SDHC.

64.6.2 Data Structure Documentation

64.6.2.1 struct sdhc_hal_basic_info_t

Data Fields

- uint8_t [specVer](#)
Save the specification version.
- uint8_t [vendorVer](#)
Save the vendor version.
- uint16_t [maxBlkLen](#)
Save the maximum block length.
- uint32_t [capability](#)
The capability flags.

SDHC HAL

64.6.2.2 struct sdhc_hal_sdclk_config_t

64.6.2.3 struct sdhc_mmcboot_param_t

Data Fields

- uint32_t [ackTimeout](#)
Sets the timeout value for the boot ACK.
- [sdhc_hal_mmcboot_t mode](#)
Configures the boot mode.
- uint32_t [blockCount](#)
Configures the the block count for the boot.

64.6.2.3.0.14 Field Documentation

64.6.2.3.0.14.1 uint32_t sdhc_mmcboot_param_t::ackTimeout

64.6.2.3.0.14.2 sdhc_hal_mmcboot_t sdhc_mmcboot_param_t::mode

64.6.2.3.0.14.3 uint32_t sdhc_mmcboot_param_t::blockCount

64.6.2.4 struct sdhc_hal_config_t

Data Fields

- [sdhc_hal_led_t ledState](#)
Sets the LED state.
- [sdhc_hal_endian_t endianMode](#)
Configures the endian mode.
- [sdhc_hal_dma_mode_t dmaMode](#)
Sets the DMA mode.
- uint8_t [writeWatermarkLevel](#)
Sets the watermark for writing.
- uint8_t [readWatermarkLevel](#)
Sets the watermark for reading.
- uint32_t [enFlags](#)
Enable or disable corresponding feature.
- [sdhc_mmcboot_param_t bootParams](#)
Configuration read MMC card boot data feature.

64.6.2.4.0.15 Field Documentation

64.6.2.4.0.15.1 `sdhc_hal_led_t` `sdhc_hal_config_t::ledState`

64.6.2.4.0.15.2 `sdhc_hal_endian_t` `sdhc_hal_config_t::endianMode`

64.6.2.4.0.15.3 `sdhc_hal_dma_mode_t` `sdhc_hal_config_t::dmaMode`

64.6.2.4.0.15.4 `uint8_t` `sdhc_hal_config_t::writeWatermarkLevel`

64.6.2.4.0.15.5 `uint8_t` `sdhc_hal_config_t::readWatermarkLevel`

64.6.2.5 struct `sdhc_hal_cmd_req_t`

Data Fields

- `uint32_t` [dataBlkSize](#)
Command data Block size.
- `uint32_t` [dataBlkCount](#)
Command data Block count.
- `uint32_t` [arg](#)
Command argument.
- `uint32_t` [index](#)
Command index.
- `uint32_t` [flags](#)
Command Flags.

64.6.3 Enumeration Type Documentation

64.6.3.1 enum `sdhc_hal_curstat_type_t`

Enumerator

kSdhcHallsCmdInhibit Checks whether the command inhibit bit is set or not.

kSdhcHallsDataInhibit Checks whether data inhibit bit is set or not.

kSdhcHallsDataLineActive Checks whether data line is active.

kSdhcHallsSdClockStable Checks whether the SD clock is stable or not.

kSdhcHallsIpgClockOff Checks whether the IPG clock is off or not.

kSdhcHallsSysClockOff Checks whether the system clock is off or not.

kSdhcHallsPeripheralClockOff Checks whether the peripheral clock is off or not.

kSdhcHallsSdClkOff Checks whether the SD clock is off or not.

kSdhcHallsWriteTransferActive Checks whether the write transfer is active or not.

kSdhcHallsReadTransferActive Checks whether the read transfer is active or not.

kSdhcHallsBuffWriteEnabled Check whether the buffer write is enabled or not.

kSdhcHallsBuffReadEnabled Checks whether the buffer read is enabled or not.

kSdhcHallsCardInserted Checks whether the card is inserted or not.

kSdhcHallsCmdLineLevelHigh Checks whether the command line signal is high or not.

SDHC HAL

kSdhcHalGetDataLine0Level Gets the data line 0 signal level or not.
kSdhcHalGetDataLine1Level Gets the data line 1 signal level or not.
kSdhcHalGetDataLine2Level Gets the data line 2 signal level or not.
kSdhcHalGetDataLine3Level Gets the data line 3 signal level or not.
kSdhcHalGetDataLine4Level Gets the data line 4 signal level or not.
kSdhcHalGetDataLine5Level Gets the data line 5 signal level or not.
kSdhcHalGetDataLine6Level Gets the data line 6 signal level or not.
kSdhcHalGetDataLine7Level Gets the data line 7 signal level or not.
kSdhcHalGetCdTestLevel Gets the card detect test level.

64.6.3.2 enum sdhc_hal_err_type_t

Enumerator

kAc12Err Auto CMD12 error.
kAdmaErr ADMA error.

64.6.4 Function Documentation

64.6.4.1 void SDHC_HAL_SendCmd (SDHC_Type * *base*, const sdhc_hal_cmd_req_t * *cmdReq*)

Parameters

| | |
|---------------|---------------------------|
| <i>base</i> | SDHC base address |
| <i>cmdReq</i> | command request structure |

64.6.4.2 static void SDHC_HAL_SetData (SDHC_Type * *base*, uint32_t *data*) [inline], [static]

Parameters

| | |
|-------------|---------------------------|
| <i>base</i> | SDHC base address |
| <i>data</i> | the data about to be sent |

64.6.4.3 static uint32_t SDHC_HAL_GetData (SDHC_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | SDHC base address |
|-------------|-------------------|

Returns

the data has been read

64.6.4.4 bool SDHC_HAL_GetCurState (SDHC_Type * *base*, sdhc_hal_curstat_type_t *stateType*)

Parameters

| | |
|------------------|-------------------|
| <i>base</i> | SDHC base address |
| <i>stateType</i> | The status type. |

Returns

the status if happened corresponding to stateType

- true: status flag has been set
- false: status flag has not been set

64.6.4.5 static void SDHC_HAL_SetDataTransferWidth (SDHC_Type * *base*, sdhc_hal_dtw_t *dtw*) [inline], [static]

Parameters

| | |
|-------------|---------------------|
| <i>base</i> | SDHC base address |
| <i>dtw</i> | data transfer width |

64.6.4.6 static void SDHC_HAL_SetContinueRequest (SDHC_Type * *base*) [inline], [static]

Parameters

SDHC HAL

| | |
|-------------|-------------------|
| <i>base</i> | SDHC base address |
|-------------|-------------------|

64.6.4.7 void SDHC_HAL_Config (SDHC_Type * *base*, const sdhc_hal_config_t * *initConfig*)

Parameters

| | |
|-------------------|-----------------------------|
| <i>base</i> | SDHC base address |
| <i>initConfig</i> | The configuration structure |

64.6.4.8 void SDHC_HAL_ConfigSdClock (SDHC_Type * *base*, sdhc_hal_sdclk_config_t * *clkConfltms*)

Parameters

| | |
|--------------------|--|
| <i>base</i> | SDHC base address |
| <i>clkConfltms</i> | SDHC SD protocol unit clock configuration items. |

64.6.4.9 static uint32_t SDHC_HAL_GetIntFlags (SDHC_Type * *base*) [inline], [static]

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | SDHC base address |
|-------------|-------------------|

Returns

current interrupt flags

64.6.4.10 static void SDHC_HAL_ClearIntFlags (SDHC_Type * *base*, uint32_t *mask*) [inline], [static]

Parameters

| | |
|-------------|--|
| <i>base</i> | SDHC base address |
| <i>mask</i> | to specify interrupts' flags to be cleared |

64.6.4.11 void SDHC_HAL_GetAllErrStatus (SDHC_Type * *base*, sdhc_hal_err_type_t *errType*, uint32_t * *errFlags*)

Parameters

| | |
|-----------------|------------------------|
| <i>base</i> | SDHC base address |
| <i>errType</i> | the error type |
| <i>errFlags</i> | the result error flags |

64.6.4.12 static void SDHC_HAL_SetForceEventFlags (SDHC_Type * *base*, uint32_t *mask*) [inline], [static]

Parameters

| | |
|-------------|--|
| <i>base</i> | SDHC base address |
| <i>mask</i> | to specify the force events' flags to be set |

64.6.4.13 static void SDHC_HAL_SetAdmaAddress (SDHC_Type * *base*, uint32_t *address*) [inline], [static]

Parameters

| | |
|----------------|-------------------|
| <i>base</i> | SDHC base address |
| <i>address</i> | for ADMA transfer |

64.6.4.14 uint32_t SDHC_HAL_GetResponse (SDHC_Type * *base*, uint32_t *index*)

SDHC HAL

Parameters

| | |
|--------------|---|
| <i>base</i> | SDHC base address |
| <i>index</i> | of response register, range from 0 to 3 |

Returns

The command response value.

64.6.4.15 void SDHC_HAL_SetIntSignal (SDHC_Type * *base*, bool *enable*, uint32_t *mask*)

Parameters

| | |
|---------------|---------------------------------------|
| <i>base</i> | SDHC base address |
| <i>enable</i> | enable or disable |
| <i>mask</i> | to specify interrupts to be isEnabled |

64.6.4.16 void SDHC_HAL_SetIntState (SDHC_Type * *base*, bool *enable*, uint32_t *mask*)

Parameters

| | |
|---------------|--|
| <i>base</i> | SDHC base address |
| <i>enable</i> | enable or disable |
| <i>mask</i> | to specify interrupts' state to be enabled |

64.6.4.17 uint32_t SDHC_HAL_Reset (SDHC_Type * *base*, uint32_t *type*, uint32_t *timeout*)

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | SDHC base address |
|-------------|-------------------|

| | |
|----------------|-------------------|
| <i>type</i> | the type of reset |
| <i>timeout</i> | timeout for reset |

Returns

0 on success, else on error

64.6.4.18 uint32_t SDHC_HAL_InitCard (SDHC_Type * *base*, uint32_t *timeout*)

Parameters

| | |
|----------------|-----------------------------|
| <i>base</i> | SDHC base address |
| <i>timeout</i> | timeout for initialize card |

Returns

0 on success, else on error

64.6.4.19 void SDHC_HAL_Init (SDHC_Type * *base*)

Parameters

| | |
|-------------|-------------------|
| <i>base</i> | SDHC base address |
|-------------|-------------------|

64.6.4.20 void SDHC_HAL_GetBasicInfo (SDHC_Type * *base*, sdhc_hal_basic_info_t * *basicInfo*)

Parameters

| | |
|------------------|---------------------------------|
| <i>base</i> | SDHC base address |
| <i>basicInfo</i> | Pointer to user data structure. |

SDHC Peripheral Driver

64.7 SDHC Peripheral Driver

64.7.1 Overview

This section describes the programming interface of the SDCH Peripheral driver. The SDHC driver configures the secure digital host controller and provides an easy way to operate the SDHC module.

64.7.2 SDHC Initialization

To initialize the SDHC module, call the [SDHC_DRV_Init\(\)](#) function and pass in the configuration data structure.

This is an example code to initialize and configure the driver:

```
// Define device configuration.
sdhc_user_config_t config = {0};

config.clock = 0;

// Initialize
if (SDHC_DRV_Init(instance, &host, &config) != kStatus_SDHC_NoError)
{
    // error occurs //
}
else
{
    // SDHC has been successfully initialized //
}
```

64.7.3 SDHC Issuing a request to the card

The SDHC driver provides a simple way to send commands to and retrieve response/data from the card.

This is an example to send the SD_SWITCH command to the card.

```
sdhc_request_t req = {0};
sdhc_data_t data = {0};

req.cmdIndex = kSdSwitch; // Set command index //
req.argument = mode << 31 | 0x00FFFFFF; // Set argument //
req.argument &= ~(0xF) << (group * 4);
req.argument |= value << (group * 4);
req.flags = FSL_SDHC_REQ_FLAGS_DATA_READ; // Set command flags //
req.respType = kSdhcRespTypeR1; // Set response type //

data.blockSize = 64; // Set data block size //
data.blockCount = 1; // Set data block count //
data.buffer = response; // Set data buffer //

// link data, command with request //
data.req = &req;
req.data = &data;
if (kStatus_SDHC_NoError != SDHC_DRV_IssueRequestBlocking(
    card->hostInstance,
    &req,
    FSL_SDCARD_REQUEST_TIMEOUT);) // issue request //
```

```

{
    // error occurs //
}
else
{
    // request has been issued successfully //
}

```

This section describes the programming interface of the SDHC Peripheral Driver.

SDHC PD FUNCTION

- `sdhc_status_t SDHC_DRV_Init` (uint32_t instance, `sdhc_host_t *host`, const `sdhc_user_config_t *config`)
Initializes the Host controller with a specific instance index.
- `sdhc_status_t SDHC_DRV_Shutdown` (uint32_t instance)
Destroys the host controller.
- `sdhc_status_t SDHC_DRV_DetectCard` (uint32_t instance)
Checks whether the card is present on a specified host controller.
- `sdhc_status_t SDHC_DRV_ConfigClock` (uint32_t instance, uint32_t clock)
Sets the clock frequency of the host controller.
- `sdhc_status_t SDHC_DRV_SetBusWidth` (uint32_t instance, `sdhc_buswidth_t busWidth`)
Sets the bus width of the host controller.
- `sdhc_status_t SDHC_DRV_IssueRequestBlocking` (uint32_t instance, `sdhc_request_t *req`, uint32_t timeoutInMs)
Issues the request on a specific host controller and returns on completion.
- void `SDHC_DRV_DoIrq` (uint32_t instance)
IRQ handler for SDHC.

64.7.4 Function Documentation

64.7.4.1 `sdhc_status_t SDHC_DRV_Init` (uint32_t *instance*, `sdhc_host_t * host`, const `sdhc_user_config_t * config`)

This function initializes the SDHC module according to the given initialization configuration structure including the clock frequency, bus width, and card detect callback.

Parameters

| | |
|-----------------|---|
| <i>instance</i> | the specific instance index |
| <i>host</i> | pointer to a place storing the <code>sdhc_host_t</code> structure |

SDHC Peripheral Driver

| | |
|---------------|-----------------------------------|
| <i>config</i> | initialization configuration data |
|---------------|-----------------------------------|

Returns

kStatus_SDHC_NoError if success

64.7.4.2 sdhc_status_t SDHC_DRV_Shutdown (uint32_t instance)

Parameters

| | |
|-----------------|---------------------------------------|
| <i>instance</i> | the instance index of host controller |
|-----------------|---------------------------------------|

Returns

kStatus_SDHC_NoError if success

64.7.4.3 sdhc_status_t SDHC_DRV_DetectCard (uint32_t instance)

This function checks if there's a card inserted in the SDHC.

Parameters

| | |
|-----------------|---------------------------------------|
| <i>instance</i> | the instance index of host controller |
|-----------------|---------------------------------------|

Returns

kStatus_SDHC_NoError on success

64.7.4.4 sdhc_status_t SDHC_DRV_ConfigClock (uint32_t instance, uint32_t clock)

Parameters

| | |
|-----------------|---|
| <i>instance</i> | the instance index of host controller |
| <i>clock</i> | the desired frequency to be set to controller |

Returns

kStatus_SDHC_NoError on success

64.7.4.5 sdhc_status_t SDHC_DRV_SetBusWidth (uint32_t *instance*, sdhc_buswidth_t *busWidth*)

Parameters

| | |
|-----------------|---|
| <i>instance</i> | the instance index of host controller |
| <i>busWidth</i> | the desired bus width to be set to controller |

Returns

kStatus_SDHC_NoError on success

64.7.4.6 sdhc_status_t SDHC_DRV_IssueRequestBlocking (uint32_t *instance*, sdhc_request_t * *req*, uint32_t *timeoutInMs*)

This function issues the request to the card on a specific SDHC. The command is sent and is blocked as long as the response/data is sending back from the card.

Parameters

| | |
|--------------------|---------------------------------------|
| <i>instance</i> | the instance index of host controller |
| <i>req</i> | the pointer to the request |
| <i>timeoutInMs</i> | timeout value in microseconds |

Returns

kStatus_SDHC_NoError on success

64.7.4.7 void SDHC_DRV_Dolrq (uint32_t *instance*)

This function deals with IRQs on the given host controller.

SDHC Peripheral Driver

Parameters

| | |
|-----------------|---------------------------------------|
| <i>instance</i> | the instance index of host controller |
|-----------------|---------------------------------------|

64.8 SDHC Standard Definition

64.8.1 Overview

This section describes the host controller standard definition.

Macros

SD Card SPI Driver

64.9 SD Card SPI Driver

The chapter describes the programming interface of the card driver over SPI.

64.10 SD Card SPI Data Definition

The chapter describes the programming interface of the card data definition over SPI.

Chapter 65

Synchronous DRAM Controller (SDRAM)

65.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Synchronous DRAM Controller block of Kinetis devices.

Modules

- [SDRAMC HAL driver](#)
- [SDRAMC Peripheral driver](#)

SDRAMC HAL driver

65.2 SDRAMC HAL driver

65.2.1 Overview

This section describes the programming interface of the SDRAMC HAL driver.

Data Structures

- struct `s dram_blockctl_configure_t`
SDRAM control configuration structure for each SDRAM block. [More...](#)

Macros

- #define `SDRAM_ONESEC_NANOSECOND` 1000000000U
Define SDRAM one second with nanosecond.

Enumerations

- enum `s dram_refresh_time_t` {
 `kSDRAMRefreshThreeClocks` = 0x0U,
 `kSDRAMRefreshSixClocks` = 0x1U,
 `kSDRAMRefreshNineClocks` = 0x2U }
SDRAM auto-refresh timing.
- enum `s dram_latency_t` { ,
 `kSDRAMLatencyOne` = 0x1U,
 `kSDRAMLatencyTwo` = 0x2U,
 `kSDRAMLatencyThree` = 0x3U }
Setting latency for SDRAM timing specifications.
- enum `s dram_command_bit_location_t` {
 `kSDRAMCommandbit17` = 0x0U,
 `kSDRAMCommandbit18` = 0x1U,
 `kSDRAMCommandbit19` = 0x2U,
 `kSDRAMCommandbit20` = 0x3U,
 `kSDRAMCommandbit21` = 0x4U,
 `kSDRAMCommandbit22` = 0x5U,
 `kSDRAMCommandbit23` = 0x6U,
 `kSDRAMCommandbit24` = 0x7U }
SDRAM command bit location.
- enum `s dram_command_t` {
 `kSDRAMMrsCommand` = 0x0U,
 `kSDRAMPrechargeCommand` = 0x1U }
SDRAM command.
- enum `s dram_port_size_t` {

```
kSDRAM32BitPortSize = 0x0U,
kSDRAM8BitPortSize = 0x1U,
kSDRAM16BitPortSize = 0x2U }
```

SDRAM port size.

- enum `sdram_block_selection_t` {

```
kSDRAMBlock0 = 0x0U,
kSDRAMBlock1 = 0x1U }
```

SDRAM block selection.

SDRAM HAL configuration

- void `SDRAM_HAL_Init` (SDRAM_Type *base)

Sets all registers of the SDRAM controller.
- static void `SDRAM_HAL_SendSelfRefreshCmd` (SDRAM_Type *base)

Sends the self-refresh command to SDRAM.
- static void `SDRAM_HAL_SendSelfRefreshExitCmd` (SDRAM_Type *base)

Sends the self-refresh exit command to SDRAM.
- void `SDRAM_HAL_SetBlockControl` (SDRAM_Type *base, `sdram_block_selection_t` whichBlock, `sdram_blockctl_configure_t` *configure)

Sets the control for the SDRAM block.
- void `SDRAM_HAL_SetAutoRefresh` (SDRAM_Type *base, `sdram_refresh_time_t` refreshTime, `uint32_t` busClock, `uint32_t` rowRefresh)

Sets auto-refresh time and frequency.
- void `SDRAM_HAL_SetRefreshCmd` (SDRAM_Type *base, `sdram_block_selection_t` whichBlock, bool enable)

Enables/disables the refresh.
- static void `SDRAM_HAL_SetAddressMask` (SDRAM_Type *base, `sdram_block_selection_t` whichBlock, `uint32_t` mask)

Sets the base address mask.
- void `SDRAM_HAL_SendCommand` (SDRAM_Type *base, `sdram_block_selection_t` whichBlock, `sdram_command_t` command)

Sends the command to SDRAM.
- bool `SDRAM_HAL_IsCommandFinished` (SDRAM_Type *base, `sdram_block_selection_t` whichBlock, `sdram_command_t` command)

Gets the command execute status.
- void `SDRAM_HAL_SetWriteProtectCmd` (SDRAM_Type *base, `sdram_block_selection_t` whichBlock, bool enable)

Enables/disables the write protection.
- void `SDRAM_HAL_SetOperateValidCmd` (SDRAM_Type *base, `sdram_block_selection_t` whichBlock, bool enable)

Enables/disables the operation valid.

SDRAMC HAL driver

65.2.2 Data Structure Documentation

65.2.2.1 struct sdram_blockctl_configure_t

Defines a control configuration structure for each SDRAM block.

65.2.3 Enumeration Type Documentation

65.2.3.1 enum sdram_refresh_time_t

Enumerator

kSDRAMRefreshThreeClocks The refresh timing with three bus clocks.

kSDRAMRefreshSixClocks The refresh timing with six bus clocks.

kSDRAMRefreshNineClocks The refresh timing with nine bus clocks.

65.2.3.2 enum sdram_latency_t

The latency setting will affect the following SDRAM timing specifications:

- trcd: SRAS assertion to SCAS assertion
- tcasl: SCAS assertion to data out
- tras: ACTV command to Precharge command
- trp: Precharge command to ACTV command
- trwl, trdl: Last data input to Precharge command
- tep: Last data out to Precharge command

the details of the latency setting and timing specifications are shown on the following table list:

latency trcd: tcasl tras trp trwl, trdl tep

0 1 bus clock 1 bus clock 2 bus clocks 1 bus clock 1 bus clock 1 bus clock

1 2 bus clock 2 bus clock 4 bus clocks 2 bus clock 1 bus clock 1 bus clock

2 3 bus clock 3 bus clock 6 bus clocks 3 bus clock 1 bus clock 1 bus clock

3 3 bus clock 3 bus clock 6 bus clocks 3 bus clock 1 bus clock 1 bus clock

Enumerator

kSDRAMLatencyOne Latency 0.

kSDRAMLatencyTwo Latency 1.

kSDRAMLatencyThree Latency 2.

65.2.3.3 enum sdram_command_bit_location_t

Enumerator

kSDRAMCommandbit17 Command bit location is bit 17.

kSDRAMCommandbit18 Command bit location is bit 18.
kSDRAMCommandbit19 Command bit location is bit 19.
kSDRAMCommandbit20 Command bit location is bit 20.
kSDRAMCommandbit21 Command bit location is bit 21.
kSDRAMCommandbit22 Command bit location is bit 22.
kSDRAMCommandbit23 Command bit location is bit 23.
kSDRAMCommandbit24 Command bit location is bit 24.

65.2.3.4 enum sdram_command_t

Enumerator

kSDRAMMrsCommand Initiate mrs command.
kSDRAMPrechargeCommand Initiate precharge command.

65.2.3.5 enum sdram_port_size_t

Enumerator

kSDRAM32BitPortSize 32-BIT port size.
kSDRAM8BitPortSize 8-Bit port size.
kSDRAM16BitPortSize 16-Bit port size.

65.2.3.6 enum sdram_block_selection_t

Enumerator

kSDRAMBlock0 Select SDRAM block 0.
kSDRAMBlock1 Select SDRAM block 1.

65.2.4 Function Documentation

65.2.4.1 void SDRAM_HAL_Init (SDRAM_Type * base)

Parameters

SDRAMC HAL driver

| | |
|-------------|---|
| <i>base</i> | Register base address for SDRAM controller. |
|-------------|---|

**65.2.4.2 static void SDRAM_HAL_SendSelfRefreshCmd (SDRAM_Type * *base*)
[inline], [static]**

Parameters

| | |
|-------------|----------------------------------|
| <i>base</i> | Register base address for SDRAM. |
|-------------|----------------------------------|

**65.2.4.3 static void SDRAM_HAL_SendSelfRefreshExitCmd (SDRAM_Type * *base*)
[inline], [static]**

Parameters

| | |
|-------------|----------------------------------|
| <i>base</i> | Register base address for SDRAM. |
|-------------|----------------------------------|

**65.2.4.4 void SDRAM_HAL_SetBlockControl (SDRAM_Type * *base*, sdr -
block_selection_t *whichBlock*, sdr_blockctl_configure_t * *configure*
)**

Sets the port size, specification latency, command bit, and address for the SDRAM block.

Parameters

| | |
|-------------------|--|
| <i>base</i> | Register base address for SDRAM. |
| <i>whichBlock</i> | The block which is selected. |
| <i>configure</i> | The control configuration structure for the SDRAM block. |

**65.2.4.5 void SDRAM_HAL_SetAutoRefresh (SDRAM_Type * *base*, sdr -
refresh_time_t *refreshTime*, uint32_t *busClock*, uint32_t *rowRefresh*
)**

The refresh time determinate numbers of bus clocks inserted between REF command and the next possible ACTV command and auto refresh frequency.

Parameters

| | |
|--------------------|---|
| <i>base</i> | Register base address for SDRAM. |
| <i>refreshTime</i> | The number of bus clocks inserted between a REF command and the next ACTV command. See to "sdram_refresh_time_t" |
| <i>busClock</i> | The bus clock. |
| <i>rowRefresh</i> | The refresh time of each row in SDRAM. The unit of the rowRefresh is nanosecond. For example the SDRAM with the 4096 rows/64 ms has the rowRefresh 15625. |

**65.2.4.6 void SDRAM_HAL_SetRefreshCmd (SDRAM_Type * *base*,
sdram_block_selection_t *whichBlock*, bool *enable*)**

Parameters

| | |
|-------------------|----------------------------------|
| <i>base</i> | Register base address for SDRAM. |
| <i>whichBlock</i> | The block which is selected. |
| <i>enable</i> | Enables or disables. |

**65.2.4.7 static void SDRAM_HAL_SetAddressMask (SDRAM_Type * *base*,
sdram_block_selection_t *whichBlock*, uint32_t *mask*) [inline], [static]**

Parameters

| | |
|-------------------|--|
| <i>base</i> | Register base address for SDRAM. |
| <i>whichBlock</i> | The block which is selected. |
| <i>mask</i> | The mask of the address. With the "base address" determine the determines the address range in which the associated DRAM block is located. |

**65.2.4.8 void SDRAM_HAL_SendCommand (SDRAM_Type * *base*,
sdram_block_selection_t *whichBlock*, sdram_command_t *command*)**

Parameters

SDRAMC HAL driver

| | |
|----------------|---|
| <i>base</i> | Register base address for SDRAM. |
| <i>command</i> | The command send to SDRAM. See to "sdrac_command_t" |

65.2.4.9 bool SDRAM_HAL_IsCommandFinished (SDRAM_Type * *base*, sdrac_block_selection_t *whichBlock*, sdrac_command_t *command*)

Parameters

| | |
|----------------|---|
| <i>base</i> | Register base address for SDRAM. |
| <i>command</i> | The command send to SDRAM. See to "sdrac_command_t" |

Returns

the execute status of command

- true, the command is finished.
- false, the command is on-going.

65.2.4.10 void SDRAM_HAL_SetWriteProtectCmd (SDRAM_Type * *base*, sdrac_block_selection_t *whichBlock*, bool *enable*)

Parameters

| | |
|-------------------|----------------------------------|
| <i>base</i> | Register base address for SDRAM. |
| <i>whichBlock</i> | The block which is selected. |
| <i>enable</i> | Enables or disables. |

65.2.4.11 void SDRAM_HAL_SetOperateValidCmd (SDRAM_Type * *base*, sdrac_block_selection_t *whichBlock*, bool *enable*)

Parameters

| | |
|-------------------|----------------------------------|
| <i>base</i> | Register base address for SDRAM. |
| <i>whichBlock</i> | The block which is selected. |

| | |
|---------------|----------------------|
| <i>enable</i> | Enables or disables. |
|---------------|----------------------|

SDRAMC Peripheral driver

65.3 SDRAMC Peripheral driver

65.3.1 Overview

This chapter describes the programming interface of the SDRAMC Peripheral driver. The SDRAMC driver configures and uses the SDRAM controller hardware. It supports module initialization and SDRAMC configuration.

Data Structures

- struct [sdram_refresh_config_t](#)
SDRAM configuration structure for refresh timing. [More...](#)

Functions

- void [SDRAM_DRV_Init](#) (uint32_t instance, [sdram_refresh_config_t](#) *configure, [sdram_block_selection_t](#) whichBlock, [sdram_blockctl_configure_t](#) *ctlConfig)
Initializes the SDRAM controller.
- void [SDRAM_DRV_Deinit](#) (uint32_t instance)
Disables the SDRAM module and gate control.
- void [SDRAM_DRV_SendCommand](#) (uint32_t instance, [sdram_block_selection_t](#) whichBlock, [sdram_command_t](#) command)
Sends the SDRAM command.
- bool [SDRAM_DRV_IsCommandFinished](#) (uint32_t instance, [sdram_block_selection_t](#) whichBlock, [sdram_command_t](#) command)
Gets the SDRAM command execute status.
- void [SDRAM_DRV_SendSelfRefreshCmd](#) (uint32_t instance)
Sends the self-refresh command to SDRAM.
- void [SDRAM_DRV_SendSelfRefreshExitCmd](#) (uint32_t instance)
Sends the self-refresh exit command to SDRAM.
- void [SDRAM_DRV_SetRefreshCmd](#) (uint32_t instance, [sdram_block_selection_t](#) whichBlock, bool enable)
Enables/disables refresh.
- void [SDRAM_DRV_SetWriteProtectCmd](#) (uint32_t instance, [sdram_block_selection_t](#) whichBlock, bool enable)
Enables/disables the write protect.
- void [SDRAM_DRV_SetOperateValidCmd](#) (uint32_t instance, [sdram_block_selection_t](#) whichBlock, bool enable)
Enables/disables the operation valid.

Variables

- SDRAM_Type *const [g_sdramBase](#) []
Table of base addresses for SDRAM instances.
- const IRQn_Type [g_sdramIrqId](#) []
Table to save SDRAM IRQ enumeration numbers defined in the CMSIS header file.

65.3.2 Data Structure Documentation

65.3.2.1 struct sdram_refresh_config_t

Defines a configure structure SDRAMConfig to refresh and uses the [SDRAM_DRV_Init\(\)](#) function to make necessary initializations.

Data Fields

- [sdram_refresh_time_t refreshTime](#)
Trc: The number of bus clocks inserted between a REF and next ACTIVE command.
- [uint32_t sdramRefreshRow](#)
The SDRAM refresh time each row: ns/row.

65.3.2.1.0.16 Field Documentation

65.3.2.1.0.16.1 uint32_t sdram_refresh_config_t::sdramRefreshRow

65.3.3 Function Documentation

65.3.3.1 void SDRAM_DRV_Init (uint32_t instance, sdram_refresh_config_t * configure, sdram_block_selection_t whichBlock, sdram_blockctl_configure_t * ctlConfig)

This function must be called before calling any other SDRAM controller driver functions. This function un-gates the SDRAM controller clock and sets the SDRAM controller clock. Pass in its configuration structure.

Parameters

| | |
|-------------------|------------------------------------|
| <i>instance</i> | SDRAM module instance number. |
| <i>config</i> | The SDRAM configuration structure. |
| <i>whichBlock</i> | The block selection. |
| <i>ctlConfig</i> | The block control configuration |

65.3.3.2 void SDRAM_DRV_Deinit (uint32_t instance)

This function disables the SDRAM controller clock. SDRAM_DRV_Init must be called if you want to use SDRAM again.

SDRAMC Peripheral driver

Parameters

| | |
|-----------------|-------------------------------|
| <i>instance</i> | SDRAM module instance number. |
|-----------------|-------------------------------|

65.3.3.3 void SDRAM_DRV_SendCommand (uint32_t *instance*, sdram_block_selection_t *whichBlock*, sdram_command_t *command*)

This function sends either a precharge or MRS command to SDRAM.

Parameters

| | |
|-------------------|--|
| <i>instance</i> | SDRAM module instance number. |
| <i>whichBlock</i> | The block selection. |
| <i>command</i> | The command, see to "sdram_command_t". |

65.3.3.4 bool SDRAM_DRV_IsCommandFinished (uint32_t *instance*, sdram_block_selection_t *whichBlock*, sdram_command_t *command*)

This function stops and disables the SDRAM carrier generator and modulator. When the SDRAM carrier generator and modulator is disabled the IRO signal can be controlled directly by calling SDRAM_DRV_SetIroCtl function.

Parameters

| | |
|-------------------|--|
| <i>instance</i> | SDRAM module instance number. |
| <i>whichBlock</i> | The block selection. |
| <i>command</i> | The command, see to "sdram_command_t". |

Returns

the execute status of command

- true, the command is finished.
- false, the command is on-going.

65.3.3.5 void SDRAM_DRV_SendSelfRefreshCmd (uint32_t *instance*)

Parameters

| | |
|-----------------|-------------------------------|
| <i>instance</i> | SDRAM module instance number. |
|-----------------|-------------------------------|

65.3.3.6 void SDRAM_DRV_SendSelfRefreshExitCmd (uint32_t *instance*)

Parameters

| | |
|-----------------|-------------------------------|
| <i>instance</i> | SDRAM module instance number. |
|-----------------|-------------------------------|

65.3.3.7 void SDRAM_DRV_SetRefreshCmd (uint32_t *instance*, sdram_block_selection_t *whichBlock*, bool *enable*)

Parameters

| | |
|-------------------|-------------------------------|
| <i>instance</i> | SDRAM module instance number. |
| <i>whichBlock</i> | The block which is selected. |
| <i>enable</i> | Enables or disables. |

65.3.3.8 void SDRAM_DRV_SetWriteProtectCmd (uint32_t *instance*, sdram_block_selection_t *whichBlock*, bool *enable*)

Parameters

| | |
|-------------------|-------------------------------|
| <i>instance</i> | SDRAM module instance number. |
| <i>whichBlock</i> | The block which is selected. |
| <i>enable</i> | Enables or disables. |

65.3.3.9 void SDRAM_DRV_SetOperateValidCmd (uint32_t *instance*, sdram_block_selection_t *whichBlock*, bool *enable*)

Parameters

SDRAMC Peripheral driver

| | |
|-------------------|-------------------------------|
| <i>instance</i> | SDRAM module instance number. |
| <i>whichBlock</i> | The block which is selected. |
| <i>enable</i> | Enables or disables. |

65.3.4 Variable Documentation

65.3.4.1 SDRAM_Type* const g_sdramBase[]

Chapter 66

System Integration Module (SIM)

66.1 Overview

The Kinetis SDK provides a HAL driver for the System Integration Module (SIM) block of Kinetis devices.

Modules

- [SIM HAL driver](#)

SIM HAL driver

66.2 SIM HAL driver

66.2.1 Overview

The section describes the programming interface of the SIM HAL driver. The SIM provides the system control and device configuration registers. The `sim_hal` provides a set of API functions used to access the SIM registers including clock gate control and other configuration settings.

66.2.2 Clock Gate Control register access APIs

Clock gate control is based on the module. Each chip has a subset of modules that can be gated through gate control registers in SIM. The gate control names are defined in the enumeration `sim_clock_gate_name_t`. Pass the enumeration value and the parameter enables/disables the clock for a module accordingly. There is an example for clock gate APIs:

```
#include "fsl_sim_hal.h"

// Calling SIM clock gate control API to enable the clock for UART0 //
SIM_HAL_EnableClock(SIM_BASE, kSimClockGateUart0);

// Calling SIM clock gate control API to disable the clock for UART0 //
SIM_HAL_DisableClock(SIM_BASE, kSimClockGateUart0);

// Get the clock gate status for UART0 //
SIM_HAL_GetGateCmd(SIM_BASE, kSimClockGateUart0);
```

66.2.3 Clock Source Control access APIs

Clock source control is also based on the module. Only certain modules have the clock source control in SIM. For these modules, SIM HAL driver provides the separate APIs to set or get module source. The module source setting values are defined in the enumeration with the prefix `clock_`. For example, USB FS OTG module uses the MCGPLLFLCLK or the external USB_CLKIN as a clock source. Therefore, the SIM HAL driver provides these for the USB FS OTG module clock source:

```
typedef enum _clock_usbfs_src
{
    kClockUsbfsSrcExt,           // External bypass clock (USB_CLKIN)           //
    kClockUsbfsSrcPllFlSel,     // MCGPLLFLCLK divided by USB divider         //
} clock_usbfs_src_t;

// Set USB FS OTG clock source. //
void CLOCK_HAL_SetUsbfsSrc(uint32_t baseAddr, uint8_t instance,
    clock_usbfs_src_t setting);

// Get USB FS OTG clock source. //
clock_usbfs_src_t CLOCK_HAL_GetUsbfsSrc(uint32_t baseAddr, uint8_t
    instance);
```

For other IP modules, the clock source selection register is in IP module, but the clock distribution is controlled by the system integration. Therefore, the SIM HAL driver provides the information for the IP

modules and IP drivers know which clock sources are available and how to set their internal register to select a different clock source. This information is provided as an enumeration, such as SAI module using SYSCLK, OSC0ERCLK, and MCGPLLCLK as a clock source. The SIM HAL driver provides:

```
typedef enum _clock_sai_src
{
    kClockSaiSrcSysClk    = 0U, // SYSCLK    //
    kClockSaiSrcOsc0erClk = 1U, // OSC0ERCLK //
    kClockSaiSrcPllClk    = 3U  // MCGPLLCLK //
} clock_sai_src_t;
```

See the appropriate reference manual for details.

66.2.4 Clock Divider access APIs

Certain clocks use dividers configured in SIM module. The SIM HAL driver provides API functions to get/set the divider values. For example:

```
// To set USB FS OTG divider. //
void CLOCK_HAL_SetUsbfsDiv(uint32_t baseAddr,
                           uint8_t usbdiv,
                           uint8_t usfrac);

// To get USB FS OTG divider setting. //
void CLOCK_HAL_GetUsbfsDiv(uint32_t baseAddr,
                            uint8_t *usbdiv,
                            uint8_t *usfrac);
```

*Sets the USB voltage regulator VLP standby write enable setting.*

  - static bool [SIM\\_HAL\\_GetUsbVoltRegulatorInStdbyDuringVlprwCmd](#) (SIM\_Type \*base)

*Gets the USB voltage regulator VLP standby write enable setting.*

  - static void [SIM\\_HAL\\_SetUsbVoltRegulatorWriteCmd](#) (SIM\_Type \*base, bool enable)

*Sets the USB voltage regulator enable write enable setting.*

  - static bool [SIM\\_HAL\\_GetUsbVoltRegulatorWriteCmd](#) (SIM\_Type \*base)

*Gets the USB voltage regulator enable write enable setting.*

  - static void [CLOCK\\_HAL\\_SetLpuartSrc](#) (SIM\_Type \*base, uint32\_t instance, clock\_lpuart\_src\_t setting)

*Set LPUART clock source.*

  - static clock\_lpuart\_src\_t [CLOCK\\_HAL\\_GetLpuartSrc](#) (SIM\_Type \*base, uint32\_t instance)

*Get LPUART clock source.*

  - static void [SIM\\_HAL\\_SetLpuartRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance, sim\_lpuart\_rxs\_src\_t select)

*Sets the LPUARTx receive data source select setting.*

  - static sim\_lpuart\_rxs\_src\_t [SIM\\_HAL\\_GetLpuartRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the LPUARTx receive data source select setting.*

  - static void [CLOCK\\_HAL\\_SetUsbhsSlowClockSrc](#) (SIM\_Type \*base, uint32\_t instance, clock\_usbhs\_slowclk\_src\_t setting)

*Set the selection of the clock source for the USB HS/USB PHY slow clock.*

  - static clock\_usbhs\_slowclk\_src\_t [CLOCK\\_HAL\\_GetUsbhsSlowClockSrc](#) (SIM\_Type \*base, uint32\_t instance)

*Get the selection of the clock source for the USB HS/USB PHY slow clock.*

  - void [CLOCK\\_HAL\\_SetPllfllDiv](#) (SIM\_Type \*base, uint8\_t pllflldiv, uint8\_t pllflfrac)

*Set PLL/FLL divider setting.*

  - void [CLOCK\\_HAL\\_GetPllfllDiv](#) (SIM\_Type \*base, uint8\_t \*pllflldiv, uint8\_t \*pllflfrac)

## SIM HAL driver

- Gets PLL/FLL divider setting.*

  - void [CLOCK\\_HAL\\_SetTraceDiv](#) (SIM\_Type \*base, uint8\_t tracediv, uint8\_t tracefrac)

*Set TRACECLK divider setting.*

  - void [CLOCK\\_HAL\\_GetTraceDiv](#) (SIM\_Type \*base, uint8\_t \*tracediv, uint8\_t \*tracefrac)

*Gets TRACECLK setting.*

  - static void [CLOCK\\_HAL\\_SetTpmSrc](#) (SIM\_Type \*base, uint32\_t instance, [clock\\_tpm\\_src\\_t](#) setting)

*Set the TPM clock source selection.*

  - static [clock\\_tpm\\_src\\_t](#) [CLOCK\\_HAL\\_GetTpmSrc](#) (SIM\_Type \*base, uint32\_t instance)

*Get the TPM clock source selection.*

  - static void [SIM\\_HAL\\_SetUsbVoltRegulatorInrushLimitCmd](#) (SIM\_Type \*base, bool enable)

*Sets the USB voltage regulator inrush current limit setting.*

  - static bool [SIM\\_HAL\\_GetUsbVoltRegulatorInrushLimitCmd](#) (SIM\_Type \*base)

*Gets the USB voltage regulator inrush current limit setting.*

  - static void [SIM\\_HAL\\_SetUsbVoltRegulatorOutputTargetCmd](#) (SIM\_Type \*base, [sim\\_usbvout\\_mode\\_t](#) target)

*Sets the USB voltage regulator output target.*

  - static [sim\\_usbvout\\_mode\\_t](#) [SIM\\_HAL\\_GetUsbVoltRegulatorOutputTargetCmd](#) (SIM\_Type \*base)

*Gets the USB voltage regulator output target.*

  - static void [SIM\\_HAL\\_SetUsbPhyPllRegulatorCmd](#) (SIM\_Type \*base, bool enable)

*Sets the USB PHY PLL regulator enabled setting.*

  - static bool [SIM\\_HAL\\_GetUsbPhyPllRegulatorCmd](#) (SIM\_Type \*base)

*Gets the USB PHY PLL regulator enabled setting.*

  - static void [SIM\\_HAL\\_SetLpuartTxSrcMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_lpuart\\_txsrc\\_t](#) select)

*Sets the LPUARTx transmit data source select setting.*

  - static [sim\\_lpuart\\_txsrc\\_t](#) [SIM\\_HAL\\_GetLpuartTxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the LPUARTx transmit data source select setting.*

  - static void [CLOCK\\_HAL\\_SetEmvsimSrc](#) (SIM\_Type \*base, uint32\_t instance, [clock\\_emvsim\\_src\\_t](#) setting)

*Set EMVSIM clock source.*

  - static [clock\\_emvsim\\_src\\_t](#) [CLOCK\\_HAL\\_GetEmvsimSrc](#) (SIM\_Type \*base, uint32\_t instance)

*Get EMVSIM clock source.*

  - static void [CLOCK\\_HAL\\_SetFlexioSrc](#) (SIM\_Type \*base, uint32\_t instance, [clock\\_flexio\\_src\\_t](#) setting)

*Select the clock source for FLEXIO.*

  - static [clock\\_flexio\\_src\\_t](#) [CLOCK\\_HAL\\_GetFlexioSrc](#) (SIM\_Type \*base, uint32\_t instance)

*Get the clock source of FLEXIO.*

  - static void [CLOCK\\_HAL\\_SetLpisciSrc](#) (SIM\_Type \*base, uint32\_t instance, [clock\\_lpisci\\_src\\_t](#) setting)

*Set the LPSCI clock source selection.*

  - static [clock\\_lpisci\\_src\\_t](#) [CLOCK\\_HAL\\_GetLpisciSrc](#) (SIM\_Type \*base, uint32\_t instance)

*Get the LPSCI clock source selection.*

  - static void [SIM\\_HAL\\_SetLpisciRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_lpisci\\_rxsrc\\_t](#) select)

*Sets the LPSCIx receive data source select setting.*

  - static [sim\\_lpisci\\_rxsrc\\_t](#) [SIM\\_HAL\\_GetLpisciRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the LPSCIx receive data source select setting.*

  - static void [SIM\\_HAL\\_SetLpisciTxSrcMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_lpisci\\_txsrc\\_t](#) select)

- Sets the LPSCIX transmit data source select setting.*

  - static [sim\\_lpsci\\_txsrc\\_t SIM\\_HAL\\_GetLpisciTxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the LPSCIX transmit data source select setting.*

  - static uint32\_t [SIM\\_HAL\\_GetSramSize](#) (SIM\_Type \*base)

*Gets the Kinetis SramSize in the System Device ID register (SIM\_SDID).*

  - static void [CLOCK\\_HAL\\_SetCopSrc](#) (SIM\_Type \*base, [clock\\_cop\\_src\\_t](#) setting)

*Set the clock selection of COP.*

  - static [clock\\_cop\\_src\\_t](#) [CLOCK\\_HAL\\_GetCopSrc](#) (SIM\_Type \*base)

*Get the clock selection of COP.*

  - static void [SIM\\_HAL\\_SetLpuartOpenDrainCmd](#) (SIM\_Type \*base, uint32\_t instance, bool enable)

*Sets the LPUARTx Open Drain Enable setting.*

  - static bool [SIM\\_HAL\\_GetLpuartOpenDrainCmd](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the LPUARTx Open Drain Enable setting.*

  - static void [SIM\\_HAL\\_SetTpmChSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t channel, [sim\\_tpm\\_ch\\_src\\_t](#) select)

*Sets the Timer/PWM x channel y input capture source select setting.*

  - static [sim\\_tpm\\_ch\\_src\\_t](#) [SIM\\_HAL\\_GetTpmChSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t channel)

*Gets the Timer/PWM x channel y input capture source select setting.*

  - void [SIM\\_HAL\\_SetTpmExternalClkPinSelMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_tpm\\_clk\\_sel\\_t](#) select)

*Sets the Timer/PWM x external clock pin select setting.*

  - [sim\\_tpm\\_clk\\_sel\\_t](#) [SIM\\_HAL\\_GetTpmExternalClkPinSelMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the Timer/PWM x external clock pin select setting.*

  - static void [SIM\\_HAL\\_SetUartOpenDrainCmd](#) (SIM\_Type \*base, uint32\_t instance, bool enable)

*Sets the UARTx Open Drain Enable setting.*

  - static bool [SIM\\_HAL\\_GetUartOpenDrainCmd](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the UARTx Open Drain Enable setting.*

  - static uint32\_t [SIM\\_HAL\\_GetSramSizeId](#) (SIM\_Type \*base)

*Gets the Kinetis SRAMSIZE ID in the System Device ID register (SIM\_SDID).*

  - static void [CLOCK\\_HAL\\_SetOutDiv5ENCmd](#) (SIM\_Type \*base, bool setting)

*Set OUTDIV5EN.*

  - static bool [CLOCK\\_HAL\\_GetOutDiv5ENCmd](#) (SIM\_Type \*base)

*Get OUTDIV5EN.*

  - static void [CLOCK\\_HAL\\_SetOutDiv5](#) (SIM\_Type \*base, uint8\_t setting)

*Set OUTDIV5.*

  - static uint8\_t [CLOCK\\_HAL\\_GetOutDiv5](#) (SIM\_Type \*base)

*Get OUTDIV5.*

  - void [CLOCK\\_HAL\\_SetAdcAltClkSrc](#) (SIM\_Type \*base, uint32\_t instance, [clock\\_adc\\_alt\\_src\\_t](#) adcAltSrcSel)

*Sets the ADC ALT clock source selection setting.*

  - [clock\\_adc\\_alt\\_src\\_t](#) [CLOCK\\_HAL\\_GetAdcAltClkSrc](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the ADC ALT clock source selection setting.*

  - void [SIM\\_HAL\\_SetAdcAlternativeTriggerMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_adc\\_altrtg\\_sel\\_t](#) select)

*Sets the ADCx alternate trigger select setting.*

  - [sim\\_adc\\_altrtg\\_sel\\_t](#) [SIM\\_HAL\\_GetAdcAlternativeTriggerMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the ADCx alternate trigger select setting.*

## SIM HAL driver

- void [SIM\\_HAL\\_SetAdcTriggerModeOneStep](#) (SIM\_Type \*base, uint32\_t instance, sim\_adc\_altrg\_sel\_t altTrigSel, sim\_adc\_pretrg\_sel\_t preTrigSel, sim\_adc\_trg\_sel\_t trigSel)  
*Sets the ADCx trigger select setting in one function.*
- void [SIM\\_HAL\\_SetWdogClkSrc](#) (SIM\_Type \*base, bool select)  
*WDOG Clock Select.*
- bool [SIM\\_HAL\\_GetWdogClkSrc](#) (SIM\_Type \*base)  
*Get WDOG Clock Src.*
- void [SIM\\_HAL\\_SetUartOpenDrainMode](#) (SIM\_Type \*base, uint32\_t instance, bool enable)  
*Sets the UARTx open drain enable setting.*
- bool [SIM\\_HAL\\_GetUartOpenDrainMode](#) (SIM\_Type \*base, uint32\_t instance)  
*Gets the UARTx open drain enable setting.*
- static void [CLOCK\\_HAL\\_SetFtmFixFreqClkSrc](#) (SIM\_Type \*base, clock\_ftm\_fixedfreq\_src\_t ftmFixedFreqSel)  
*Sets the FTM Fixed clock source selection setting.*
- static clock\_ftm\_fixedfreq\_src\_t [CLOCK\\_HAL\\_GetFtmFixFreqClkSrc](#) (SIM\_Type \*base)  
*Gets the FTM Fixed clock source selection setting.*
- static void [SIM\\_HAL\\_SetFtmCarrierFreqMode](#) (SIM\_Type \*base, uint32\_t instance, sim\_ftm\_ft\_carrier\_sel\_t select)  
*Sets the Carrier frequency selection for FTM0/2/3/4 output channel.*
- static sim\_ftm\_ft\_carrier\_sel\_t [SIM\\_HAL\\_GetFtmCarrierFreqMode](#) (SIM\_Type \*base, uint32\_t instance)  
*Gets the Carrier frequency selection for FTM0/2 output channel.*
- static uint32\_t [SIM\\_HAL\\_GetSubFamId](#) (SIM\_Type \*base)  
*Gets the Kinetis SbuFam ID in System Device ID register (SIM\_SDID).*
- static uint32\_t [SIM\\_HAL\\_GetFlashMaxAddrBlock](#) (SIM\_Type \*base)  
*Gets the Flash maximum address block in the Flash Configuration Register 1 (SIM\_FCFG).*
- static void [SIM\\_HAL\\_SetFtmCarrierFreqMode](#) (SIM\_Type \*base, sim\_ftm\_ft\_carrier\_sel\_t select)  
*Sets the Carrier frequency selection for FTM0/2 output channel.*
- static sim\_ftm\_ft\_carrier\_sel\_t [SIM\\_HAL\\_GetFtmCarrierFreqMode](#) (SIM\_Type \*base)  
*Gets the Carrier frequency selection for FTM0/2 output channel.*
- sim\_hal\_status\_t [CLOCK\\_HAL\\_SetSource](#) (SIM\_Type \*base, clock\_source\_names\_t clockSource, uint8\_t setting)  
*Sets the clock source setting.*
- sim\_hal\_status\_t [CLOCK\\_HAL\\_GetSource](#) (SIM\_Type \*base, clock\_source\_names\_t clockSource, uint8\_t \*setting)  
*Gets the clock source setting.*
- sim\_hal\_status\_t [CLOCK\\_HAL\\_SetDivider](#) (SIM\_Type \*base, clock\_divider\_names\_t clockDivider, uint32\_t setting)  
*Sets the clock divider setting.*

## IP related clock feature APIs

- void [CLOCK\\_HAL\\_SetOutDiv](#) (SIM\_Type \*base, uint8\_t outdiv1, uint8\_t outdiv2, uint8\_t outdiv3, uint8\_t outdiv4)  
*Sets the clock out dividers setting.*
- void [CLOCK\\_HAL\\_GetOutDiv](#) (SIM\_Type \*base, uint8\_t \*outdiv1, uint8\_t \*outdiv2, uint8\_t \*outdiv3, uint8\_t \*outdiv4)  
*Gets the clock out dividers setting.*
- void [SIM\\_HAL\\_SetAdcAlternativeTriggerCmd](#) (SIM\_Type \*base, uint32\_t instance, bool enable)

- Sets the ADCx alternate trigger enable setting.*

  - bool [SIM\\_HAL\\_GetAdcAlternativeTriggerCmd](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the ADCx alternate trigger enable setting.*

- void [SIM\\_HAL\\_SetAdcPreTriggerMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_adc\\_pretrg\\_sel\\_t](#) select)

*Sets the ADCx pre-trigger select setting.*

- [sim\\_adc\\_pretrg\\_sel\\_t](#) [SIM\\_HAL\\_GetAdcPreTriggerMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the ADCx pre-trigger select setting.*

- void [SIM\\_HAL\\_SetAdcTriggerMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_adc\\_trg\\_sel\\_t](#) select)

*Sets the ADCx trigger select setting.*

- [sim\\_adc\\_trg\\_sel\\_t](#) [SIM\\_HAL\\_GetAdcTriggerMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the ADCx trigger select setting.*

- void [SIM\\_HAL\\_SetAdcTriggerModeOneStep](#) (SIM\_Type \*base, uint32\_t instance, bool altTrigEn, [sim\\_adc\\_pretrg\\_sel\\_t](#) preTrigSel, [sim\\_adc\\_trg\\_sel\\_t](#) trigSel)

*Sets the ADCx trigger select setting in one function.*

- void [SIM\\_HAL\\_SetUartRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_uart\\_rxsrc\\_t](#) select)

*Sets the UARTx receive data source select setting.*

- [sim\\_uart\\_rxsrc\\_t](#) [SIM\\_HAL\\_GetUartRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the UARTx receive data source select setting.*

- void [SIM\\_HAL\\_SetUartTxSrcMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_uart\\_txsrc\\_t](#) select)

*Sets the UARTx transmit data source select setting.*

- [sim\\_uart\\_txsrc\\_t](#) [SIM\\_HAL\\_GetUartTxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)

*Gets the UARTx transmit data source select setting.*

## 66.2.5 Macro Definition Documentation

66.2.5.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

66.2.5.2 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

66.2.5.3 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

66.2.5.4 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

66.2.5.5 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.6 Enumeration Type Documentation

### 66.2.6.1 enum sim\_hal\_status\_t

Enumerator

- kSimHalSuccess* Success.
- kSimHalFail* Error occurs.

## SIM HAL driver

### 66.2.6.2 enum clock\_lptmr\_src\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

### 66.2.6.62 enum sim\_clock\_gate\_name\_t

## 66.2.7 Function Documentation

**66.2.7.1 static void SIM\_HAL\_EnableClock ( SIM\_Type \* *base*, sim\_clock\_gate\_name\_t *name* ) [inline], [static]**

This function enables the clock for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to enable.          |

**66.2.7.2 static void SIM\_HAL\_DisableClock ( SIM\_Type \* *base*, sim\_clock\_gate\_name\_t *name* ) [inline], [static]**

This function disables the clock for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

|             |                                |
|-------------|--------------------------------|
| <i>name</i> | Name of the module to disable. |
|-------------|--------------------------------|

**66.2.7.3 static bool SIM\_HAL\_GetGateCmd ( SIM\_Type \* *base*, sim\_clock\_gate\_name\_t *name* ) [inline], [static]**

This function will get the clock gate state for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to get.             |

Returns

state true - ungated(Enabled), false - gated (Disabled)

**66.2.7.4 static void CLOCK\_HAL\_SetExternalRefClock32kSrc ( SIM\_Type \* *base*, clock\_er32k\_src\_t *setting* ) [inline], [static]**

This function sets the clock selection of ERCLK32K.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.5 static clock\_er32k\_src\_t CLOCK\_HAL\_GetExternalRefClock32kSrc ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the clock selection of ERCLK32K.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

## SIM HAL driver

```
66.2.7.6 static void CLOCK_HAL_SetOsc32kOutSel (SIM_Type * base,
clock_osc32kout_sel_t setting) [inline], [static]
```

This function sets ERCLK32K output pin.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.7 static clock\_osc32kout\_sel\_t CLOCK\_HAL\_GetOsc32kOutSel ( SIM\_Type \* *base* ) [inline], [static]**

This function gets ERCLK32K output pin setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.7.8 static uint32\_t SIM\_HAL\_GetRamSize ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the RAM size. The field specifies the amount of system RAM available on the device.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

size RAM size on the device

**66.2.7.9 static void CLOCK\_HAL\_SetPllflSel ( SIM\_Type \* *base*, clock\_pllfl\_sel\_t *setting* ) [inline], [static]**

This function sets the selection of the high frequency clock for various peripheral clocking options

Parameters

---

## SIM HAL driver

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

### 66.2.7.10 `static clock_pllfl_sel_t CLOCK_HAL_GetPliflSel ( SIM_Type * base ) [inline], [static]`

This function gets the selection of the high frequency clock for various peripheral clocking options

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

### 66.2.7.11 `static void CLOCK_HAL_SetTraceClkSrc ( SIM_Type * base, clock_trace_src_t setting ) [inline], [static]`

This function sets debug trace clock selection.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

### 66.2.7.12 `static clock_trace_src_t CLOCK_HAL_GetTraceClkSrc ( SIM_Type * base ) [inline], [static]`

This function gets debug trace clock selection.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.7.13** `static void CLOCK_HAL_SetClkOutSel ( SIM_Type * base, clock_clkout_src_t setting ) [inline], [static]`

This function sets the selection of the clock to output on the CLKOUT pin.

## SIM HAL driver

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

### 66.2.7.14 **static clock\_clkout\_src\_t CLOCK\_HAL\_GetClkOutSel ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the selection of the clock to output on the CLKOUT pin.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

### 66.2.7.15 **static void CLOCK\_HAL\_SetOutDiv1 ( SIM\_Type \* *base*, uint8\_t *setting* ) [inline], [static]**

This function sets divide value OUTDIV1.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

### 66.2.7.16 **static uint8\_t CLOCK\_HAL\_GetOutDiv1 ( SIM\_Type \* *base* ) [inline], [static]**

This function gets divide value OUTDIV1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.7.17 static void CLOCK\_HAL\_SetOutDiv2 ( SIM\_Type \* *base*, uint8\_t *setting* ) [inline], [static]**

This function sets divide value OUTDIV2.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.18 static uint8\_t CLOCK\_HAL\_GetOutDiv2 ( SIM\_Type \* *base* ) [inline], [static]**

This function gets divide value OUTDIV2.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.7.19 static void CLOCK\_HAL\_SetOutDiv4 ( SIM\_Type \* *base*, uint8\_t *setting* ) [inline], [static]**

This function sets divide value OUTDIV4.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## SIM HAL driver

|                |                   |
|----------------|-------------------|
| <i>setting</i> | The value to set. |
|----------------|-------------------|

### 66.2.7.20 static uint8\_t CLOCK\_HAL\_GetOutDiv4 ( SIM\_Type \* *base* ) [inline], [static]

This function gets divide value OUTDIV4.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

### 66.2.7.21 void CLOCK\_HAL\_SetOutDiv ( SIM\_Type \* *base*, uint8\_t *outdiv1*, uint8\_t *outdiv2*, uint8\_t *outdiv3*, uint8\_t *outdiv4* )

This function sets the setting for all clock out dividers at the same time.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>outdiv1</i> | Outdivider1 setting                    |
| <i>outdiv2</i> | Outdivider2 setting                    |
| <i>outdiv3</i> | Outdivider3 setting                    |
| <i>outdiv4</i> | Outdivider4 setting                    |

This function sets the setting for all clock out dividers at the same time. See the reference manual for a supported clock divider and value range and the clock\_divider\_names\_t for clock out dividers.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>outdiv1</i> | Outdivider1 setting                    |
| <i>outdiv2</i> | Outdivider2 setting                    |

|                |                     |
|----------------|---------------------|
| <i>outdiv3</i> | Outdivider3 setting |
| <i>outdiv4</i> | Outdivider4 setting |

**66.2.7.22 void CLOCK\_HAL\_GetOutDiv ( SIM\_Type \* *base*, uint8\_t \* *outdiv1*, uint8\_t \* *outdiv2*, uint8\_t \* *outdiv3*, uint8\_t \* *outdiv4* )**

This function gets the setting for all clock out dividers at the same time.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>outdiv1</i> | Outdivider1 setting                    |
| <i>outdiv2</i> | Outdivider2 setting                    |
| <i>outdiv3</i> | Outdivider3 setting                    |
| <i>outdiv4</i> | Outdivider4 setting                    |

**66.2.7.23 void SIM\_HAL\_SetAdcAlternativeTriggerCmd ( SIM\_Type \* *base*, uint32\_t *instance*, bool *enable* ) [inline]**

Sets the USB voltage regulator enabled setting.

This function enables/disables the alternative conversion triggers for ADCx.

Parameters

|                 |                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                 |
| <i>instance</i> | device instance.                                                                                                                                                                       |
| <i>enable</i>   | Enable alternative conversion triggers for ADCx <ul style="list-style-type: none"> <li>• true: Select alternative conversion trigger.</li> <li>• false: Select PDB trigger.</li> </ul> |

This function controls whether the USB voltage regulator is enabled. This bit can only be written when the SOPT1CFG[URWE] bit is set.

Parameters

## SIM HAL driver

|               |                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                |
| <i>enable</i> | USB voltage regulator enable setting <ul style="list-style-type: none"> <li>• true: USB voltage regulator is enabled.</li> <li>• false: USB voltage regulator is disabled.</li> </ul> |

Sets the ADCx alternate trigger enable setting.

This function enables/disables the alternative conversion triggers for ADCx.

Parameters

|                 |                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                 |
| <i>instance</i> | device instance.                                                                                                                                                                       |
| <i>enable</i>   | Enable alternative conversion triggers for ADCx <ul style="list-style-type: none"> <li>• true: Select alternative conversion trigger.</li> <li>• false: Select PDB trigger.</li> </ul> |

### 66.2.7.24 `bool SIM_HAL_GetAdcAlternativeTriggerCmd ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the ADCx alternate trigger enable setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

enabled True if ADCx alternate trigger is enabled

### 66.2.7.25 `void SIM_HAL_SetAdcPreTriggerMode ( SIM_Type * base, uint32_t instance, sim_adc_pretrg_sel_t select ) [inline]`

This function selects the ADCx pre-trigger source when the alternative triggers are enabled through ADCxALTTTRGEN.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | pre-trigger select setting for ADCx    |

**66.2.7.26** `sim_adc_pretrg_sel_t SIM_HAL_GetAdcPreTriggerMode ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the ADCx pre-trigger select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select ADCx pre-trigger select setting

**66.2.7.27** `void SIM_HAL_SetAdcTriggerMode ( SIM_Type * base, uint32_t instance, sim_adc_trg_sel_t select ) [inline]`

This function selects the ADCx trigger source when alternative triggers are enabled through ADCxALT-TRGEN.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | trigger select setting for ADCx        |

**66.2.7.28** `sim_adc_trg_sel_t SIM_HAL_GetAdcTriggerMode ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the ADCx trigger select setting.

## SIM HAL driver

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

### Returns

ADCx trigger select setting

**66.2.7.29 void SIM\_HAL\_SetAdcTriggerModeOneStep ( SIM\_Type \* *base*, uint32\_t *instance*, bool *altTrigEn*, sim\_adc\_pretrg\_sel\_t *preTrigSel*, sim\_adc\_trg\_sel\_t *trigSel* )**

This function sets ADC alternate trigger, pre-trigger mode and trigger mode.

### Parameters

|                   |                                        |
|-------------------|----------------------------------------|
| <i>base</i>       | Base address for current SIM instance. |
| <i>instance</i>   | device instance.                       |
| <i>altTrigEn</i>  | Alternative trigger enable or not.     |
| <i>preTrigSel</i> | Pre-trigger mode.                      |
| <i>trigSel</i>    | Trigger mode.                          |

**66.2.7.30 void SIM\_HAL\_SetUartRxSrcMode ( SIM\_Type \* *base*, uint32\_t *instance*, sim\_uart\_rxsrc\_t *select* ) [inline]**

This function selects the source for the UARTx receive data.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | the source for the UARTx receive data  |

**66.2.7.31 sim\_uart\_rxsrc\_t SIM\_HAL\_GetUartRxSrcMode ( SIM\_Type \* *base*, uint32\_t *instance* ) [inline]**

This function gets the UARTx receive data source select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select UARTx receive data source select setting

**66.2.7.32 void SIM\_HAL\_SetUartTxSrcMode ( SIM\_Type \* *base*, uint32\_t *instance*, sim\_uart\_txsrc\_t *select* ) [inline]**

This function selects the source for the UARTx transmit data.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | the source for the UARTx transmit data |

**66.2.7.33 sim\_uart\_txsrc\_t SIM\_HAL\_GetUartTxSrcMode ( SIM\_Type \* *base*, uint32\_t *instance* ) [inline]**

This function gets the UARTx transmit data source select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select UARTx transmit data source select setting

**66.2.7.34 void SIM\_HAL\_SetFtmTriggerSrcMode ( SIM\_Type \* *base*, uint32\_t *instance*, uint8\_t *trigger*, sim\_ftm\_trg\_src\_t *select* )**

This function selects the source of FTMx hardware trigger y.

## SIM HAL driver

### Parameters

|                 |                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                |
| <i>instance</i> | device instance.                                                                                                                                                      |
| <i>trigger</i>  | hardware trigger y                                                                                                                                                    |
| <i>select</i>   | FlexTimer x hardware trigger y <ul style="list-style-type: none"> <li>• 0: Pre-trigger A selected for ADCx.</li> <li>• 1: Pre-trigger B selected for ADCx.</li> </ul> |

### 66.2.7.35 `sim_ftm_trg_src_t SIM_HAL_GetFtmTriggerSrcMode ( SIM_Type * base, uint32_t instance, uint8_t trigger )`

This function gets the FlexTimer x hardware trigger y source select setting.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>trigger</i>  | hardware trigger y                     |

### Returns

select FlexTimer x hardware trigger y source select setting

### 66.2.7.36 `void SIM_HAL_SetFtmExternalClkPinMode ( SIM_Type * base, uint32_t instance, sim_ftm_clk_sel_t select )`

This function selects the source of FTMx external clock pin select.

### Parameters

|                 |                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                          |
| <i>instance</i> | device instance.                                                                                                                                                                                |
| <i>select</i>   | FTMx external clock pin select <ul style="list-style-type: none"> <li>• 0: FTMx external clock driven by FTM CLKIN0 pin.</li> <li>• 1: FTMx external clock driven by FTM CLKIN1 pin.</li> </ul> |

**66.2.7.37** `sim_ftm_clk_sel_t` **SIM\_HAL\_GetFtmExternalClkPinMode** ( `SIM_Type * base`,  
`uint32_t instance` )

This function gets the FlexTimer x external clock pin select setting.

## SIM HAL driver

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

### Returns

select FlexTimer x external clock pin select setting

**66.2.7.38 void SIM\_HAL\_SetFtmChSrcMode ( SIM\_Type \* *base*, uint32\_t *instance*, uint8\_t *channel*, sim\_ftm\_ch\_src\_t *select* )**

This function selects the FlexTimer x channel y input capture source.

### Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.     |
| <i>instance</i> | device instance.                           |
| <i>channel</i>  | FlexTimer channel y                        |
| <i>select</i>   | FlexTimer x channel y input capture source |

**66.2.7.39 sim\_ftm\_ch\_src\_t SIM\_HAL\_GetFtmChSrcMode ( SIM\_Type \* *base*, uint32\_t *instance*, uint8\_t *channel* )**

This function gets the FlexTimer x channel y input capture source select setting.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>channel</i>  | FlexTimer channel y                    |

### Returns

select FlexTimer x channel y input capture source select setting

**66.2.7.40 void SIM\_HAL\_SetFtmFaultSelMode ( SIM\_Type \* *base*, uint32\_t *instance*, uint8\_t *fault*, sim\_ftm\_ft\_sel\_t *select* )**

This function sets the FlexTimer x fault y select setting.

## Parameters

|                 |                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                              |
| <i>instance</i> | device instance.                                                                                                                                                    |
| <i>fault</i>    | fault y                                                                                                                                                             |
| <i>select</i>   | FlexTimer x fault y select setting <ul style="list-style-type: none"> <li>• 0: FlexTimer x fault y select 0.</li> <li>• 1: FlexTimer x fault y select 1.</li> </ul> |

**66.2.7.41 `sim_ftm_ftl_sel_t SIM_HAL_GetFtmFaultSelMode ( SIM_Type * base, uint32_t instance, uint8_t fault )`**

This function gets the FlexTimer x fault y select setting.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>fault</i>    | fault y                                |

## Returns

select FlexTimer x fault y select setting

**66.2.7.42 `void SIM_HAL_SetFtmChOutSrcMode ( SIM_Type * base, uint32_t instance, uint8_t channel, sim_ftm_ch_out_src_t select )`**

This function selects the FlexTimer x channel y output source.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>channel</i>  | FlexTimer channel y                    |

## SIM HAL driver

|               |                                     |
|---------------|-------------------------------------|
| <i>select</i> | FlexTimer x channel y output source |
|---------------|-------------------------------------|

### 66.2.7.43 `sim_ftm_ch_out_src_t SIM_HAL_GetFtmChOutSrcMode ( SIM_Type * base, uint32_t instance, uint8_t channel )`

This function gets the FlexTimer x channel y output source select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>channel</i>  | FlexTimer channel y                    |

Returns

select FlexTimer x channel y output source select setting

### 66.2.7.44 `void SIM_HAL_SetFtmSyncCmd ( SIM_Type * base, uint32_t instance, bool sync )`

This function sets FlexTimer x hardware trigger 0 software synchronization. FTMxSYNCBIT.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>sync</i>     | Synchronize or not.                    |

### 66.2.7.45 `static bool SIM_HAL_GetFtmSyncCmd ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets FlexTimer x hardware trigger 0 software synchronization. FTMxSYNCBIT.

Parameters

---

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

The synchronization value.

**66.2.7.46 static uint32\_t SIM\_HAL\_GetFamilyId ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the Kinetis Family ID in the System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Family ID

**66.2.7.47 static uint32\_t SIM\_HAL\_GetSubFamilyId ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the Kinetis Sub-Family ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Sub-Family ID

**66.2.7.48 static uint32\_t SIM\_HAL\_GetSeriesId ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the Kinetis Series ID in System Device ID register.

## SIM HAL driver

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Series ID

**66.2.7.49** `static uint32_t SIM_HAL_GetRevId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Revision ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Revision ID

**66.2.7.50** `static uint32_t SIM_HAL_GetDieId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Die ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Die ID

**66.2.7.51** `static uint32_t SIM_HAL_GetFamId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis family identification in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis family identification

**66.2.7.52 static uint32\_t SIM\_HAL\_GetPinCntId ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the Kinetis Pincount ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Pincount ID

**66.2.7.53 static uint32\_t SIM\_HAL\_GetProgramFlashSize ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the program flash size in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

size Program flash Size

**66.2.7.54 static void SIM\_HAL\_SetFlashDoze ( SIM\_Type \* *base*, uint32\_t *setting* ) [inline], [static]**

This function sets the Flash Doze in the Flash Configuration Register 1.

## SIM HAL driver

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | Flash Doze setting                     |

**66.2.7.55** `static uint32_t SIM_HAL_GetFlashDoze ( SIM_Type * base ) [inline], [static]`

This function gets the Flash Doze in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting Flash Doze setting

**66.2.7.56** `static void SIM_HAL_SetFlashDisableCmd ( SIM_Type * base, bool disable ) [inline], [static]`

This function sets the Flash disable setting in the Flash Configuration Register 1.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>disable</i> | Flash disable setting                  |

**66.2.7.57** `static bool SIM_HAL_GetFlashDisableCmd ( SIM_Type * base ) [inline], [static]`

This function gets the Flash disable setting in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting Flash disable setting

**66.2.7.58** `static uint32_t SIM_HAL_GetFlashMaxAddrBlock0 ( SIM_Type * base )  
[inline], [static]`

This function gets the Flash maximum block 0 in Flash Configuration Register 2.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

address Flash maximum block 0 address

**66.2.7.59** `static void CLOCK_HAL_SetSdhcSrc ( SIM_Type * base, uint32_t instance,  
clock_sdhc_src_t setting ) [inline], [static]`

This function sets the SDHC clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |
| <i>setting</i>  | The value to set.                      |

**66.2.7.60** `static clock_sdhc_src_t CLOCK_HAL_GetSdhcSrc ( SIM_Type * base, uint32_t  
instance ) [inline], [static]`

This function gets the SDHC clock source selection.

Parameters

---

## SIM HAL driver

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

Returns

Current selection.

**66.2.7.61** `static void CLOCK_HAL_SetTimeSrc ( SIM_Type * base, uint32_t instance, clock_time_src_t setting ) [inline], [static]`

This function sets the ethernet timestamp clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |
| <i>setting</i>  | The value to set.                      |

**66.2.7.62** `static clock_time_src_t CLOCK_HAL_GetTimeSrc ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the ethernet timestamp clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

Returns

Current selection.

**66.2.7.63** `static void CLOCK_HAL_SetRmiiSrc ( SIM_Type * base, uint32_t instance, clock_rmii_src_t setting ) [inline], [static]`

This function sets the Ethernet RMII interface clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |
| <i>setting</i>  | The value to set.                      |

**66.2.7.64 static clock\_rmii\_src\_t CLOCK\_HAL\_GetRmiiSrc ( SIM\_Type \* *base*, uint32\_t *instance* ) [inline], [static]**

This function gets the Ethernet RMII interface clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

Returns

Current selection.

**66.2.7.65 static void CLOCK\_HAL\_SetRtcClkOutSel ( SIM\_Type \* *base*, clock\_rtcout\_src\_t *setting* ) [inline], [static]**

This function sets the selection of the clock to output on the RTC\_CLKOUT pin.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.66 static clock\_rtcout\_src\_t CLOCK\_HAL\_GetRtcClkOutSel ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the selection of the clock to output on the RTC\_CLKOUT pin.

Parameters

---

## SIM HAL driver

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.7.67 static void CLOCK\_HAL\_SetOutDiv3 ( SIM\_Type \* *base*, uint8\_t *setting* ) [inline], [static]**

This function sets divide value OUTDIV3.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.68 static uint8\_t CLOCK\_HAL\_GetOutDiv3 ( SIM\_Type \* *base* ) [inline], [static]**

This function gets divide value OUTDIV3.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.7.69 static void SIM\_HAL\_SetPtd7PadDriveStrengthMode ( SIM\_Type \* *base*, sim\_ptd7pad\_strengh\_t *setting* ) [inline], [static]**

This function controls the output drive strength of the PTD7 pin by selecting either one or two pads to drive it.

Parameters

---

|                |                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                                                                                       |
| <i>setting</i> | PTD7 pad drive strength setting <ul style="list-style-type: none"> <li>• 0: Single-pad drive strength for PTD7.</li> <li>• 1: Double pad drive strength for PTD7.</li> </ul> |

**66.2.7.70 static sim\_ptd7pad\_strenght\_t SIM\_HAL\_GetPtd7PadDriveStrengthMode ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the PTD7 pad drive strength setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting PTD7 pad drive strength setting

**66.2.7.71 static void SIM\_HAL\_SetFlexbusSecurityLevelMode ( SIM\_Type \* *base*, sim\_flexbus\_security\_level\_t *setting* ) [inline], [static]**

This function sets the FlexBus security level setting. If the security is enabled, this field affects which CPU operations can access the off-chip via the FlexBus and DDR controller interfaces. This field has no effect if the security is not enabled.

Parameters

|                |                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                                                                                                                                                                                                                                                         |
| <i>setting</i> | FlexBus security level setting <ul style="list-style-type: none"> <li>• 00: All off-chip accesses (op code and data) via the FlexBus and DDR controller are disallowed.</li> <li>• 10: Off-chip op code accesses are disallowed. Data accesses are allowed.</li> <li>• 11: Off-chip op code accesses and data accesses are allowed.</li> </ul> |

## SIM HAL driver

**66.2.7.72** `static sim_flexbus_security_level_t SIM_HAL_GetFlexbusSecurityLevelMode ( SIM_Type * base ) [inline], [static]`

This function gets the FlexBus security level setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting FlexBus security level setting

**66.2.7.73** `static uint32_t SIM_HAL_GetFlexnvmSize ( SIM_Type * base ) [inline], [static]`

This function gets the FlexNVM size in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

size FlexNVM Size

**66.2.7.74** `static uint32_t SIM_HAL_GetEepromSize ( SIM_Type * base ) [inline], [static]`

This function gets the EEPROM size in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

size EEPROM Size

**66.2.7.75** `static uint32_t SIM_HAL_GetFlexnvmPartition ( SIM_Type * base ) [inline], [static]`

This function gets the FlexNVM partition in the Flash Configuration Register1

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting FlexNVM partition setting

**66.2.7.76** `static uint32_t SIM_HAL_GetFlashMaxAddrBlock1 ( SIM_Type * base ) [inline], [static]`

This function gets the Flash maximum block 1 in Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

address Flash maximum block 0 address

**66.2.7.77** `static uint32_t SIM_HAL_GetProgramFlashCmd ( SIM_Type * base ) [inline], [static]`

This function gets the program flash maximum block 0 in Flash Configuration Register 1.

## SIM HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

status program flash status

**66.2.7.78 static bool SIM\_HAL\_GetSwapProgramFlash ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the Swap program flash flag in the Flash Configuration Register 2.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

status - Swap program flash flag(Active or Inactive)

**66.2.7.79 void CLOCK\_HAL\_SetUsbfsDiv ( SIM\_Type \* *base*, uint8\_t *usbdiv*, uint8\_t *usbfrac* )**

This function sets USB FS divider setting. Divider output clock = Divider input clock \* [ (USBFSFRAC+1) / (USBFSDIV+1) ]

### Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>usbdiv</i>  | Value of USBFSDIV.                     |
| <i>usbfrac</i> | Value of USBFSFRAC.                    |

**66.2.7.80 void CLOCK\_HAL\_GetUsbfsDiv ( SIM\_Type \* *base*, uint8\_t \* *usbdiv*, uint8\_t \* *usbfrac* )**

This function gets USB FS divider setting. Divider output clock = Divider input clock \* [ (USBFSFRAC+1) / (USBFSDIV+1) ]

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>usbdiv</i>  | Value of USBFSDIV.                     |
| <i>usbfrac</i> | Value of USBFSFRAC.                    |

**66.2.7.81 static void CLOCK\_HAL\_SetUsbfsSrc ( SIM\_Type \* *base*, uint32\_t *instance*, clock\_usbfs\_src\_t *setting* ) [inline], [static]**

This function sets the selection of the clock source for the USB FS 48 MHz clock.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |
| <i>setting</i>  | The value to set.                      |

**66.2.7.82 static clock\_usbfs\_src\_t CLOCK\_HAL\_GetUsbfsSrc ( SIM\_Type \* *base*, uint32\_t *instance* ) [inline], [static]**

This function gets the selection of the clock source for the USB FS 48 MHz clock.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

Returns

Current selection.

**66.2.7.83 static void SIM\_HAL\_SetUsbVoltRegulatorCmd ( SIM\_Type \* *base*, bool *enable* ) [inline], [static]**

This function controls whether the USB voltage regulator is enabled. This bit can only be written when the SOPT1CFG[URWE] bit is set.

## SIM HAL driver

### Parameters

|               |                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                |
| <i>enable</i> | USB voltage regulator enable setting <ul style="list-style-type: none"> <li>• true: USB voltage regulator is enabled.</li> <li>• false: USB voltage regulator is disabled.</li> </ul> |

### 66.2.7.84 static bool SIM\_HAL\_GetUsbVoltRegulatorCmd ( SIM\_Type \* *base* ) [inline], [static]

This function gets the USB voltage regulator enabled setting.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

enabled True if the USB voltage regulator is enabled.

### 66.2.7.85 static void SIM\_HAL\_SetUsbVoltRegulatorInStdbyDuringStopMode ( SIM\_Type \* *base*, sim\_usbstby\_mode\_t *setting* ) [inline], [static]

This function controls whether the USB voltage regulator is placed in a standby mode during Stop, VLPS, LLS, and VLLS modes. This bit can only be written when the SOPT1CFG[USSWE] bit is set.

### Parameters

|                |                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                                                                                                                                                                                 |
| <i>setting</i> | USB voltage regulator in standby mode setting <ul style="list-style-type: none"> <li>• 0: USB voltage regulator not in standby during Stop, VLPS, LLS and VLLS modes.</li> <li>• 1: USB voltage regulator in standby during Stop, VLPS, LLS and VLLS modes.</li> </ul> |

**66.2.7.86** `static sim_usbstby_mode_t SIM_HAL_GetUsbVoltRegulatorInStdbyDuringStopMode ( SIM_Type * base ) [inline], [static]`

This function gets the USB voltage regulator in a standby mode setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting USB voltage regulator in a standby mode setting

**66.2.7.87** `static void SIM_HAL_SetUsbVoltRegulatorInStdbyDuringVlprwMode ( SIM_Type * base, sim_usbvstby_mode_t setting ) [inline], [static]`

This function controls whether the USB voltage regulator is placed in a standby mode during the VLPR and the VLPW modes. This bit can only be written when the SOPT1CFG[UVSWE] bit is set.

Parameters

|                |                                                                                                                                                                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                                                                                                                                                           |
| <i>setting</i> | USB voltage regulator in standby mode setting <ul style="list-style-type: none"> <li>• 0: USB voltage regulator not in standby during VLPR and VLPW modes.</li> <li>• 1: USB voltage regulator in standby during VLPR and VLPW modes.</li> </ul> |

**66.2.7.88** `static sim_usbvstby_mode_t SIM_HAL_GetUsbVoltRegulatorInStdbyDuringVlprwMode ( SIM_Type * base ) [inline], [static]`

This function gets the USB voltage regulator in a standby mode during the VLPR or the VLPW.

Parameters

---

## SIM HAL driver

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting USB voltage regulator in a standby mode during the VLPR or the VLPW

### 66.2.7.89 **static void SIM\_HAL\_SetUsbVoltRegulatorInStdbyDuringStopCmd ( SIM\_Type \* *base*, bool *enable* ) [inline], [static]**

This function controls whether the USB voltage regulator stop standby write feature is enabled. Writing one to this bit allows the SOPT1[USBSSTBY] bit to be written. This register bit clears after a write to SOPT1[USBSSTBY].

Parameters

|               |                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                                 |
| <i>enable</i> | USB voltage regulator stop standby write enable setting <ul style="list-style-type: none"> <li>• true: SOPT1[USBSSTBY] can be written.</li> <li>• false: SOPT1[USBSSTBY] cannot be written.</li> </ul> |

### 66.2.7.90 **static bool SIM\_HAL\_GetUsbVoltRegulatorInStdbyDuringStopCmd ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the USB voltage regulator stop standby write enable setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

enabled True if the USB voltage regulator stop standby write is enabled.

### 66.2.7.91 **static void SIM\_HAL\_SetUsbVoltRegulatorInStdbyDuringVlprwCmd ( SIM\_Type \* *base*, bool *enable* ) [inline], [static]**

This function controls whether USB voltage regulator VLP standby write feature is enabled. Writing one to this bit allows the SOPT1[USBVSTBY] bit to be written. This register bit clears after a write to SOPT1[USBVSTBY].

## Parameters

|               |                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                                |
| <i>enable</i> | USB voltage regulator VLP standby write enable setting <ul style="list-style-type: none"> <li>• true: SOPT1[USBSSTBY] can be written.</li> <li>• false: SOPT1[USBSSTBY] cannot be written.</li> </ul> |

**66.2.7.92 static bool SIM\_HAL\_GetUsbVoltRegulatorInStdbyDuringVlprwCmd ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the USB voltage regulator VLP standby write enable setting.

## Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## Returns

enabled True if the USB voltage regulator VLP standby write is enabled.

**66.2.7.93 static void SIM\_HAL\_SetUsbVoltRegulatorWriteCmd ( SIM\_Type \* *base*, bool *enable* ) [inline], [static]**

This function controls whether the USB voltage regulator write enable feature is enabled. Writing one to this bit allows the SOPT1[USBREGEN] bit to be written. This register bit clears after a write to SOPT1[USBREGEN].

## Parameters

|               |                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                           |
| <i>enable</i> | USB voltage regulator enable write enable setting <ul style="list-style-type: none"> <li>• true: SOPT1[USBSSTBY] can be written.</li> <li>• false: SOPT1[USBSSTBY] cannot be written.</li> </ul> |

## SIM HAL driver

**66.2.7.94** `static bool SIM_HAL_GetUsbVoltRegulatorWriteCmd ( SIM_Type * base )  
[inline], [static]`

This function gets the USB voltage regulator enable write enable setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

enabled True if USB voltage regulator enable write is enabled.

**66.2.7.95** `static void CLOCK_HAL_SetLpuartSrc ( SIM_Type * base, uint32_t instance,  
clock_lpuart_src_t setting ) [inline], [static]`

Set the clock selection of LPUART.

This function sets lpuart clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | LPUART instance.                       |
| <i>setting</i>  | The value to set.                      |

This function sets the clock selection of LPUART.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | LPUART instance.                       |
| <i>setting</i>  | The value to set.                      |

**66.2.7.96** `static clock_lpuart_src_t CLOCK_HAL_GetLpuartSrc ( SIM_Type * base,  
uint32_t instance ) [inline], [static]`

Get the clock selection of LPUART.

This function gets lpuart clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | LPUART instance.                       |

Returns

Current selection.

This function gets the clock selection of LPUART.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | LPUART instance.                       |

Returns

Current selection.

**66.2.7.97** `static void SIM_HAL_SetLpuartRxSrcMode ( SIM_Type * base, uint32_t instance, sim_lpuart_rxsrc_t select ) [inline], [static]`

This function selects the source for the LPUARTx receive data.

Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>base</i>     | Base address for current SIM instance.  |
| <i>instance</i> | device instance.                        |
| <i>select</i>   | the source for the LPUARTx receive data |

This function selects the source for the LPUARTx receive data.

Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>base</i>     | Register base address of SIM.           |
| <i>instance</i> | LPUART instance.                        |
| <i>select</i>   | the source for the LPUARTx receive data |

## SIM HAL driver

**66.2.7.98** `static sim_lpuart_rxsrc_t SIM_HAL_GetLpuartRxSrcMode ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the LPUARTx receive data source select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select LPUARTx receive data source select setting

This function gets the LPUARTx receive data source select setting.

Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>base</i>     | Register base address of SIM. |
| <i>instance</i> | LPUART instance.              |

Returns

select UARTx receive data source select setting

**66.2.7.99** `static void CLOCK_HAL_SetUsbhsSlowClockSrc ( SIM_Type * base, uint32_t instance, clock_usbhs_slowclk_src_t setting ) [inline], [static]`

This function sets the selection of the clock source for the USB HS/USB PHY slow clock.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

|                |                   |
|----------------|-------------------|
| <i>setting</i> | The value to set. |
|----------------|-------------------|

**66.2.7.100** `static clock_usbhs_slowclk_src_t CLOCK_HAL_GetUsbhsSlowClockSrc ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the selection of the clock source for the USB HS/USB PHY slow clock.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

Returns

Current selection.

**66.2.7.101** `void CLOCK_HAL_SetPIIFIDiv ( SIM_Type * base, uint8_t pllflldiv, uint8_t pllflfrac )`

This function sets PLL/FLL divider setting. Divider output clock = Divider input clock \* [ (PLLFLLFRAC+1) / (PLLFLLDIV+1) ]

Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <i>base</i>      | Base address for current SIM instance. |
| <i>pllflldiv</i> | Value of PLLFLLDIV.                    |
| <i>pllflfrac</i> | Value of PLLFLLFRAC.                   |

**66.2.7.102** `void CLOCK_HAL_GetPIIFIDiv ( SIM_Type * base, uint8_t * pllflldiv, uint8_t * pllflfrac )`

This function gets PLL/FLL divider setting. Divider output clock = Divider input clock \* [ (PLLFLLFRAC+1) / (PLLFLLDIV+1) ]

Parameters

## SIM HAL driver

|                  |                                        |
|------------------|----------------------------------------|
| <i>base</i>      | Base address for current SIM instance. |
| <i>pllflldiv</i> | Value of PLLFLLDIV.                    |
| <i>pllflfrac</i> | Value of PLLFLLFRAC.                   |

### 66.2.7.103 void CLOCK\_HAL\_SetTraceDiv ( SIM\_Type \* *base*, uint8\_t *tracediv*, uint8\_t *tracefrac* )

This function sets TRACECLK divider setting. Divider output clock = Divider input clock \* [ (TRACEFRAC+1) / (TRACEDIV+1) ]

Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <i>base</i>      | Base address for current SIM instance. |
| <i>tracediv</i>  | Value of TRACEDIV.                     |
| <i>tracefrac</i> | Value of PLLFLLFRAC.                   |

### 66.2.7.104 void CLOCK\_HAL\_GetTraceDiv ( SIM\_Type \* *base*, uint8\_t \* *tracediv*, uint8\_t \* *tracefrac* )

This function gets TRACECLK divider setting. Divider output clock = Divider input clock \* [ (TRACEFRAC+1) / (TRACEDIV+1) ]

Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <i>base</i>      | Base address for current SIM instance. |
| <i>tracediv</i>  | Value of PLLFLLDIV.                    |
| <i>tracefrac</i> | Value of PLLFLLFRAC.                   |

### 66.2.7.105 static void CLOCK\_HAL\_SetTpmSrc ( SIM\_Type \* *base*, uint32\_t *instance*, clock\_tpm\_src\_t *setting* ) [inline], [static]

This function sets the TPM clock source selection.

Parameters

---

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |
| <i>setting</i>  | The value to set.                      |

**66.2.7.106 static clock\_tpm\_src\_t CLOCK\_HAL\_GetTpmSrc ( SIM\_Type \* *base*, uint32\_t *instance* ) [inline], [static]**

This function gets the TPM clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

Returns

Current selection.

**66.2.7.107 static void SIM\_HAL\_SetUsbVoltRegulatorInrushLimitCmd ( SIM\_Type \* *base*, bool *enable* ) [inline], [static]**

This function controls whether the USB voltage regulator inrush current limit is enabled.

Parameters

|               |                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                                                                       |
| <i>enable</i> | USB voltage regulator inrush limit enable setting <ul style="list-style-type: none"> <li>• true: USB voltage regulator inrush current limit is enabled.</li> <li>• false: USB voltage regulator inrush current limit is disabled.</li> </ul> |

**66.2.7.108 static bool SIM\_HAL\_GetUsbVoltRegulatorInrushLimitCmd ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the USB voltage regulator inrush current limit enabled setting.

## SIM HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

enabled True if the USB voltage regulator is enabled.

**66.2.7.109** `static void SIM_HAL_SetUsbVoltRegulatorOutputTargetCmd ( SIM_Type * base, sim_usbvout_mode_t target ) [inline], [static]`

This function controls the USB voltage regulator output voltage.

### Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>target</i> | USB voltage regulator output target    |

**66.2.7.110** `static sim_usbvout_mode_t SIM_HAL_GetUsbVoltRegulatorOutputTargetCmd ( SIM_Type * base ) [inline], [static]`

This function gets the USB voltage regulator output voltage.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

USB voltage regulator output target value.

**66.2.7.111** `static void SIM_HAL_SetUsbPhyPIIRegulatorCmd ( SIM_Type * base, bool enable ) [inline], [static]`

This function controls whether the PLL regulator in the USB PHY is enabled. The regulator must be enabled before enabling the PLL in the USB HS PHY.

## Parameters

|               |                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                |
| <i>enable</i> | USB PHY PLL regulator enable setting <ul style="list-style-type: none"> <li>• true: USB PHY PLL regulator is enabled.</li> <li>• false: USB PHY PLL regulator is disabled.</li> </ul> |

**66.2.7.112 static bool SIM\_HAL\_GetUsbPhyPllRegulatorCmd ( SIM\_Type \* *base* )  
[inline], [static]**

This function gets the USB PHY PLL regulator enabled setting.

## Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## Returns

enabled True if the USB PHY PLL regulator is enabled.

**66.2.7.113 static void SIM\_HAL\_SetLpuartTxSrcMode ( SIM\_Type \* *base*, uint32\_t  
*instance*, sim\_lpuart\_txsrc\_t *select* ) [inline], [static]**

This function selects the source for the LPUARTx transmit data.

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>base</i>     | Base address for current SIM instance.  |
| <i>instance</i> | device instance.                        |
| <i>select</i>   | the source for the LPUARTx receive data |

This function selects the source for the LPUARTx transmit data.

## Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>base</i>     | Register base address of SIM. |
| <i>instance</i> | LPUART instance.              |

## SIM HAL driver

|               |                                         |
|---------------|-----------------------------------------|
| <i>select</i> | the source for the UARTx transmit data. |
|---------------|-----------------------------------------|

This function selects the source for the LPUARTx transmit data.

Parameters

|                 |                                          |
|-----------------|------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.   |
| <i>instance</i> | device instance.                         |
| <i>select</i>   | the source for the LPUARTx transmit data |

### 66.2.7.114 `static sim_lpuart_rxsrc_t SIM_HAL_GetLpuartTxSrcMode ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the LPUARTx transmit data source select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select LPUARTx transmit data source select setting

This function gets the LPUARTx transmit data source select setting.

Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>base</i>     | Register base address of SIM. |
| <i>instance</i> | LPUART instance.              |

Returns

select UARTx transmit data source select setting.

### 66.2.7.115 `static void CLOCK_HAL_SetEmvsimSrc ( SIM_Type * base, uint32_t instance, clock_emvsim_src_t setting ) [inline], [static]`

This function sets emvsim clock source selection.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | EMVSIM instance.                       |
| <i>setting</i>  | The value to set.                      |

**66.2.7.116** `static clock_emvsim_src_t CLOCK_HAL_GetEmvsimSrc ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets emvsim clock source selection.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | EMVSIM instance.                       |

## Returns

Current selection.

**66.2.7.117** `static void CLOCK_HAL_SetFlexioSrc ( SIM_Type * base, uint32_t instance, clock_flexio_src_t setting ) [inline], [static]`

This function selects the clock source for FLEXIO.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |
| <i>setting</i>  | The value to set.                      |

**66.2.7.118** `static clock_flexio_src_t CLOCK_HAL_GetFlexioSrc ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the clock source of FLEXIO.

## SIM HAL driver

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

### Returns

Current selection.

**66.2.7.119** `static void CLOCK_HAL_SetLpisciSrc ( SIM_Type * base, uint32_t instance, clock_lpisci_src_t setting ) [inline], [static]`

This function sets the LPSCI clock source selection.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |
| <i>setting</i>  | The value to set.                      |

**66.2.7.120** `static clock_lpisci_src_t CLOCK_HAL_GetLpisciSrc ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the LPSCI clock source selection.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | IP instance.                           |

### Returns

Current selection.

**66.2.7.121** `static void SIM_HAL_SetLpisciRxSrcMode ( SIM_Type * base, uint32_t instance, sim_lpisci_rxsrc_t select ) [inline], [static]`

This function selects the source for the LPSCIX receive data.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | the source for the LPSCIX receive data |

**66.2.7.122** `static sim_lpisci_rxsrc_t SIM_HAL_GetLpisciRxSrcMode ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the LPSCIX receive data source select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select LPSCIX receive data source select setting

**66.2.7.123** `static void SIM_HAL_SetLpisciTxSrcMode ( SIM_Type * base, uint32_t instance, sim_lpisci_txsrc_t select ) [inline], [static]`

This function selects the source for the LPSCIX transmit data.

Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>base</i>     | Base address for current SIM instance.  |
| <i>instance</i> | device instance.                        |
| <i>select</i>   | the source for the LPSCIX transmit data |

**66.2.7.124** `static sim_lpisci_txsrc_t SIM_HAL_GetLpisciTxSrcMode ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the LPSCIX transmit data source select setting.

## SIM HAL driver

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

### Returns

select LPSCIx transmit data source select setting

**66.2.7.125** `static uint32_t SIM_HAL_GetSramSize ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis SramSize in System Device ID register.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

id Kinetis SramSize

**66.2.7.126** `static void CLOCK_HAL_SetCopSrc ( SIM_Type * base, clock_cop_src_t setting ) [inline], [static]`

This function sets the clock selection of COP.

### Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.127** `static clock_cop_src_t CLOCK_HAL_GetCopSrc ( SIM_Type * base ) [inline], [static]`

This function gets the clock selection of COP.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.7.128 void SIM\_HAL\_SetLpuartOpenDrainCmd ( SIM\_Type \* *base*, uint32\_t *instance*, bool *enable* ) [inline], [static]**

This function enables/disables the LPUARTx Open Drain.

Parameters

|                 |                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Register base address of SIM.                                                                                                                                      |
| <i>instance</i> | LPUART instance.                                                                                                                                                   |
| <i>enable</i>   | Enable/disable LPUARTx Open Drain <ul style="list-style-type: none"> <li>• True: Enable LPUARTx Open Drain</li> <li>• False: Disable LPUARTx Open Drain</li> </ul> |

**66.2.7.129 bool SIM\_HAL\_GetLpuartOpenDrainCmd ( SIM\_Type \* *base*, uint32\_t *instance* ) [inline], [static]**

This function gets the LPUARTx Open Drain Enable setting.

Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>base</i>     | Register base address of SIM. |
| <i>instance</i> | LPUART instance.              |

Returns

enabled True if LPUARTx Open Drain is enabled.

**66.2.7.130 void SIM\_HAL\_SetTpmChSrcMode ( SIM\_Type \* *base*, uint32\_t *instance*, uint8\_t *channel*, sim\_tpm\_ch\_src\_t *select* ) [inline], [static]**

This function selects the Timer/PWM x channel y input capture source.

## SIM HAL driver

### Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.     |
| <i>instance</i> | device instance.                           |
| <i>channel</i>  | TPM channel y                              |
| <i>select</i>   | Timer/PWM x channel y input capture source |

### 66.2.7.131 `sim_tpm_ch_src_t SIM_HAL_GetTpmChSrcMode ( SIM_Type * base, uint32_t instance, uint8_t channel ) [inline], [static]`

This function gets the Timer/PWM x channel y input capture source select setting.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>channel</i>  | Tpm channel y                          |

### Returns

select Timer/PWM x channel y input capture source select setting

### 66.2.7.132 `void SIM_HAL_SetTpmExternalClkPinSelMode ( SIM_Type * base, uint32_t instance, sim_tpm_clk_sel_t select )`

This function selects the source of the Timer/PWM x external clock pin select.

### Parameters

|                 |                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                                                       |
| <i>instance</i> | device instance.                                                                                                                                                                                                             |
| <i>select</i>   | Timer/PWM x external clock pin select <ul style="list-style-type: none"> <li>• 0: Timer/PWM x external clock driven by the TPM_CLKIN0 pin.</li> <li>• 1: Timer/PWM x external clock driven by the TPM_CLKIN1 pin.</li> </ul> |

**66.2.7.133** `sim_tpm_clk_sel_t SIM_HAL_GetTpmExternalClkPinSelMode ( SIM_Type * base, uint32_t instance )`

This function gets the Timer/PWM x external clock pin select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select Timer/PWM x external clock pin select setting

**66.2.7.134** `static void SIM_HAL_SetUartOpenDrainCmd ( SIM_Type * base, uint32_t instance, bool enable ) [inline], [static]`

This function enables/disables the UARTx Open Drain.

Parameters

|                 |                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Register base address of SIM.                                                                                                                                |
| <i>instance</i> | UART instance.                                                                                                                                               |
| <i>enable</i>   | Enable/disable UARTx Open Drain <ul style="list-style-type: none"> <li>• True: Enable UARTx Open Drain</li> <li>• False: Disable UARTx Open Drain</li> </ul> |

**66.2.7.135** `static bool SIM_HAL_GetUartOpenDrainCmd ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the UARTx Open Drain Enable setting.

Parameters

---

## SIM HAL driver

|                 |                               |
|-----------------|-------------------------------|
| <i>base</i>     | Register base address of SIM. |
| <i>instance</i> | UART instance.                |

Returns

enabled True if UARTx Open Drain is enabled.

**66.2.7.136** `static uint32_t SIM_HAL_GetSramSizeId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis SRAMSIZE ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis SRAMSIZE ID

**66.2.7.137** `static void CLOCK_HAL_SetOutDiv5ENCmd ( SIM_Type * base, bool setting ) [inline], [static]`

This function sets divide value OUTDIV5EN.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.138** `static bool CLOCK_HAL_GetOutDiv5ENCmd ( SIM_Type * base ) [inline], [static]`

This function gets divide value OUTDIV5EN.

Parameters

---

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.7.139** `static void CLOCK_HAL_SetOutDiv5 ( SIM_Type * base, uint8_t setting ) [inline], [static]`

This function sets divide value OUTDIV5.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.7.140** `static uint8_t CLOCK_HAL_GetOutDiv5 ( SIM_Type * base ) [inline], [static]`

This function gets divide value OUTDIV5.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.7.141** `void CLOCK_HAL_SetAdcAltClkSrc ( SIM_Type * base, uint32_t instance, clock_adc_alt_src_t adcAltSrcSel )`

This function sets the ADC ALT clock source selection setting.

Parameters

---

## SIM HAL driver

|                     |                                        |
|---------------------|----------------------------------------|
| <i>base</i>         | Base address for current SIM instance. |
| <i>instance</i>     | ADC module instance.                   |
| <i>adcAltSrcSel</i> | ADC ALT clock source.                  |

### 66.2.7.142 `clock_adc_alt_src_t` `CLOCK_HAL_GetAdcAltClkSrc ( SIM_Type * base, uint32_t instance )`

This function gets the ADC ALT clock source selection setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | ADC module instance.                   |

Returns

the ADC ALT clock source selection.

### 66.2.7.143 `void` `SIM_HAL_SetAdcAlternativeTriggerMode ( SIM_Type * base, uint32_t instance, sim_adc_altrg_sel_t select )`

This function selects the alternative conversion triggers for ADCx.

Parameters

|                 |                                          |
|-----------------|------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.   |
| <i>instance</i> | device instance.                         |
| <i>select</i>   | alternative conversion triggers for ADCx |

### 66.2.7.144 `sim_adc_altrg_sel_t` `SIM_HAL_GetAdcAlternativeTriggerMode ( SIM_Type * base, uint32_t instance )`

This function gets the ADCx alternate trigger select setting.

Parameters

---

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

selected ADCx alternate trigger select setting

**66.2.7.145 void SIM\_HAL\_SetAdcTriggerModeOneStep ( SIM\_Type \* *base*, uint32\_t *instance*, sim\_adc\_altrg\_sel\_t *altTrigSel*, sim\_adc\_pretrg\_sel\_t *preTrigSel*, sim\_adc\_trg\_sel\_t *trigSel* )**

This function sets ADC alternate trigger mode, pre-trigger mode and trigger mode.

Parameters

|                   |                                        |
|-------------------|----------------------------------------|
| <i>base</i>       | Base address for current SIM instance. |
| <i>instance</i>   | device instance.                       |
| <i>altTrigSel</i> | Alternative trigger mode.              |
| <i>preTrigSel</i> | Pre-trigger mode.                      |
| <i>trigSel</i>    | Trigger mode.                          |

**66.2.7.146 void SIM\_HAL\_SetWdogClkSrc ( SIM\_Type \* *base*, bool *select* )**

This function selects the clock source of the WDOG2008 watchdog.

Parameters

|               |                                                                                  |
|---------------|----------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                           |
| <i>select</i> | 0 Internal 1 kHz clock is source to WDOG2008<br>1 MCGIRCLK is source to WDOG2008 |

END

**66.2.7.147 bool SIM\_HAL\_GetWdogClkSrc ( SIM\_Type \* *base* )**

This function gets the clock source of the WDOG2008 watchdog.

## SIM HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

select: 0 Internal 1 kHz clock is source to WDOG2008 1 MCGIRCLK is source to WDOG2008

END

### 66.2.7.148 void SIM\_HAL\_SetUartOpenDrainMode ( SIM\_Type \* *base*, uint32\_t *instance*, bool *enable* )

This function enables/disables open drain for UARTx.

### Parameters

|                 |                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                 |
| <i>instance</i> | device instance.                                                                                                                                       |
| <i>enable</i>   | Enable open drain for UARTx <ul style="list-style-type: none"> <li>• true: Open drain is enabled.</li> <li>• false: Open drain is disabled.</li> </ul> |

### 66.2.7.149 bool SIM\_HAL\_GetUartOpenDrainMode ( SIM\_Type \* *base*, uint32\_t *instance* )

This function Gets the UARTx open drain enable setting for UARTx.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

### Returns

UARTx open drain setting

This function Gets the UARTx open drain enable setting for UARTx.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

## Returns

enabled True if UARTx Open Drain is enabled.

**66.2.7.150** `static void CLOCK_HAL_SetFtmFixFreqClkSrc ( SIM_Type * base,  
clock_ftm_fixedfreq_src_t ftmFixedFreqSel ) [inline], [static]`

This function sets the FTM Fixed clock source selection setting.

## Parameters

|                        |                                        |
|------------------------|----------------------------------------|
| <i>base</i>            | Base address for current SIM instance. |
| <i>ftmFixedFreqSel</i> | FTM Fixed clock source.                |

**66.2.7.151** `static clock_ftm_fixedfreq_src_t CLOCK_HAL_GetFtmFixFreqClkSrc ( SIM_Type * base ) [inline], [static]`

This function gets the FTM Fixed clock source selection setting.

## Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## Returns

the FTM Fixed clock source selection.

**66.2.7.152** `static void SIM_HAL_SetFtmCarrierFreqMode ( SIM_Type * base, uint32_t  
instance, sim_ftm_ftt_carrier_sel_t select ) [inline], [static]`

This function Sets the Carrier frequency selection for FTM0/2/3/4 output channel.

## SIM HAL driver

### Parameters

|                 |                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                                                                                                         |
| <i>instance</i> | device instance.                                                                                                                                                                                                                                                               |
| <i>select</i>   | Carrier frequency source select. <ul style="list-style-type: none"> <li>• 0 : FTM1_CH1 output provides the carrier signal</li> <li>• 1 : LPTMR0 pre-scaler output provides the carrier signal</li> <li>• 2 : FTM5_CH1 pre-scaler output provides the carrier signal</li> </ul> |

**66.2.7.153** `static sim_ftm_ftl_carrier_sel_t SIM_HAL_GetFtmCarrierFreqMode ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets Carrier frequency selection setting for FTM0/2 output channel.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

### Returns

Carrier frequency selection

**66.2.7.154** `static uint32_t SIM_HAL_GetSubFamId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis SubFam ID in System Device ID register.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

id Kinetis SubFam ID

**66.2.7.155** `static uint32_t SIM_HAL_GetFlashMaxAddrBlock ( SIM_Type * base ) [inline], [static]`

This function gets the Flash maximum block in Flash Configuration Register 2.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

address Flash maximum block address

**66.2.7.156** `static void SIM_HAL_SetFtmCarrierFreqMode ( SIM_Type * base,  
sim_ftm_ft_carrier_sel_t select ) [inline], [static]`

This function Sets the Carrier frequency selection for FTM0/2 output channel.

Parameters

|               |                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                                   |
| <i>select</i> | Carrier frequency source select. <ul style="list-style-type: none"> <li>• 0 : FTM1_CH1 output provides the carrier signal</li> <li>• 1 : LPTMR0 pre-scaler output provides the carrier signal</li> </ul> |

**66.2.7.157** `static sim_ftm_ft_carrier_sel_t SIM_HAL_GetFtmCarrierFreqMode ( SIM_Type  
* base ) [inline], [static]`

This function gets Carrier frequency selection setting for FTM0/2 output channel.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Carrier frequency selection

**66.2.7.158** `sim_hal_status_t CLOCK_HAL_SetSource ( SIM_Type * base,  
clock_source_names_t clockSource, uint8_t setting )`

This function sets the settings for a specified clock source. Each clock source has its own clock selection settings. See the chip reference manual for clock source detailed settings and the `clock_source_names_t` for clock sources.

## SIM HAL driver

### Parameters

|                    |                                                                    |
|--------------------|--------------------------------------------------------------------|
| <i>base</i>        | Base address for current SIM instance.                             |
| <i>clockSource</i> | Clock source name defined in <code>sim_clock_source_names_t</code> |
| <i>setting</i>     | Setting value                                                      |

### Returns

status If the clock source doesn't exist, it returns an error.

#### 66.2.7.159 `sim_hal_status_t` **CLOCK\_HAL\_GetSource** ( `SIM_Type` \* *base*, `clock_source_names_t` *clockSource*, `uint8_t` \* *setting* )

This function gets the settings for a specified clock source. Each clock source has its own clock selection settings. See the reference manual for clock source detailed settings and the `clock_source_names_t` for clock sources.

### Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| <i>base</i>        | Base address for current SIM instance. |
| <i>clockSource</i> | Clock source name                      |
| <i>setting</i>     | Current setting for the clock source   |

### Returns

status If the clock source doesn't exist, it returns an error.

#### 66.2.7.160 `sim_hal_status_t` **CLOCK\_HAL\_SetDivider** ( `SIM_Type` \* *base*, `clock_divider_names_t` *clockDivider*, `uint32_t` *setting* )

This function sets the setting for a specified clock divider. See the reference manual for a supported clock divider and value range and the `clock_divider_names_t` for dividers.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

|                     |                    |
|---------------------|--------------------|
| <i>clockDivider</i> | Clock divider name |
| <i>setting</i>      | Divider setting    |

Returns

status If the clock divider doesn't exist, it returns an error.

## SIM HAL driver

### 66.2.8 K02F12810 SIM HAL driver

#### 66.2.8.1 Overview

The section describes the enumerations, macros and data structures for K02F12810 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK02F12810.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k02f12810\\_t](#) {

66.2.8.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.8.3 Enumeration Type Documentation

#### 66.2.8.3.1 enum `clock_wdog_src_k02f12810_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

#### 66.2.8.3.2 enum `clock_trace_src_k02f12810_t`

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

### 66.2.8.3.3 enum clock\_port\_filter\_src\_k02f12810\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.8.3.4 enum clock\_lptmr\_src\_k02f12810\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.

### 66.2.8.3.5 enum clock\_pllfl\_sel\_k02f12810\_t

Enumerator

*kClockPlIFllSelFll* Fll clock.  
*kClockPlIFllSelIrc48M* IRC48MCLK.

### 66.2.8.3.6 enum clock\_er32k\_src\_k02f12810\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.8.3.7 enum clock\_clkout\_src\_k02f12810\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

## SIM HAL driver

### 66.2.8.3.8 enum clock\_osc32kout\_sel\_k02f12810\_t

Enumerator

- kClockOsc32koutNone* ERCLK32K is not output.
- kClockOsc32koutPte0* ERCLK32K is output on PTE0.
- kClockOsc32koutPte26* ERCLK32K is output on PTE26.

### 66.2.8.3.9 enum sim\_adc\_pretrg\_sel\_k02f12810\_t

Enumerator

- kSimAdcPretrgselA* Pre-trigger A selected for ADCx.
- kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

### 66.2.8.3.10 enum sim\_adc\_trg\_sel\_k02f12810\_t

Enumerator

- kSimAdcTrgselExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelPit0* PIT trigger 0.
- kSimAdcTrgSelPit1* PIT trigger 1.
- kSimAdcTrgSelPit2* PIT trigger 2.
- kSimAdcTrgSelPit3* PIT trigger 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.
- kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.8.3.11 enum sim\_uart\_rxsrc\_k02f12810\_t

Enumerator

- kSimUartRxsrcPin* UARTx\_RX Pin.
- kSimUartRxsrcCmp0* CMP0.
- kSimUartRxsrcCmp1* CMP1.

### 66.2.8.3.12 enum sim\_uart\_txsrc\_k02f12810\_t

Enumerator

- kSimUartTxsrcPin* UARTx\_TX Pin.

*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.

*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

#### 66.2.8.3.13 enum sim\_ftm\_trg\_src\_k02f12810\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.

*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

#### 66.2.8.3.14 enum sim\_ftm\_clk\_sel\_k02f12810\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.

*kSimFtmClkSel1* FTM CLKIN1 pin.

#### 66.2.8.3.15 enum sim\_ftm\_ch\_src\_k02f12810\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.

*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.

*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.

*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

#### 66.2.8.3.16 enum sim\_ftm\_ch\_out\_src\_k02f12810\_t

Enumerator

*kSimFtmChOutSrc0* FlexTimer x channel y output source selection 0.

*kSimFtmChOutSrc1* FlexTimer x channel y output source selection 1.

#### 66.2.8.3.17 enum sim\_ftmflt\_sel\_k02f12810\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.

*kSimFtmFltSel1* FlexTimer x fault y select 1.

## SIM HAL driver

### 66.2.8.3.18 enum sim\_tpm\_clk\_sel\_k02f12810\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.8.3.19 enum sim\_tpm\_ch\_src\_k02f12810\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.

*kSimTpmChSrc1* CMP0 output.

### 66.2.8.3.20 enum sim\_clock\_gate\_name\_k02f12810\_t

## 66.2.9 K10D10 SIM HAL driver

### 66.2.9.1 Overview

The section describes the enumerations, macros and data structures for K10D10 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK10D10.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k10d10\\_t](#) {  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*

### 66.2.9.2 Macro Definition Documentation

66.2.9.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.9.3 Enumeration Type Documentation

#### 66.2.9.3.1 enum `clock_wdog_src_k10d10_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for K10D10 it is Bus clock.

#### 66.2.9.3.2 enum `clock_trace_src_k10d10_t`

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

### 66.2.9.3.3 enum clock\_port\_filter\_src\_k10d10\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.9.3.4 enum clock\_lptmr\_src\_k10d10\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.9.3.5 enum clock\_time\_src\_k10d10\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.  
*kClockTimeSrcPllFllSel* clock as selected by SOPT2[PLLFLLSSEL].  
*kClockTimeSrcOsc0erClk* OSCERCLK clock.  
*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.9.3.6 enum clock\_rmii\_src\_k10d10\_t

Enumerator

*kClockRmiiSrcExtalClk* EXTAL Clock.  
*kClockRmiiSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.9.3.7 enum clock\_flexcan\_src\_k10d10\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

## SIM HAL driver

### 66.2.9.3.8 enum clock\_sdhc\_src\_k10d10\_t

Enumerator

- kClockSdhcSrcCoreSysClk* Core/system clock.
- kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLLSEL].
- kClockSdhcSrcOsc0erClk* OSCERCLK clock.
- kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.9.3.9 enum clock\_sai\_src\_k10d10\_t

Enumerator

- kClockSaiSrcSysClk* SYSCLK.
- kClockSaiSrcOsc0erClk* OSC0ERCLK.
- kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.9.3.10 enum clock\_tsi\_active\_mode\_src\_k10d10\_t

Enumerator

- kClockTsiActiveSrcBusClk* Bus clock.
- kClockTsiActiveSrcMcgIrClk* MCG IRC clock.
- kClockTsiActiveSrcOsc0erClk* OSCERCLK clock.

### 66.2.9.3.11 enum clock\_tsi\_lp\_mode\_src\_k10d10\_t

Enumerator

- kClockTsiLpSrcLpoClk* LPO clock.
- kClockTsiLpSrcEr32kClk* ERCLK32K clock.

### 66.2.9.3.12 enum clock\_pllfl\_sel\_k10d10\_t

Enumerator

- kClockPllFllSelFll* Fll clock.
- kClockPllFllSelPll* Pll0 clock.

### 66.2.9.3.13 enum clock\_er32k\_src\_k10d10\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.9.3.14 enum clock\_clkout\_src\_k10d10\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelRtc32kClk* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.9.3.15 enum clock\_rtcout\_src\_k10d10\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

### 66.2.9.3.16 enum sim\_adc\_pretrg\_sel\_k10d10\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.9.3.17 enum sim\_adc\_trg\_sel\_k10d10\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.

## SIM HAL driver

*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.9.3.18 enum sim\_uart\_rxsrc\_k10d10\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

### 66.2.9.3.19 enum sim\_uart\_txsrc\_k10d10\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.9.3.20 enum sim\_ftm\_trg\_src\_k10d10\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.9.3.21 enum sim\_ftm\_clk\_sel\_k10d10\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

### 66.2.9.3.22 enum sim\_ftm\_ch\_src\_k10d10\_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.9.3.23 enum sim\_ftmflt\_sel\_k10d10\_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

### 66.2.9.3.24 enum sim\_tpm\_clk\_sel\_k10d10\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.9.3.25 enum sim\_tpm\_ch\_src\_k10d10\_t

Enumerator

- kSimTpmChSrc0* TPMx\_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

### 66.2.9.3.26 enum sim\_cmtuartpad\_streng\_h\_k10d10\_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

### 66.2.9.3.27 enum sim\_ptd7pad\_streng\_h\_k10d10\_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

## SIM HAL driver

### 66.2.9.3.28 enum sim\_flexbus\_security\_level\_k10d10\_t

Enumerator

*kSimFbslLevel0* FlexBus security level 0.

*kSimFbslLevel1* FlexBus security level 1.

*kSimFbslLevel2* FlexBus security level 2.

*kSimFbslLevel3* FlexBus security level 3.

### 66.2.9.3.29 enum sim\_clock\_gate\_name\_k10d10\_t

## 66.2.10 K11DA50 SIM HAL driver

### 66.2.10.1 Overview

The section describes the enumerations, macros and data structures for K11DA50 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK11DA5.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)

### 66.2.10.2 Macro Definition Documentation

66.2.10.2.1 **#define FSL\_SIM\_SCGC\_BIT( SCGCx, n )** (((SCGCx-1U)<<5U) + n)

### 66.2.10.3 Enumeration Type Documentation

#### 66.2.10.3.1 enum clock\_trace\_src\_k11da5\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

#### 66.2.10.3.2 enum clock\_port\_filter\_src\_k11da5\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.

*kClockPortFilterSrcLpoClk* LPO.

#### 66.2.10.3.3 enum clock\_lptmr\_src\_k11da5\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

#### 66.2.10.3.4 enum clock\_time\_src\_k11da5\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.

*kClockTimeSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].

*kClockTimeSrcOsc0erClk* OSCERCLK clock.

*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

#### 66.2.10.3.5 enum clock\_usbfs\_src\_k11da5\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)

*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

**66.2.10.3.6 enum clock\_sai\_src\_k11da5\_t**

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

**66.2.10.3.7 enum clock\_pllfl\_sel\_k11da5\_t**

Enumerator

*kClockPllFlSelFl* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.

**66.2.10.3.8 enum clock\_er32k\_src\_k11da5\_t**

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

**66.2.10.3.9 enum clock\_clkout\_src\_k11da5\_t**

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelRtc32kClk* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

**66.2.10.3.10 enum clock\_rtcout\_src\_k11da5\_t**

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

## SIM HAL driver

### 66.2.10.3.11 enum sim\_usbsstby\_mode\_k11da5\_t

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes

*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.10.3.12 enum sim\_usbvstby\_mode\_k11da5\_t

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes

*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.10.3.13 enum sim\_adc\_pretrg\_sel\_k11da5\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.

*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.10.3.14 enum sim\_adc\_trg\_sel\_k11da5\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.

*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.

*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.

*kSimAdcTrgSelPit0* PIT trigger 0.

*kSimAdcTrgSelPit1* PIT trigger 1.

*kSimAdcTrgSelPit2* PIT trigger 2.

*kSimAdcTrgSelPit3* PIT trigger 3.

*kSimAdcTrgSelFtm0* FTM0 trigger.

*kSimAdcTrgSelFtm1* FTM1 trigger.

*kSimAdcTrgSelFtm2* FTM2 trigger.

*kSimAdcTrgSelRtcAlarm* RTC alarm.

*kSimAdcTrgSelRtcSec* RTC seconds.

*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.10.3.15 enum sim\_uart\_rxsrc\_k11da5\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.

*kSimUartRxsSrcCmp0* CMP0.

*kSimUartRxsSrcCmp1* CMP1.

#### 66.2.10.3.16 enum sim\_uart\_txsrc\_k11da5\_t

Enumerator

*kSimUartTxSrcPin* UARTx\_TX Pin.

*kSimUartTxSrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.

*kSimUartTxSrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

#### 66.2.10.3.17 enum sim\_ftm\_trg\_src\_k11d5\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.

*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

#### 66.2.10.3.18 enum sim\_ftm\_clk\_sel\_k11da5\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.

*kSimFtmClkSel1* FTM CLKIN1 pin.

#### 66.2.10.3.19 enum sim\_ftm\_ch\_src\_k11da5\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.

*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.

*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.

*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

#### 66.2.10.3.20 enum sim\_ftmflt\_sel\_k11da5\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.

*kSimFtmFltSel1* FlexTimer x fault y select 1.

## SIM HAL driver

### 66.2.10.3.21 enum sim\_tpm\_clk\_sel\_k11da5\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.10.3.22 enum sim\_tpm\_ch\_src\_k11da5\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.

*kSimTpmChSrc1* CMP0 output.

### 66.2.10.3.23 enum sim\_cmtuartpad\_strength\_k11da5\_t

Enumerator

*kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.

*kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

### 66.2.10.3.24 enum sim\_ptd7pad\_strength\_k11da5\_t

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.

*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### 66.2.10.3.25 enum sim\_clock\_gate\_name\_k11da5\_t

## 66.2.11 K20D10 SIM HAL driver

### 66.2.11.1 Overview

The section describes the enumerations, macros and data structures for K20D10 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK20D10.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k20d10\\_t](#) {  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_k20d10\\_t](#) {  
[kClockTraceSrcMcgoutClk](#),  
[kClockTraceSrcCoreClk](#) }  
*Debug trace clock source select.*
- enum [clock\\_port\\_filter\\_src\\_k20d10\\_t](#) {  
[kClockPortFilterSrcBusClk](#),  
[kClockPortFilterSrcLpoClk](#) }  
*PORTx digital input filter clock source select.*
- enum [clock\\_lptmr\\_src\\_k20d10\\_t](#) {  
[kClockLptmrSrcMcgIrClk](#),  
[kClockLptmrSrcLpoClk](#),  
[kClockLptmrSrcEr32kClk](#),  
[kClockLptmrSrcOsc0erClk](#) }  
*LPTMR clock source select.*
- enum [clock\\_time\\_src\\_k20d10\\_t](#) {  
[kClockTimeSrcCoreSysClk](#),  
[kClockTimeSrcPIIFilSel](#),  
[kClockTimeSrcOsc0erClk](#),  
[kClockTimeSrcExt](#) }  
*SIM timestamp clock source.*
- enum [clock\\_rmii\\_src\\_k20d10\\_t](#) {  
[kClockRmiiSrcExtalClk](#),  
[kClockRmiiSrcExt](#) }  
*SIM RMII clock source.*

## SIM HAL driver

### 66.2.11.2 Macro Definition Documentation

66.2.11.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.11.3 Enumeration Type Documentation

#### 66.2.11.3.1 enum `clock_wdog_src_k20d10_t`

Enumerator

- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for K20D10 it is Bus clock.

#### 66.2.11.3.2 enum `clock_trace_src_k20d10_t`

Enumerator

- `kClockTraceSrcMcgoutClk` MCG out clock.
- `kClockTraceSrcCoreClk` core clock

### 66.2.11.3.3 enum clock\_port\_filter\_src\_k20d10\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.11.3.4 enum clock\_lptmr\_src\_k20d10\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.11.3.5 enum clock\_time\_src\_k20d10\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.  
*kClockTimeSrcPllFllSel* clock as selected by SOPT2[PLLFLLSSEL].  
*kClockTimeSrcOsc0erClk* OSCERCLK clock.  
*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.11.3.6 enum clock\_rmii\_src\_k20d10\_t

Enumerator

*kClockRmiiSrcExtalClk* EXTAL Clock.  
*kClockRmiiSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.11.3.7 enum clock\_flexcan\_src\_k20d10\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

## SIM HAL driver

### 66.2.11.3.8 enum clock\_sdhc\_src\_k20d10\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLLSEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.11.3.9 enum clock\_sai\_src\_k20d10\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.11.3.10 enum clock\_tsi\_active\_mode\_src\_k20d10\_t

Enumerator

*kClockTsiActiveSrcBusClk* Bus clock.  
*kClockTsiActiveSrcMcgIrClk* MCG IRC clock.  
*kClockTsiActiveSrcOsc0erClk* OSCERCLK clock.

### 66.2.11.3.11 enum clock\_tsi\_lp\_mode\_src\_k20d10\_t

Enumerator

*kClockTsiLpSrcLpoClk* LPO clock.  
*kClockTsiLpSrcEr32kClk* ERCLK32K clock.

### 66.2.11.3.12 enum clock\_pllfl\_sel\_k20d10\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.

### 66.2.11.3.13 enum clock\_er32k\_src\_k20d10\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.11.3.14 enum clock\_clkout\_src\_k20d10\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelRtc32kClk* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.11.3.15 enum clock\_rtcout\_src\_k20d10\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

### 66.2.11.3.16 enum sim\_adc\_pretrg\_sel\_k20d10\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.11.3.17 enum sim\_adc\_trg\_sel\_k20d10\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.

## SIM HAL driver

*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.11.3.18 enum sim\_uart\_rxsrc\_k20d10\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

### 66.2.11.3.19 enum sim\_uart\_txsrc\_k20d10\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.11.3.20 enum sim\_ftm\_trg\_src\_k20d10\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.11.3.21 enum sim\_ftm\_clk\_sel\_k20d10\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

### 66.2.11.3.22 enum sim\_ftm\_ch\_src\_k20d10\_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.11.3.23 enum sim\_ftmflt\_sel\_k20d10\_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

### 66.2.11.3.24 enum sim\_tpm\_clk\_sel\_k20d10\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.11.3.25 enum sim\_tpm\_ch\_src\_k20d10\_t

Enumerator

- kSimTpmChSrc0* TPMx\_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

### 66.2.11.3.26 enum sim\_cmtuartpad\_streng\_h\_k20d10\_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

### 66.2.11.3.27 enum sim\_ptd7pad\_streng\_h\_k20d10\_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

## SIM HAL driver

### 66.2.11.3.28 enum sim\_flexbus\_security\_level\_k20d10\_t

Enumerator

*kSimFbslLevel0* FlexBus security level 0.

*kSimFbslLevel1* FlexBus security level 1.

*kSimFbslLevel2* FlexBus security level 2.

*kSimFbslLevel3* FlexBus security level 3.

### 66.2.11.3.29 enum sim\_clock\_gate\_name\_k20d10\_t

## 66.2.12 K21DA5 SIM HAL driver

### 66.2.12.1 Overview

The section describes the enumerations, macros and data structures for K21DA5 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK21DA5.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k21da5\\_t](#)  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_k21da5\\_t](#) {

## SIM HAL driver

### 66.2.12.2 Macro Definition Documentation

66.2.12.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.12.3 Enumeration Type Documentation

#### 66.2.12.3.1 enum clock\_trace\_src\_k21da5\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

#### 66.2.12.3.2 enum clock\_port\_filter\_src\_k21da5\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.

*kClockPortFilterSrcLpoClk* LPO.

#### 66.2.12.3.3 enum clock\_lptmr\_src\_k21da5\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

#### 66.2.12.3.4 enum clock\_time\_src\_k21da5\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.

*kClockTimeSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].

*kClockTimeSrcOsc0erClk* OSCERCLK clock.

*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

#### 66.2.12.3.5 enum clock\_usbfs\_src\_k21da5\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)

*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

### 66.2.12.3.6 enum clock\_sai\_src\_k21da5\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.12.3.7 enum clock\_pllfl\_sel\_k21da5\_t

Enumerator

*kClockPllFlSelFll* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.

### 66.2.12.3.8 enum clock\_er32k\_src\_k21da5\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.12.3.9 enum clock\_clkout\_src\_k21da5\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelRtc32kClk* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.12.3.10 enum clock\_rtcout\_src\_k21da5\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

## SIM HAL driver

### 66.2.12.3.11 enum sim\_usbsstby\_mode\_k21da5\_t

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes

*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.12.3.12 enum sim\_usbvstby\_mode\_k21da5\_t

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes

*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.12.3.13 enum sim\_adc\_pretrg\_sel\_k21da5\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.

*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.12.3.14 enum sim\_adc\_trg\_sel\_k21da5\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.

*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.

*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.

*kSimAdcTrgSelPit0* PIT trigger 0.

*kSimAdcTrgSelPit1* PIT trigger 1.

*kSimAdcTrgSelPit2* PIT trigger 2.

*kSimAdcTrgSelPit3* PIT trigger 3.

*kSimAdcTrgSelFtm0* FTM0 trigger.

*kSimAdcTrgSelFtm1* FTM1 trigger.

*kSimAdcTrgSelFtm2* FTM2 trigger.

*kSimAdcTrgSelRtcAlarm* RTC alarm.

*kSimAdcTrgSelRtcSec* RTC seconds.

*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.12.3.15 enum sim\_uart\_rxsrc\_k21da5\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.

*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

#### 66.2.12.3.16 enum sim\_uart\_txsrc\_k21da5\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

#### 66.2.12.3.17 enum sim\_ftm\_trg\_src\_k21da5\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

#### 66.2.12.3.18 enum sim\_ftm\_clk\_sel\_k21da5\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

#### 66.2.12.3.19 enum sim\_ftm\_ch\_src\_k21da5\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.  
*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.  
*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.  
*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

#### 66.2.12.3.20 enum sim\_ftmflt\_sel\_k21da5\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.  
*kSimFtmFltSel1* FlexTimer x fault y select 1.

## SIM HAL driver

### 66.2.12.3.21 enum sim\_tpm\_clk\_sel\_k21da5\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.12.3.22 enum sim\_tpm\_ch\_src\_k21da5\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.

*kSimTpmChSrc1* CMP0 output.

### 66.2.12.3.23 enum sim\_cmtuartpad\_streng\_h\_k21da5\_t

Enumerator

*kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.

*kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

### 66.2.12.3.24 enum sim\_ptd7pad\_streng\_h\_k21da5\_t

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.

*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### 66.2.12.3.25 enum sim\_clock\_gate\_name\_k21da5\_t

## 66.2.13 K21FA12 SIM HAL driver

### 66.2.13.1 Overview

The section describes the enumerations, macros and data structures for K21FA12 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK21FA12.h](#)

#### Macros

### 66.2.13.2 Macro Definition Documentation

66.2.13.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.13.3 Enumeration Type Documentation

#### 66.2.13.3.1 enum `clock_wdog_src_k21fa12_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for MK21FA12 it is Bus clock.

#### 66.2.13.3.2 enum `clock_trace_src_k21fa12_t`

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

### 66.2.13.3.3 enum clock\_port\_filter\_src\_k21fa12\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.

*kClockPortFilterSrcLpoClk* LPO.

### 66.2.13.3.4 enum clock\_lptmr\_src\_k21fa12\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.13.3.5 enum clock\_usbfs\_src\_k21fa12\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)

*kClockUsbfsSrcPIFUSel* Clock divider USB FS clock.

### 66.2.13.3.6 enum clock\_flexcan\_src\_k21fa12\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.

*kClockFlexcanSrcBusClk* Bus clock.

### 66.2.13.3.7 enum clock\_sdhc\_src\_k21fa12\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.

*kClockSdhcSrcPIFUSel* clock as selected by SOPT2[PLLFLSEL].

*kClockSdhcSrcOsc0erClk* OSCERCLK clock.

*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

## SIM HAL driver

### 66.2.13.3.8 enum clock\_sai\_src\_k21fa12\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.13.3.9 enum clock\_pllfl\_sel\_k21fa12\_t

Enumerator

*kClockPllFlSelFll* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.  
*kClockPllFlSelIrc48M* IRC48MCLK.

### 66.2.13.3.10 enum clock\_er32k\_src\_k21fa12\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.13.3.11 enum clock\_clkout\_src\_k21fa12\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.13.3.12 enum clock\_rtcout\_src\_k21fa12\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

**66.2.13.3.13 enum sim\_usbsstby\_mode\_k21fa12\_t**

## SIM HAL driver

### 66.2.14 K22F12810 SIM HAL driver

#### 66.2.14.1 Overview

The section describes the enumerations, macros and data structures for K22F12810 SIM HAL driver.

#### Macros

- #define `FSL_SIM_SCGC_BIT(SCGCx, n)` (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum `clock_wdog_src_k22f12810_t` {  
  `kClockWdogSrcLpoClk`,  
  `kClockWdogSrcAltClk` }  
*WDOG clock source select.*
- enum `clock_trace_src_k22f12810_t` {  
  `kClockTraceSrcMcgoutClk`,  
  `kClockTraceSrcCoreClk` }  
*Debug trace clock source select.*
- enum `clock_port_filter_src_k22f12810_t` {  
  `kClockPortFilterSrcBusClk`,  
  `kClockPortFilterSrcLpoClk` }  
*PORTx digital input filter clock source select.*
- enum `clock_lptmr_src_k22f12810_t` {  
  `kClockLptmrSrcMcgIrClk`,  
  `kClockLptmrSrcLpoClk`,  
  `kClockLptmrSrcEr32kClk`,  
  `kClockLptmrSrcOsc0erClkUndiv` }  
*LPTMR clock source select.*
- enum `clock_usbfs_src_k22f12810_t` {  
  `kClockUsbfsSrcExt`,  
  `kClockUsbfsSrcPllFllSel` }  
*SIM USB FS clock source.*
- enum `clock_lpuart_src_k22f12810_t` {  
  `kClockLpuartSrcNone`,  
  `kClockLpuartSrcPllFllSel`,  
  `kClockLpuartSrcOsc0erClk`,  
  `kClockLpuartSrcMcgIrClk` }  
*SIM LPUART clock source.*
- enum `clock_sai_src_k22f12810_t` {  
  `kClockSaiSrcSysClk` = 0U,  
  `kClockSaiSrcOsc0erClk` = 1U,  
  `kClockSaiSrcPllFllSel` = 3U }  
*SAI clock source.*

- enum `clock_pllfl1_sel_k22f12810_t` {  
`kClockPlIFl1SelFl1` = 0U,  
`kClockPlIFl1SelIrc48M` = 3U }  
*SIM PLLFLLSEL clock source select.*
- enum `clock_er32k_src_k22f12810_t` {  
`kClockEr32kSrcOsc0` = 0U,  
`kClockEr32kSrcRtc` = 2U,  
`kClockEr32kSrcLpo` = 3U }  
*SIM external reference clock source select (OSC32KSEL).*
- enum `clock_clkout_src_k22f12810_t` {  
`kClockClkoutSelFlashClk` = 2U,  
`kClockClkoutSelLpoClk` = 3U,  
`kClockClkoutSelMcgIrClk` = 4U,  
`kClockClkoutSelRtc` = 5U,  
`kClockClkoutSelOsc0erClk` = 6U,  
`kClockClkoutSelIrc48M` = 7U }  
*SIM CLKOUT\_SEL clock source select.*
- enum `clock_rtcout_src_k22f12810_t` {  
`kClockRtcoutSrc1Hz`,  
`kClockRtcoutSrc32kHz` }  
*SIM RTCCLKOUTSEL clock source select.*
- enum `clock_osc32kout_sel_k22f12810_t` {  
`kClockOsc32koutNone` = 0U,  
`kClockOsc32koutPte0` = 1U,  
`kClockOsc32koutPte26` = 2U }  
*SIM OSC32KOUT selection.*
- enum `sim_usbsstby_mode_k22f12810_t` {  
`kSimUsbsstbyNoRegulator`,  
`kSimUsbsstbyWithRegulator` }  
*SIM USB voltage regulator in standby mode setting during stop modes.*
- enum `sim_usbvstby_mode_k22f12810_t` {  
`kSimUsbvstbyNoRegulator`,  
`kSimUsbvstbyWithRegulator` }  
*SIM USB voltage regulator in standby mode setting during VLPR and VLPW modes.*
- enum `sim_adc_pretrg_sel_k22f12810_t` {  
`kSimAdcPretrgselA`,  
`kSimAdcPretrgselB` }  
*SIM ADCx pre-trigger select.*
- enum `sim_adc_trg_sel_k22f12810_t` {

## SIM HAL driver

- kSimAdcTrgSelExt = 0U,

## 66.2.14.2 Macro Definition Documentation

66.2.14.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.14.3 Enumeration Type Documentation

66.2.14.3.1 `enum clock_wdog_src_k22f12810_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

## SIM HAL driver

### 66.2.14.3.2 enum clock\_trace\_src\_k22f12810\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.  
*kClockTraceSrcCoreClk* core clock

### 66.2.14.3.3 enum clock\_port\_filter\_src\_k22f12810\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.14.3.4 enum clock\_lptmr\_src\_k22f12810\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.

### 66.2.14.3.5 enum clock\_usbfs\_src\_k22f12810\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

### 66.2.14.3.6 enum clock\_lpuart\_src\_k22f12810\_t

Enumerator

*kClockLpuartSrcNone* Clock disabled.  
*kClockLpuartSrcPllFllSel* Clock as selected by SOPT2[PLLFLSEL].  
*kClockLpuartSrcOsc0erClk* OSCERCLK.  
*kClockLpuartSrcMcgIrClk* MCGIRCLK.

### 66.2.14.3.7 enum clock\_sai\_src\_k22f12810\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllFlSel* MCGPLLCLK.

### 66.2.14.3.8 enum clock\_pllfl\_sel\_k22f12810\_t

Enumerator

*kClockPllFlSelFll* Fll clock.  
*kClockPllFlSelIrc48M* IRC48MCLK.

### 66.2.14.3.9 enum clock\_er32k\_src\_k22f12810\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.14.3.10 enum clock\_clkout\_src\_k22f12810\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.14.3.11 enum clock\_rtcout\_src\_k22f12810\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

## SIM HAL driver

### 66.2.14.3.12 enum clock\_osc32kout\_sel\_k22f12810\_t

Enumerator

- kClockOsc32koutNone* ERCLK32K is not output.
- kClockOsc32koutPte0* ERCLK32K is output on PTE0.
- kClockOsc32koutPte26* ERCLK32K is output on PTE26.

### 66.2.14.3.13 enum sim\_usbsstby\_mode\_k22f12810\_t

Enumerator

- kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes
- kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.14.3.14 enum sim\_usbvstby\_mode\_k22f12810\_t

Enumerator

- kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes
- kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.14.3.15 enum sim\_adc\_pretrg\_sel\_k22f12810\_t

Enumerator

- kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.
- kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.14.3.16 enum sim\_adc\_trg\_sel\_k22f12810\_t

Enumerator

- kSimAdcTrgSelExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelPit0* PIT trigger 0.
- kSimAdcTrgSelPit1* PIT trigger 1.
- kSimAdcTrgSelPit2* PIT trigger 2.
- kSimAdcTrgSelPit3* PIT trigger 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.

*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

#### 66.2.14.3.17 enum sim\_lpuart\_rxsrc\_k22f12810\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.  
*kSimLpuartRxsrcCmp1* CMP1.

#### 66.2.14.3.18 enum sim\_uart\_rxsrc\_k22f12810\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

#### 66.2.14.3.19 enum sim\_uart\_txsrc\_k22f12810\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

#### 66.2.14.3.20 enum sim\_ftm\_trg\_src\_k22f12810\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

#### 66.2.14.3.21 enum sim\_ftm\_clk\_sel\_k22f12810\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

## SIM HAL driver

### 66.2.14.3.22 enum sim\_ftm\_ch\_src\_k22f12810\_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.14.3.23 enum sim\_ftm\_ch\_out\_src\_k22f12810\_t

Enumerator

- kSimFtmChOutSrc0* FlexTimer x channel y output source selection 0.
- kSimFtmChOutSrc1* FlexTimer x channel y output source selection 1.

### 66.2.14.3.24 enum sim\_ftmflt\_sel\_k22f12810\_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

### 66.2.14.3.25 enum sim\_tpm\_clk\_sel\_k22f12810\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.14.3.26 enum sim\_tpm\_ch\_src\_k22f12810\_t

Enumerator

- kSimTpmChSrc0* TPMx\_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

### 66.2.14.3.27 enum sim\_cmtuartpad\_strenght\_k22f12810\_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

**66.2.14.3.28 enum sim\_ptd7pad\_strength\_k22f12810\_t**

## SIM HAL driver

### 66.2.15 K22F25612 SIM HAL driver

#### 66.2.15.1 Overview

The section describes the enumerations, macros and data structures for K22F25612 SIM HAL driver.

#### Macros

- #define `FSL_SIM_SCGC_BIT(SCGCx, n)` (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum `clock_wdog_src_k22f25612_t` {  
  `kClockWdogSrcLpoClk`,  
  `kClockWdogSrcAltClk` }  
*WDOG clock source select.*
- enum `clock_trace_src_k22f25612_t` {  
  `kClockTraceSrcMcgoutClk`,  
  `kClockTraceSrcCoreClk` }  
*Debug trace clock source select.*
- enum `clock_port_filter_src_k22f25612_t` {  
  `kClockPortFilterSrcBusClk`,  
  `kClockPortFilterSrcLpoClk` }  
*PORTx digital input filter clock source select.*
- enum `clock_lptmr_src_k22f25612_t` {  
  `kClockLptmrSrcMcgIrClk`,  
  `kClockLptmrSrcLpoClk`,  
  `kClockLptmrSrcEr32kClk`,  
  `kClockLptmrSrcOsc0erClkUndiv` }  
*LPTMR clock source select.*
- enum `clock_usbfs_src_k22f25612_t` {  
  `kClockUsbfsSrcExt`,  
  `kClockUsbfsSrcPllFllSel` }  
*SIM USB FS clock source.*
- enum `clock_lpuart_src_k22f25612_t` {  
  `kClockLpuartSrcNone`,  
  `kClockLpuartSrcPllFllSel`,  
  `kClockLpuartSrcOsc0erClk`,  
  `kClockLpuartSrcMcgIrClk` }  
*SIM LPUART clock source.*
- enum `clock_sai_src_k22f25612_t` {  
  `kClockSaiSrcSysClk` = 0U,  
  `kClockSaiSrcOsc0erClk` = 1U,  
  `kClockSaiSrcPllFllSel` = 3U }  
*SAI clock source.*

- enum `clock_pllfl1_sel_k22f25612_t` {  
`kClockPlIFllSelFll` = 0U,  
`kClockPlIFllSelPll` = 1U,  
`kClockPlIFllSelIrc48M` = 3U }  
*SIM PLLFLLSEL clock source select.*
- enum `clock_er32k_src_k22f25612_t` {  
`kClockEr32kSrcOsc0` = 0U,  
`kClockEr32kSrcRtc` = 2U,  
`kClockEr32kSrcLpo` = 3U }  
*SIM external reference clock source select (OSC32KSEL).*
- enum `clock_clkout_src_k22f25612_t` {  
`kClockClkoutSelFlashClk` = 2U,  
`kClockClkoutSelLpoClk` = 3U,  
`kClockClkoutSelMcgIrcClk` = 4U,  
`kClockClkoutSelRtc` = 5U,  
`kClockClkoutSelOsc0erClk` = 6U,  
`kClockClkoutSelIrc48M` = 7U }  
*SIM CLKOUT\_SEL clock source select.*
- enum `clock_rtcout_src_k22f25612_t` {  
`kClockRtcoutSrc1Hz`,  
`kClockRtcoutSrc32kHz` }  
*SIM RTCCLKOUTSEL clock source select.*
- enum `clock_osc32kout_sel_k22f25612_t` {  
`kClockOsc32koutNone` = 0U,  
`kClockOsc32koutPte0` = 1U,  
`kClockOsc32koutPte26` = 2U }  
*SIM OSC32KOUT selection.*
- enum `sim_usbsstby_mode_k22f25612_t` {  
`kSimUsbsstbyNoRegulator`,  
`kSimUsbsstbyWithRegulator` }  
*SIM USB voltage regulator in standby mode setting during stop modes.*
- enum `sim_usbvstby_mode_k22f25612_t` {  
`kSimUsbvstbyNoRegulator`,  
`kSimUsbvstbyWithRegulator` }  
*SIM USB voltage regulator in standby mode setting during VLPR and VLPW modes.*
- enum `sim_adc_pretrg_sel_k22f25612_t` {

*Clock gate name used for SIM\_HAL\_EnableClock/SIM\_HAL\_DisableClock.*

## 66.2.15.2 Macro Definition Documentation

66.2.15.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.15.3 Enumeration Type Documentation

66.2.15.3.1 `enum clock_wdog_src_k22f25612_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

## SIM HAL driver

### 66.2.15.3.2 enum clock\_trace\_src\_k22f25612\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.  
*kClockTraceSrcCoreClk* core clock

### 66.2.15.3.3 enum clock\_port\_filter\_src\_k22f25612\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.15.3.4 enum clock\_lptmr\_src\_k22f25612\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.

### 66.2.15.3.5 enum clock\_usbfs\_src\_k22f25612\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

### 66.2.15.3.6 enum clock\_lpuart\_src\_k22f25612\_t

Enumerator

*kClockLpuartSrcNone* Clock disabled.  
*kClockLpuartSrcPllFllSel* Clock as selected by SOPT2[PLLFLSEL].  
*kClockLpuartSrcOsc0erClk* OSCERCLK.  
*kClockLpuartSrcMcgIrClk* MCGIRCLK.

### 66.2.15.3.7 enum clock\_sai\_src\_k22f25612\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllFllSel* MCGPLLCLK.

### 66.2.15.3.8 enum clock\_pllfl\_sel\_k22f25612\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.  
*kClockPllFllSelIrc48M* IRC48MCLK.

### 66.2.15.3.9 enum clock\_er32k\_src\_k22f25612\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.15.3.10 enum clock\_clkout\_src\_k22f25612\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.15.3.11 enum clock\_rtcout\_src\_k22f25612\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

## SIM HAL driver

### 66.2.15.3.12 enum clock\_osc32kout\_sel\_k22f25612\_t

Enumerator

- kClockOsc32koutNone* ERCLK32K is not output.
- kClockOsc32koutPte0* ERCLK32K is output on PTE0.
- kClockOsc32koutPte26* ERCLK32K is output on PTE26.

### 66.2.15.3.13 enum sim\_usbsstby\_mode\_k22f25612\_t

Enumerator

- kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes
- kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.15.3.14 enum sim\_usbvstby\_mode\_k22f25612\_t

Enumerator

- kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes
- kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.15.3.15 enum sim\_adc\_pretrg\_sel\_k22f25612\_t

Enumerator

- kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.
- kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.15.3.16 enum sim\_adc\_trg\_sel\_k22f25612\_t

Enumerator

- kSimAdcTrgSelExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelPit0* PIT trigger 0.
- kSimAdcTrgSelPit1* PIT trigger 1.
- kSimAdcTrgSelPit2* PIT trigger 2.
- kSimAdcTrgSelPit3* PIT trigger 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.

*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

#### 66.2.15.3.17 enum sim\_lpuart\_rxsrc\_k22f25612\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.  
*kSimLpuartRxsrcCmp1* CMP1.

#### 66.2.15.3.18 enum sim\_uart\_rxsrc\_k22f25612\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

#### 66.2.15.3.19 enum sim\_uart\_txsrc\_k22f25612\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

#### 66.2.15.3.20 enum sim\_ftm\_trg\_src\_k22f25612\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

#### 66.2.15.3.21 enum sim\_ftm\_clk\_sel\_k22f25612\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

## SIM HAL driver

### 66.2.15.3.22 enum sim\_ftm\_ch\_src\_k22f25612\_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.15.3.23 enum sim\_ftm\_ch\_out\_src\_k22f25612\_t

Enumerator

- kSimFtmChOutSrc0* FlexTimer x channel y output source selection 0.
- kSimFtmChOutSrc1* FlexTimer x channel y output source selection 1.

### 66.2.15.3.24 enum sim\_ftmflt\_sel\_k22f25612\_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

### 66.2.15.3.25 enum sim\_tpm\_clk\_sel\_k22f25612\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.15.3.26 enum sim\_tpm\_ch\_src\_k22f25612\_t

Enumerator

- kSimTpmChSrc0* TPMx\_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

### 66.2.15.3.27 enum sim\_cmtuartpad\_strength\_k22f25612\_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

**66.2.15.3.28 enum sim\_ptd7pad\_strength\_k22f25612\_t**

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.**66.2.15.3.29 enum sim\_flexbus\_security\_level\_k22f25612\_t**

Enumerator

*kSimFbslLevel0* FlexBus security level 0.*kSimFbslLevel1* FlexBus security level 1.*kSimFbslLevel2* FlexBus security level 2.*kSimFbslLevel3* FlexBus security level 3.**66.2.15.3.30 enum sim\_clock\_gate\_name\_k22f25612\_t**

## SIM HAL driver

### 66.2.16 K22F51212 SIM HAL driver

#### 66.2.16.1 Overview

The section describes the enumerations, macros and data structures for K22F51212 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK22F51212.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)

## 66.2.16.2 Macro Definition Documentation

66.2.16.2.1 #define FSL\_SIM\_SCGC\_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)

## 66.2.16.3 Enumeration Type Documentation

66.2.16.3.1 enum clock\_wdog\_src\_k22f51212\_t

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

## SIM HAL driver

### 66.2.16.3.2 enum clock\_trace\_src\_k22f51212\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.  
*kClockTraceSrcCoreClk* core clock

### 66.2.16.3.3 enum clock\_port\_filter\_src\_k22f51212\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.16.3.4 enum clock\_lptmr\_src\_k22f51212\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.

### 66.2.16.3.5 enum clock\_usbfs\_src\_k22f51212\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

### 66.2.16.3.6 enum clock\_lpuart\_src\_k22f51212\_t

Enumerator

*kClockLpuartSrcNone* Clock disabled.  
*kClockLpuartSrcPllFllSel* Clock as selected by SOPT2[PLLFLSEL].  
*kClockLpuartSrcOsc0erClk* OSCERCLK.  
*kClockLpuartSrcMcgIrClk* MCGIRCLK.

### 66.2.16.3.7 enum clock\_sai\_src\_k22f51212\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllFllSel* MCGPLLFLCLK.

### 66.2.16.3.8 enum clock\_pllfl\_sel\_k22f51212\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.  
*kClockPllFllSelIrc48M* IRC48MCLK.

### 66.2.16.3.9 enum clock\_er32k\_src\_k22f51212\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.16.3.10 enum clock\_clkout\_src\_k22f51212\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.16.3.11 enum clock\_rtcout\_src\_k22f51212\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

## SIM HAL driver

### 66.2.16.3.12 enum clock\_osc32kout\_sel\_k22f51212\_t

Enumerator

- kClockOsc32koutNone* ERCLK32K is not output.
- kClockOsc32koutPte0* ERCLK32K is output on PTE0.
- kClockOsc32koutPte26* ERCLK32K is output on PTE26.

### 66.2.16.3.13 enum sim\_usbsstby\_mode\_k22f51212\_t

Enumerator

- kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes
- kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.16.3.14 enum sim\_usbvstby\_mode\_k22f51212\_t

Enumerator

- kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes
- kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.16.3.15 enum sim\_adc\_pretrg\_sel\_k22f51212\_t

Enumerator

- kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.
- kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.16.3.16 enum sim\_adc\_trg\_sel\_k22f51212\_t

Enumerator

- kSimAdcTrgSelExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelPit0* PIT trigger 0.
- kSimAdcTrgSelPit1* PIT trigger 1.
- kSimAdcTrgSelPit2* PIT trigger 2.
- kSimAdcTrgSelPit3* PIT trigger 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.

*kSimAdcTrgSelFtm3* FTM3 trigger.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

#### 66.2.16.3.17 enum sim\_lpuart\_rxsrc\_k22f51212\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.  
*kSimLpuartRxsrcCmp1* CMP1.

#### 66.2.16.3.18 enum sim\_uart\_rxsrc\_k22f51212\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

#### 66.2.16.3.19 enum sim\_uart\_txsrc\_k22f51212\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

#### 66.2.16.3.20 enum sim\_ftm\_trg\_src\_k22f51212\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

#### 66.2.16.3.21 enum sim\_ftm\_clk\_sel\_k22f51212\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

## SIM HAL driver

### 66.2.16.3.22 enum sim\_ftm\_ch\_src\_k22f51212\_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.16.3.23 enum sim\_ftm\_ch\_out\_src\_k22f51212\_t

Enumerator

- kSimFtmChOutSrc0* FlexTimer x channel y output source 0.
- kSimFtmChOutSrc1* FlexTimer x channel y output source 1.

### 66.2.16.3.24 enum sim\_ftmflt\_sel\_k22f51212\_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

### 66.2.16.3.25 enum sim\_tpm\_clk\_sel\_k22f51212\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.16.3.26 enum sim\_tpm\_ch\_src\_k22f51212\_t

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

### 66.2.16.3.27 enum sim\_cmtuartpad\_strength\_k22f51212\_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

**66.2.16.3.28 enum sim\_ptd7pad\_strength\_k22f51212\_t**

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.**66.2.16.3.29 enum sim\_flexbus\_security\_level\_k22f51212\_t**

Enumerator

*kSimFbslLevel0* FlexBus security level 0.*kSimFbslLevel1* FlexBus security level 1.*kSimFbslLevel2* FlexBus security level 2.*kSimFbslLevel3* FlexBus security level 3.**66.2.16.3.30 enum sim\_clock\_gate\_name\_k22f51212\_t**

## SIM HAL driver

### 66.2.17 K22FA12 SIM HAL driver

#### 66.2.17.1 Overview

The section describes the enumerations, macros and data structures for K22FA12 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK22FA12.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k22fa12\\_t](#) {  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_k22fa12\\_t](#) {

## 66.2.17.2 Macro Definition Documentation

66.2.17.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.17.3 Enumeration Type Documentation

### 66.2.17.3.1 enum `clock_wdog_src_k22fa12_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for MK22FA12 it is Bus clock.

### 66.2.17.3.2 enum `clock_trace_src_k22fa12_t`

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

## SIM HAL driver

### 66.2.17.3.3 enum clock\_port\_filter\_src\_k22fa12\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.17.3.4 enum clock\_lptmr\_src\_k22fa12\_t

Enumerator

*kClockLptmrSrcMcgrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.17.3.5 enum clock\_usbfs\_src\_k22fa12\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPIFUSel* Clock divider USB FS clock.

### 66.2.17.3.6 enum clock\_flexcan\_src\_k22fa12\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

### 66.2.17.3.7 enum clock\_sdhc\_src\_k22fa12\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPIFUSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.17.3.8 enum clock\_sai\_src\_k22fa12\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.17.3.9 enum clock\_pllfl\_sel\_k22fa12\_t

Enumerator

*kClockPllFlSelFll* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.  
*kClockPllFlSelIrc48M* IRC48MCLK.

### 66.2.17.3.10 enum clock\_er32k\_src\_k22fa12\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.17.3.11 enum clock\_clkout\_src\_k22fa12\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.17.3.12 enum clock\_rtcout\_src\_k22fa12\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

## SIM HAL driver

### 66.2.17.3.13 enum sim\_usbsstby\_mode\_k22fa12\_t

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes

*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.17.3.14 enum sim\_usbvstby\_mode\_k22fa12\_t

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes

*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.17.3.15 enum sim\_adc\_pretrg\_sel\_k22fa12\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.

*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.17.3.16 enum sim\_adc\_trg\_sel\_k22fa12\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.

*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.

*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.

*kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.

*kSimAdcTrgSelPit0* PIT trigger 0.

*kSimAdcTrgSelPit1* PIT trigger 1.

*kSimAdcTrgSelPit2* PIT trigger 2.

*kSimAdcTrgSelPit3* PIT trigger 3.

*kSimAdcTrgSelFtm0* FTM0 trigger.

*kSimAdcTrgSelFtm1* FTM1 trigger.

*kSimAdcTrgSelFtm2* FTM2 trigger.

*kSimAdcTrgSelFtm3* FTM3 trigger.

*kSimAdcTrgSelRtcAlarm* RTC alarm.

*kSimAdcTrgSelRtcSec* RTC seconds.

*kSimAdcTrgSelLptimer* Low-power timer trigger.

**66.2.17.3.17 enum sim\_uart\_rxsrc\_k22fa12\_t**

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

**66.2.17.3.18 enum sim\_uart\_txsrc\_k22fa12\_t**

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

**66.2.17.3.19 enum sim\_ftm\_trg\_src\_k22fa12\_t**

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

**66.2.17.3.20 enum sim\_ftm\_clk\_sel\_k22fa12\_t**

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

**66.2.17.3.21 enum sim\_ftm\_ch\_src\_k22fa12\_t**

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.  
*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.  
*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.  
*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

**66.2.17.3.22 enum sim\_ftmflt\_sel\_k22fa12\_t**

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.  
*kSimFtmFltSel1* FlexTimer x fault y select 1.

## SIM HAL driver

### 66.2.17.3.23 enum sim\_tpm\_clk\_sel\_k22fa12\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.17.3.24 enum sim\_tpm\_ch\_src\_k22fa12\_t

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

### 66.2.17.3.25 enum sim\_cmtuartpad\_strength\_k22fa12\_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

### 66.2.17.3.26 enum sim\_ptd7pad\_strength\_k22fa12\_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### 66.2.17.3.27 enum sim\_flexbus\_security\_level\_k22fa12\_t

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

### 66.2.17.3.28 enum sim\_clock\_gate\_name\_k22fa12\_t

## 66.2.18 K24F12 SIM HAL driver

### 66.2.18.1 Overview

The section describes the enumerations, macros and data structures for K24F12 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK24F12.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k24f12\\_t](#) {  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_k24f12\\_t](#) {  
[kClockTraceSrcMcgoutClk](#),

### 66.2.18.2 Macro Definition Documentation

66.2.18.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.18.3 Enumeration Type Documentation

#### 66.2.18.3.1 enum `clock_wdog_src_k24f12_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

#### 66.2.18.3.2 enum `clock_trace_src_k24f12_t`

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

### 66.2.18.3.3 enum clock\_port\_filter\_src\_k24f12\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.18.3.4 enum clock\_lptmr\_src\_k24f12\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.18.3.5 enum clock\_usbfs\_src\_k24f12\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPIFUSel* Clock divider USB FS clock.

### 66.2.18.3.6 enum clock\_flexcan\_src\_k24f12\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

### 66.2.18.3.7 enum clock\_sdhc\_src\_k24f12\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPIFUSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

## SIM HAL driver

### 66.2.18.3.8 enum clock\_sai\_src\_k24f12\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.18.3.9 enum clock\_pllfl\_sel\_k24f12\_t

Enumerator

*kClockPllFlSelFll* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.  
*kClockPllFlSelIrc48M* IRC48MCLK.

### 66.2.18.3.10 enum clock\_er32k\_src\_k24f12\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.18.3.11 enum clock\_clkout\_src\_k24f12\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.18.3.12 enum clock\_rtcout\_src\_k24f12\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

### 66.2.18.3.13 enum sim\_usbsstby\_mode\_k24f12\_t

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes

*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.18.3.14 enum sim\_usbvstby\_mode\_k24f12\_t

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes

*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.18.3.15 enum sim\_adc\_pretrg\_sel\_k24f12\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.

*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.18.3.16 enum sim\_adc\_trg\_sel\_k24f12\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.

*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.

*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.

*kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.

*kSimAdcTrgSelPit0* PIT trigger 0.

*kSimAdcTrgSelPit1* PIT trigger 1.

*kSimAdcTrgSelPit2* PIT trigger 2.

*kSimAdcTrgSelPit3* PIT trigger 3.

*kSimAdcTrgSelFtm0* FTM0 trigger.

*kSimAdcTrgSelFtm1* FTM1 trigger.

*kSimAdcTrgSelFtm2* FTM2 trigger.

*kSimAdcTrgSelFtm3* FTM3 trigger.

*kSimAdcTrgSelRtcAlarm* RTC alarm.

*kSimAdcTrgSelRtcSec* RTC seconds.

*kSimAdcTrgSelLptimer* Low-power timer trigger.

## SIM HAL driver

### 66.2.18.3.17 enum sim\_uart\_rxsrc\_k24f12\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

### 66.2.18.3.18 enum sim\_uart\_txsrc\_k24f12\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.18.3.19 enum sim\_ftm\_trg\_src\_k24f12\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.18.3.20 enum sim\_ftm\_clk\_sel\_k24f12\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

### 66.2.18.3.21 enum sim\_ftm\_ch\_src\_k24f12\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.  
*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.  
*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.  
*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.18.3.22 enum sim\_ftmflt\_sel\_k24f12\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.  
*kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.18.3.23 enum sim\_tpm\_clk\_sel\_k24f12\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.18.3.24 enum sim\_tpm\_ch\_src\_k24f12\_t**

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

**66.2.18.3.25 enum sim\_cmtuartpad\_streng\_h\_k24f12\_t**

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

**66.2.18.3.26 enum sim\_ptd7pad\_streng\_h\_k24f12\_t**

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

**66.2.18.3.27 enum sim\_flexbus\_security\_level\_k24f12\_t**

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

**66.2.18.3.28 enum sim\_clock\_gate\_name\_k24f12\_t**

## SIM HAL driver

### 66.2.19 K24F25612 SIM HAL driver

#### 66.2.19.1 Overview

The section describes the enumerations, macros and data structures for K24F25612 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK24F25612.h](#)

## 66.2.19.2 Macro Definition Documentation

66.2.19.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.19.3 Enumeration Type Documentation

66.2.19.3.1 enum `clock_wdog_src_k24f25612_t`

Enumerator

- kClockWdogSrcLpoClk* LPO.
- kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

66.2.19.3.2 enum `clock_trace_src_k24f25612_t`

Enumerator

- kClockTraceSrcMcgoutClk* MCG out clock.
- kClockTraceSrcCoreClk* core clock

66.2.19.3.3 enum `clock_port_filter_src_k24f25612_t`

Enumerator

- kClockPortFilterSrcBusClk* Bus clock.
- kClockPortFilterSrcLpoClk* LPO.

66.2.19.3.4 enum `clock_lptmr_src_k24f25612_t`

Enumerator

- kClockLptmrSrcMcgIrClk* MCGIRCLK.

## SIM HAL driver

*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.19.3.5 enum clock\_usbfs\_src\_k24f25612\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

### 66.2.19.3.6 enum clock\_flexcan\_src\_k24f25612\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

### 66.2.19.3.7 enum clock\_sai\_src\_k24f25612\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.19.3.8 enum clock\_pllfl\_sel\_k24f25612\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.  
*kClockPllFllSelIrc48M* IRC48MCLK.

### 66.2.19.3.9 enum clock\_er32k\_src\_k24f25612\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

**66.2.19.3.10 enum clock\_clkout\_src\_k24f25612\_t**

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

**66.2.19.3.11 enum clock\_rtcout\_src\_k24f25612\_t**

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

**66.2.19.3.12 enum sim\_usbsstby\_mode\_k24f25612\_t**

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

**66.2.19.3.13 enum sim\_usbvstby\_mode\_k24f25612\_t**

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

**66.2.19.3.14 enum sim\_adc\_pretrg\_sel\_k24f25612\_t**

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

## SIM HAL driver

### 66.2.19.3.15 enum sim\_adc\_trg\_sel\_k24f25612\_t

Enumerator

- kSimAdcTrgselExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelPit0* PIT trigger 0.
- kSimAdcTrgSelPit1* PIT trigger 1.
- kSimAdcTrgSelPit2* PIT trigger 2.
- kSimAdcTrgSelPit3* PIT trigger 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.
- kSimAdcTrgSelFtm3* FTM3 trigger.
- kSimAdcTrgSelRtcAlarm* RTC alarm.
- kSimAdcTrgSelRtcSec* RTC seconds.
- kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.19.3.16 enum sim\_uart\_rxsrc\_k24f25612\_t

Enumerator

- kSimUartRxsrcPin* UARTx\_RX Pin.
- kSimUartRxsrcCmp0* CMP0.
- kSimUartRxsrcCmp1* CMP1.

### 66.2.19.3.17 enum sim\_uart\_txsrc\_k24f25612\_t

Enumerator

- kSimUartTxsrcPin* UARTx\_TX Pin.
- kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.
- kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.19.3.18 enum sim\_ftm\_trg\_src\_k24f25612\_t

Enumerator

- kSimFtmTrgSrc0* FlexTimer x trigger y select 0.
- kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

**66.2.19.3.19 enum sim\_ftm\_clk\_sel\_k24f25612\_t**

Enumerator

- kSimFtmClkSel0* FTM CLKIN0 pin.
- kSimFtmClkSel1* FTM CLKIN1 pin.

**66.2.19.3.20 enum sim\_ftm\_ch\_src\_k24f25612\_t**

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

**66.2.19.3.21 enum sim\_ftmflt\_sel\_k24f25612\_t**

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.19.3.22 enum sim\_tpm\_clk\_sel\_k24f25612\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.19.3.23 enum sim\_tpm\_ch\_src\_k24f25612\_t**

Enumerator

- kSimTpmChSrc0* TPMx\_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

**66.2.19.3.24 enum sim\_cmtuartpad\_strength\_k24f25612\_t**

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

---

## SIM HAL driver

66.2.20.2 Macro Definition Documentation

66.2.20.2.1 `#define FSL_SIM_SCGC_BIT(SCGCx, n) (((SCGCx-1U)<<5U) + n)`

66.2.20.3 Enumeration Type Documentation

66.2.20.3.1 `enum clock_wdog_src_k26f18_t`

Enumerator

kClockWdogSrcLpoClk LPO.

kClockWdogSrcAltClk Alternative clock, for this SOC it is Bus clock.

SIM HAL driver

66.2.20.3.2 enum clock_trace_src_k26f18_t

Enumerator

kClockTraceSrcMcgoutClkDiv MCG out clock divided by the fractional divider configured by SIM_CLKDIV4[TRACEFRAC, TRACEDIV].
kClockTraceSrcCoreClk core clock

66.2.20.3.3 enum clock_port_filter_src_k26f18_t

Enumerator

kClockPortFilterSrcBusClk Bus clock.
kClockPortFilterSrcLpoClk LPO.

66.2.20.3.4 enum clock_tpm_src_k26f18_t

Enumerator

kClockTpmSrcNone clock disabled
kClockTpmSrcPllFllSelDiv clock as selected by SOPT2[PLLFLSEL] and divided by the fractional divider configured by SIM_CLKDIV3[PLLFLFRAC, PLLFLLDIV].
kClockTpmSrcOsc0erClk OSCERCLK clock.
kClockTpmSrcMcgIrClk MCGIR clock.

66.2.20.3.5 enum clock_lptmr_src_k26f18_t

Enumerator

kClockLptmrSrcMcgIrClk MCGIRCLK.
kClockLptmrSrcLpoClk LPO clock.
kClockLptmrSrcEr32kClk ERCLK32K clock.
kClockLptmrSrcOsc0erClkUndiv OSCERCLK_UNDIV clock.

66.2.20.3.6 enum clock_lpuart_src_k26f18_t

Enumerator

kClockLpuartSrcNone Clock disabled.
kClockLpuartSrcPllFllSel Clock as selected by SOPT2[PLLFLSEL].
kClockLpuartSrcOsc0erClk OSCERCLK.
kClockLpuartSrcMcgIrClk MCGIRCLK.

66.2.21 K30D10 SIM HAL driver

66.2.21.1 Overview

The section describes the enumerations, macros and data structures for K30D10 SIM HAL driver.

Files

- file [fsl_sim_hal_MK30D10.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k30d10_t](#) {
[kClockWdogSrcLpoClk](#),
[kClockWdogSrcAltClk](#) }
WDOG clock source select.
- enum [clock_trace_src_k30d10_t](#) {
[kClockTraceSrcMcgoutClk](#),
[kClockTraceSrcCoreClk](#) }
Debug trace clock source select.
- enum [clock_port_filter_src_k30d10_t](#) {
[kClockPortFilterSrcBusClk](#),
[kClockPortFilterSrcLpoClk](#) }
PORTx digital input filter clock source select.
- enum [clock_lptmr_src_k30d10_t](#) {
[kClockLptmrSrcMcgIrClk](#),
[kClockLptmrSrcLpoClk](#),
[kClockLptmrSrcEr32kClk](#),
[kClockLptmrSrcOsc0erClk](#) }
LPTMR clock source select.
- enum [clock_time_src_k30d10_t](#) {
[kClockTimeSrcCoreSysClk](#),
[kClockTimeSrcPIIFilSel](#),
[kClockTimeSrcOsc0erClk](#),
[kClockTimeSrcExt](#) }
SIM timestamp clock source.
- enum [clock_rmii_src_k30d10_t](#) {
[kClockRmiiSrcExtalClk](#),
[kClockRmiiSrcExt](#) }
SIM RMII clock source.

SIM HAL driver

- enum `clock_flexcan_src_k30d10_t` {
`kClockFlexcanSrcOsc0erClk`,
`kClockFlexcanSrcBusClk` }
FLEXCAN clock source select.
- enum `clock_sdhc_src_k30d10_t` {
`kClockSdhcSrcCoreSysClk`,
`kClockSdhcSrcPllFllSel`,
`kClockSdhcSrcOsc0erClk`,
`kClockSdhcSrcExt` }
SDHC clock source.
- enum `clock_sai_src_k30d10_t` {
`kClockSaiSrcSysClk` = 0U,
`kClockSaiSrcOsc0erClk` = 1U,
`kClockSaiSrcPllClk` = 3U }
SAI clock source.
- enum `clock_tsi_active_mode_src_k30d10_t` {
`kClockTsiActiveSrcBusClk`,
`kClockTsiActiveSrcMcgIrClk`,
`kClockTsiActiveSrcOsc0erClk` }
TSI Active Mode clock source.
- enum `clock_tsi_lp_mode_src_k30d10_t` {
`kClockTsiLpSrcLpoClk`,
`kClockTsiLpSrcEr32kClk` }
TSI Low-power Mode clock source.
- enum `clock_pllfl_sel_k30d10_t` {
`kClockPllFllSelFll` = 0U,
`kClockPllFllSelPll` = 1U }
SIM PLLFLLSEL clock source select.
- enum `clock_er32k_src_k30d10_t` {
`kClockEr32kSrcOsc0` = 0U,
`kClockEr32kSrcRtc` = 2U,
`kClockEr32kSrcLpo` = 3U }
SIM external reference clock source select (OSC32KSEL).
- enum `clock_clkout_src_k30d10_t` {
`kClockClkoutSelFlexbusClk` = 0U,
`kClockClkoutSelFlashClk` = 2U,
`kClockClkoutSelLpoClk` = 3U,
`kClockClkoutSelMcgIrClk` = 4U,
`kClockClkoutSelRtc32kClk` = 5U,
`kClockClkoutSelOsc0erClk` = 6U }
SIM CLKOUT_SEL clock source select.
- enum `clock_rtcout_src_k30d10_t` {
`kClockRtcoutSrc1Hz`,
`kClockRtcoutSrc32kHz` }
SIM RTCCLKOUTSEL clock source select.
- enum `sim_adc_pretrg_sel_k30d10_t` {
`kSimAdcPretrgSelA`,

- kSimAdcPretrgSelB }
 - SIM ADCx pre-trigger select.*
- enum `sim_adc_trg_sel_k30d10_t` {
 - kSimAdcTrgSelExt = 0U,

 - kSimUartRxsrcPin,
 - kSimUartRxsrcCmp0,
 - kSimUartRxsrcCmp1 }
 - SIM UART receive data source select.*
- enum `sim_uart_txsrc_k30d10_t` {
 - kSimUartTxsrcPin,
 - kSimUartTxsrcFtm1,
 - kSimUartTxsrcFtm2 }
 - SIM UART transmit data source select.*
- enum `sim_ftm_trg_src_k30d10_t` {
 - kSimFtmTrgSrc0,
 - kSimFtmTrgSrc1 }
 - SIM FlexTimer x trigger y select.*
- enum `sim_ftm_clk_sel_k30d10_t` {
 - kSimFtmClkSel0,
 - kSimFtmClkSel1 }
 - SIM FlexTimer external clock select.*
- enum `sim_ftm_ch_src_k30d10_t` {
 - kSimFtmChSrc0,
 - kSimFtmChSrc1,
 - kSimFtmChSrc2,
 - kSimFtmChSrc3 }
 - SIM FlexTimer x channel y input capture source select.*
- enum `sim_ftmflt_sel_k30d10_t` {
 - kSimFtmFltSel0,
 - kSimFtmFltSel1 }
 - SIM FlexTimer x Fault y select.*
- enum `sim_tpm_clk_sel_k30d10_t` {

SIM HAL driver

- `kSimTpmClkSel0,`
 - `kSimTpmClkSel1 }`

SIM Timer/PWM external clock select.
- enum `sim_tpm_ch_src_k30d10_t` {
 - `kSimTpmChSrc0,`
 - `kSimTpmChSrc1 }`

SIM Timer/PWM x channel y input capture source select.
- enum `sim_cmtuartpad_strength_k30d10_t` {
 - `kSimCmtuartSinglePad,`
 - `kSimCmtuartDualPad }`

SIM CMT/UART pad drive strength.
- enum `sim_ptd7pad_strength_k30d10_t` {
 - `kSimPtd7padSinglePad,`
 - `kSimPtd7padDualPad }`

SIM PTD7 pad drive strength.
- enum `sim_flexbus_security_level_k30d10_t` {
 - `kSimFbslLevel0,`
 - `kSimFbslLevel1,`
 - `kSimFbslLevel2,`
 - `kSimFbslLevel3 }`

SIM FlexBus security level.
- enum `sim_clock_gate_name_k30d10_t`

Clock gate name used for SIM_HAL_EnableClock/SIM_HAL_DisableClock.

66.2.21.2 Macro Definition Documentation

66.2.21.2.1 `#define FSL_SIM_SCGC_BIT(SCGCx, n) (((SCGCx-1U)<<5U) + n)`

66.2.21.3 Enumeration Type Documentation

66.2.21.3.1 enum `clock_wdog_src_k30d10_t`

Enumerator

- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for K30D10 it is Bus clock.

66.2.21.3.2 enum `clock_trace_src_k30d10_t`

Enumerator

- `kClockTraceSrcMcgoutClk` MCG out clock.
- `kClockTraceSrcCoreClk` core clock

66.2.21.3.3 enum clock_port_filter_src_k30d10_t

Enumerator

kClockPortFilterSrcBusClk Bus clock.
kClockPortFilterSrcLpoClk LPO.

66.2.21.3.4 enum clock_lptmr_src_k30d10_t

Enumerator

kClockLptmrSrcMcgIrClk MCG IRC clock.
kClockLptmrSrcLpoClk LPO clock.
kClockLptmrSrcEr32kClk ERCLK32K clock.
kClockLptmrSrcOsc0erClk OSCERCLK clock.

66.2.21.3.5 enum clock_time_src_k30d10_t

Enumerator

kClockTimeSrcCoreSysClk Core/system clock.
kClockTimeSrcPllFllSel clock as selected by SOPT2[PLLFLLSSEL].
kClockTimeSrcOsc0erClk OSCERCLK clock.
kClockTimeSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.21.3.6 enum clock_rmii_src_k30d10_t

Enumerator

kClockRmiiSrcExtalClk EXTAL Clock.
kClockRmiiSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.21.3.7 enum clock_flexcan_src_k30d10_t

Enumerator

kClockFlexcanSrcOsc0erClk OSCERCLK.
kClockFlexcanSrcBusClk Bus clock.

SIM HAL driver

66.2.21.3.8 enum clock_sdhc_src_k30d10_t

Enumerator

- kClockSdhcSrcCoreSysClk* Core/system clock.
- kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLLSEL].
- kClockSdhcSrcOsc0erClk* OSCERCLK clock.
- kClockSdhcSrcExt* External bypass clock (SDHC0_CLKIN)

66.2.21.3.9 enum clock_sai_src_k30d10_t

Enumerator

- kClockSaiSrcSysClk* SYSCLK.
- kClockSaiSrcOsc0erClk* OSC0ERCLK.
- kClockSaiSrcPllClk* MCGPLLCLK.

66.2.21.3.10 enum clock_tsi_active_mode_src_k30d10_t

Enumerator

- kClockTsiActiveSrcBusClk* Bus clock.
- kClockTsiActiveSrcMcgIrClk* MCG IRC clock.
- kClockTsiActiveSrcOsc0erClk* OSCERCLK clock.

66.2.21.3.11 enum clock_tsi_lp_mode_src_k30d10_t

Enumerator

- kClockTsiLpSrcLpoClk* LPO clock.
- kClockTsiLpSrcEr32kClk* ERCLK32K clock.

66.2.21.3.12 enum clock_pllfl_sel_k30d10_t

Enumerator

- kClockPllFllSelFll* Fll clock.
- kClockPllFllSelPll* Pll0 clock.

66.2.21.3.13 enum clock_er32k_src_k30d10_t

Enumerator

kClockEr32kSrcOsc0 OSC0 clock (OSC032KCLK).
kClockEr32kSrcRtc RTC 32k clock .
kClockEr32kSrcLpo LPO clock.

66.2.21.3.14 enum clock_clkout_src_k30d10_t

Enumerator

kClockClkoutSelFlexbusClk Flexbus clock.
kClockClkoutSelFlashClk Flash clock.
kClockClkoutSelLpoClk LPO clock.
kClockClkoutSelMcgIrClk MCG out clock.
kClockClkoutSelRtc32kClk RTC 32k clock.
kClockClkoutSelOsc0erClk OSCERCLK0 clock.

66.2.21.3.15 enum clock_rtcout_src_k30d10_t

Enumerator

kClockRtcoutSrc1Hz 1Hz clock
kClockRtcoutSrc32kHz 32kHz clock

66.2.21.3.16 enum sim_adc_pretrg_sel_k30d10_t

Enumerator

kSimAdcPretrgSelA Pre-trigger A selected for ADCx.
kSimAdcPretrgSelB Pre-trigger B selected for ADCx.

66.2.21.3.17 enum sim_adc_trg_sel_k30d10_t

Enumerator

kSimAdcTrgSelExt External trigger.
kSimAdcTrgSelHighSpeedComp0 High speed comparator 0 output.
kSimAdcTrgSelHighSpeedComp1 High speed comparator 1 output.
kSimAdcTrgSelHighSpeedComp2 High speed comparator 2 output.
kSimAdcTrgSelPit0 PIT trigger 0.
kSimAdcTrgSelPit1 PIT trigger 1.

SIM HAL driver

kSimAdcTrgSelPit2 PIT trigger 2.
kSimAdcTrgSelPit3 PIT trigger 3.
kSimAdcTrgSelFtm0 FTM0 trigger.
kSimAdcTrgSelFtm1 FTM1 trigger.
kSimAdcTrgSelFtm2 FTM2 trigger.
kSimAdcTrgSelRtcAlarm RTC alarm.
kSimAdcTrgSelRtcSec RTC seconds.
kSimAdcTrgSelLptimer Low-power timer trigger.

66.2.21.3.18 enum sim_uart_rxsrc_k30d10_t

Enumerator

kSimUartRxsrcPin UARTx_RX Pin.
kSimUartRxsrcCmp0 CMP0.
kSimUartRxsrcCmp1 CMP1.

66.2.21.3.19 enum sim_uart_txsrc_k30d10_t

Enumerator

kSimUartTxsrcPin UARTx_TX Pin.
kSimUartTxsrcFtm1 UARTx_TX pin modulated with FTM1 channel 0 output.
kSimUartTxsrcFtm2 UARTx_TX pin modulated with FTM2 channel 0 output.

66.2.21.3.20 enum sim_ftm_trg_src_k30d10_t

Enumerator

kSimFtmTrgSrc0 FlexTimer x trigger y select 0.
kSimFtmTrgSrc1 FlexTimer x trigger y select 1.

66.2.21.3.21 enum sim_ftm_clk_sel_k30d10_t

Enumerator

kSimFtmClkSel0 FTM CLKIN0 pin.
kSimFtmClkSel1 FTM CLKIN1 pin.

66.2.21.3.22 enum sim_ftm_ch_src_k30d10_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

66.2.21.3.23 enum sim_ftmflt_sel_k30d10_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

66.2.21.3.24 enum sim_tpm_clk_sel_k30d10_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM_CLKIN1 pin.

66.2.21.3.25 enum sim_tpm_ch_src_k30d10_t

Enumerator

- kSimTpmChSrc0* TPMx_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

66.2.21.3.26 enum sim_cmtuartpad_streng_h_k30d10_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0_TXD.

66.2.21.3.27 enum sim_ptd7pad_streng_h_k30d10_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

SIM HAL driver

66.2.21.3.28 enum sim_flexbus_security_level_k30d10_t

Enumerator

kSimFbslLevel0 FlexBus security level 0.

kSimFbslLevel1 FlexBus security level 1.

kSimFbslLevel2 FlexBus security level 2.

kSimFbslLevel3 FlexBus security level 3.

66.2.21.3.29 enum sim_clock_gate_name_k30d10_t

66.2.22 K40D10 SIM HAL driver

66.2.22.1 Overview

The section describes the enumerations, macros and data structures for K40D10 SIM HAL driver.

Files

- file [fsl_sim_hal_MK40D10.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k40d10_t](#) {
[kClockWdogSrcLpoClk](#),

kClockClkoutSelRtc32kClk RTC 32k clock.
kClockClkoutSelOsc0erClk OSCERCLK0 clock.

66.2.22.3.15 enum clock_rtcout_src_k40d10_t

Enumerator

kClockRtcoutSrc1Hz 1Hz clock
kClockRtcoutSrc32kHz 32kHz clock

66.2.22.3.16 enum sim_adc_pretrg_sel_k40d10_t

Enumerator

kSimAdcPretrgSelA Pre-trigger A selected for ADCx.
kSimAdcPretrgSelB Pre-trigger B selected for ADCx.

66.2.22.3.17 enum sim_adc_trg_sel_k40d10_t

Enumerator

kSimAdcTrgSelExt External trigger.
kSimAdcTrgSelHighSpeedComp0 High speed comparator 0 output.
kSimAdcTrgSelHighSpeedComp1 High speed comparator 1 output.
kSimAdcTrgSelHighSpeedComp2 High speed comparator 2 output.
kSimAdcTrgSelPit0 PIT trigger 0.
kSimAdcTrgSelPit1 PIT trigger 1.

SIM HAL driver

kSimAdcTrgSelPit2 PIT trigger 2.
kSimAdcTrgSelPit3 PIT trigger 3.
kSimAdcTrgSelFtm0 FTM0 trigger.
kSimAdcTrgSelFtm1 FTM1 trigger.
kSimAdcTrgSelFtm2 FTM2 trigger.
kSimAdcTrgSelRtcAlarm RTC alarm.
kSimAdcTrgSelRtcSec RTC seconds.
kSimAdcTrgSelLptimer Low-power timer trigger.

66.2.22.3.18 enum sim_uart_rxsrc_k40d10_t

Enumerator

kSimUartRxsrcPin UARTx_RX Pin.
kSimUartRxsrcCmp0 CMP0.
kSimUartRxsrcCmp1 CMP1.

66.2.22.3.19 enum sim_uart_txsrc_k40d10_t

Enumerator

kSimUartTxsrcPin UARTx_TX Pin.
kSimUartTxsrcFtm1 UARTx_TX pin modulated with FTM1 channel 0 output.
kSimUartTxsrcFtm2 UARTx_TX pin modulated with FTM2 channel 0 output.

66.2.22.3.20 enum sim_ftm_trg_src_k40d10_t

Enumerator

kSimFtmTrgSrc0 FlexTimer x trigger y select 0.
kSimFtmTrgSrc1 FlexTimer x trigger y select 1.

66.2.22.3.21 enum sim_ftm_clk_sel_k40d10_t

Enumerator

kSimFtmClkSel0 FTM CLKIN0 pin.
kSimFtmClkSel1 FTM CLKIN1 pin.

66.2.22.3.22 enum sim_ftm_ch_src_k40d10_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

66.2.22.3.23 enum sim_ftmflt_sel_k40d10_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

66.2.22.3.24 enum sim_tpm_clk_sel_k40d10_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM_CLKIN1 pin.

66.2.22.3.25 enum sim_tpm_ch_src_k40d10_t

Enumerator

- kSimTpmChSrc0* TPMx_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

66.2.22.3.26 enum sim_cmtuartpad_streng_h_k40d10_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0_TXD.

66.2.22.3.27 enum sim_ptd7pad_streng_h_k40d10_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

SIM HAL driver

66.2.22.3.28 enum sim_flexbus_security_level_k40d10_t

Enumerator

66.2.23 K50D10 SIM HAL driver

66.2.23.1 Overview

The section describes the enumerations, macros and data structures for K50D10 SIM HAL driver.

Files

- file [fsl_sim_hal_MK50D10.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k50d10_t](#) {
[kClockWdogSrcLpoClk](#),
[kClockWdogSrcAltClk](#) }
WDOG clock source select.
- enum [clock_trace_src_k50d10_t](#) {
[kClockTraceSrcMcgoutClk](#),
[kClockTraceSrcCoreClk](#) }
Debug trace clock source select.
- enum [clock_port_filter_src_k50d10_t](#) {
[kClockPortFilterSrcBusClk](#),
[kClockPortFilterSrcLpoClk](#) }
PORTx digital input filter clock source select.
- enum [clock_lptmr_src_k50d10_t](#) {
[kClockLptmrSrcMcgIrClk](#),
[kClockLptmrSrcLpoClk](#),
[kClockLptmrSrcEr32kClk](#),
[kClockLptmrSrcOsc0erClk](#) }
LPTMR clock source select.
- enum [clock_time_src_k50d10_t](#) {
[kClockTimeSrcCoreSysClk](#),
[kClockTimeSrcPIIFilSel](#),
[kClockTimeSrcOsc0erClk](#),
[kClockTimeSrcExt](#) }
SIM timestamp clock source.
- enum [clock_rmii_src_k50d10_t](#) {
[kClockRmiiSrcExtalClk](#),
[kClockRmiiSrcExt](#) }
SIM RMII clock source.

SIM HAL driver

- enum `clock_flexcan_src_k50d10_t` {
`kClockFlexcanSrcOsc0erClk`,
`kClockFlexcanSrcBusClk` }
FLEXCAN clock source select.
- enum `clock_sdhc_src_k50d10_t` {
`kClockSdhcSrcCoreSysClk`,
`kClockSdhcSrcPllFllSel`,
`kClockSdhcSrcOsc0erClk`,

Enumerator

- kClockTsiActiveSrcBusClk* Bus clock.
- kClockTsiActiveSrcMcgIrClk* MCG IRC clock.
- kClockTsiActiveSrcOsc0erClk* OSCERCLK clock.

66.2.23.3.11 enum clock_tsi_lp_mode_src_k50d10_t

Enumerator

- kClockTsiLpSrcLpoClk* LPO clock.
- kClockTsiLpSrcEr32kClk* ERCLK32K clock.

66.2.23.3.12 enum clock_pllfl_sel_k50d10_t

Enumerator

- kClockPllFllSelFll* Fll clock.
- kClockPllFllSelPll* Pll0 clock.

66.2.23.3.13 enum clock_er32k_src_k50d10_t

Enumerator

kClockEr32kSrcOsc0 OSC0 clock (OSC032KCLK).
kClockEr32kSrcRtc RTC 32k clock .
kClockEr32kSrcLpo LPO clock.

66.2.23.3.14 enum clock_clkout_src_k50d10_t

Enumerator

kClockClkoutSelFlexbusClk Flexbus clock.
kClockClkoutSelFlashClk Flash clock.
kClockClkoutSelLpoClk LPO clock.
kClockClkoutSelMcgIrClk MCG out clock.
kClockClkoutSelRtc32kClk RTC 32k clock.
kClockClkoutSelOsc0erClk OSCERCLK0 clock.

66.2.23.3.15 enum clock_rtcout_src_k50d10_t

Enumerator

kClockRtcoutSrc1Hz 1Hz clock
kClockRtcoutSrc32kHz 32kHz clock

66.2.23.3.16 enum sim_adc_pretrg_sel_k50d10_t

Enumerator

kSimAdcPretrgselA Pre-trigger A selected for ADCx.
kSimAdcPretrgselB Pre-trigger B selected for ADCx.

66.2.23.3.17 enum sim_adc_trg_sel_k50d10_t

Enumerator

kSimAdcTrgselExt External trigger.
kSimAdcTrgSelHighSpeedComp0 High speed comparator 0 output.
kSimAdcTrgSelHighSpeedComp1 High speed comparator 1 output.
kSimAdcTrgSelHighSpeedComp2 High speed comparator 2 output.
kSimAdcTrgSelPit0 PIT trigger 0.
kSimAdcTrgSelPit1 PIT trigger 1.

SIM HAL driver

kSimAdcTrgSelPit2 PIT trigger 2.
kSimAdcTrgSelPit3 PIT trigger 3.
kSimAdcTrgSelFtm0 FTM0 trigger.
kSimAdcTrgSelFtm1 FTM1 trigger.
kSimAdcTrgSelFtm2 FTM2 trigger.
kSimAdcTrgSelRtcAlarm RTC alarm.
kSimAdcTrgSelRtcSec RTC seconds.
kSimAdcTrgSelLptimer Low-power timer trigger.

66.2.23.3.18 enum sim_uart_rxsrc_k50d10_t

Enumerator

kSimUartRxsrcPin UARTx_RX Pin.
kSimUartRxsrcCmp0 CMP0.
kSimUartRxsrcCmp1 CMP1.

66.2.23.3.19 enum sim_uart_txsrc_k50d10_t

Enumerator

kSimUartTxsrcPin UARTx_TX Pin.
kSimUartTxsrcFtm1 UARTx_TX pin modulated with FTM1 channel 0 output.
kSimUartTxsrcFtm2 UARTx_TX pin modulated with FTM2 channel 0 output.

66.2.23.3.20 enum sim_ftm_trg_src_k50d10_t

Enumerator

kSimFtmTrgSrc0 FlexTimer x trigger y select 0.
kSimFtmTrgSrc1 FlexTimer x trigger y select 1.

66.2.23.3.21 enum sim_ftm_clk_sel_k50d10_t

Enumerator

kSimFtmClkSel0 FTM CLKIN0 pin.
kSimFtmClkSel1 FTM CLKIN1 pin.

66.2.23.3.22 enum sim_ftm_ch_src_k50d10_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

66.2.23.3.23 enum sim_ftmflt_sel_k50d10_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

66.2.23.3.24 enum sim_tpm_clk_sel_k50d10_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM_CLKIN1 pin.

66.2.23.3.25 enum sim_tpm_ch_src_k50d10_t

Enumerator

- kSimTpmChSrc0* TPMx_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

66.2.23.3.26 enum sim_cmtuartpad_streng_h_k50d10_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0_TXD.

66.2.23.3.27 enum sim_ptd7pad_streng_h_k50d10_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

SIM HAL driver

66.2.23.3.28 enum sim_flexbus_security_level_k50d10_t

Enumerator

kSimFbslLevel0 FlexBus security level 0.

kSimFbslLevel1 FlexBus security level 1.

kSimFbslLevel2 FlexBus security level 2.

kSimFbslLevel3 FlexBus security level 3.

66.2.23.3.29 enum sim_clock_gate_name_k50d10_t

66.2.24 K51D10 SIM HAL driver

66.2.24.1 Overview

The section describes the enumerations, macros and data structures for K51D10 SIM HAL driver.

Files

- file [fsl_sim_hal_MK51D10.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k51d10_t](#) {
[kClockWdogSrcLpoClk](#),
[kClockWdogSrcAltClk](#) }
WDOG clock source select.
- enum [clock_trace_src_k51d10_t](#) {
[kClockTraceSrcMcgoutClk](#),
[kClockTraceSrcCoreClk](#) }
Debug trace clock source select.
- enum [clock_port_filter_src_k51d10_t](#) {
[kClockPortFilterSrcBusClk](#),
[kClockPortFilterSrcLpoClk](#) }
PORTx digital input filter clock source select.
- enum [clock_lptmr_src_k51d10_t](#) {
[kClockLptmrSrcMcgIrClk](#),
[kClockLptmrSrcLpoClk](#),
[kClockLptmrSrcEr32kClk](#),
[kClockLptmrSrcOsc0erClk](#) }
LPTMR clock source select.
- enum [clock_time_src_k51d10_t](#) {
[kClockTimeSrcCoreSysClk](#),
[kClockTimeSrcPIIFilSel](#),
[kClockTimeSrcOsc0erClk](#),
[kClockTimeSrcExt](#) }
SIM timestamp clock source.
- enum [clock_rmii_src_k51d10_t](#) {
[kClockRmiiSrcExtalClk](#),
[kClockRmiiSrcExt](#) }
SIM RMII clock source.

SIM HAL driver

- enum `clock_flexcan_src_k51d10_t` {
`kClockFlexcanSrcOsc0erClk`,
`kClockFlexcanSrcBusClk` }
FLEXCAN clock source select.
- enum `clock_sdhc_src_k51d10_t` {
`kClockSdhcSrcCoreSysClk`,
`kClockSdhcSrcPllFllSel`,
`kClockSdhcSrcOsc0erClk`,
`kClockSdhcSrcExt` }
SDHC clock source.
- enum `clock_sai_src_k51d10_t` {
`kClockSaiSrcSysClk` = 0U,
`kClockSaiSrcOsc0erClk` = 1U,
`kClockSaiSrcPllClk` = 3U }
SAI clock source.
- enum `clock_tsi_active_mode_src_k51d10_t` {
`kClockTsiActiveSrcBusClk`,
`kClockTsiActiveSrcMcgIrClk`,
`kClockTsiActiveSrcOsc0erClk` }
TSI Active Mode clock source.
- enum `clock_tsi_lp_mode_src_k51d10_t` {
`kClockTsiLpSrcLpoClk`,
`kClockTsiLpSrcEr32kClk` }
TSI Low-power Mode clock source.
- enum `clock_pllfl_sel_k51d10_t` {
`kClockPllFllSelFll` = 0U,
`kClockPllFllSelPll` = 1U }
SIM PLLFLLSEL clock source select.
- enum `clock_er32k_src_k51d10_t` {
`kClockEr32kSrcOsc0` = 0U,
`kClockEr32kSrcRtc` = 2U,
`kClockEr32kSrcLpo` = 3U }
SIM external reference clock source select (OSC32KSEL).
- enum `clock_clkout_src_k51d10_t` {
`kClockClkoutSelFlexbusClk` = 0U,
`kClockClkoutSelFlashClk` = 2U,
`kClockClkoutSelLpoClk` = 3U,
`kClockClkoutSelMcgIrClk` = 4U,
`kClockClkoutSelRtc32kClk` = 5U,
`kClockClkoutSelOsc0erClk` = 6U }
SIM CLKOUT_SEL clock source select.
- enum `clock_rtcout_src_k51d10_t` {
`kClockRtcoutSrc1Hz`,
`kClockRtcoutSrc32kHz` }
SIM RTCCLKOUTSEL clock source select.
- enum `sim_adc_pretrg_sel_k51d10_t` {
`kSimAdcPretrgSelA`,

- kSimAdcPretrgSelB }
 - SIM ADCx pre-trigger select.*
- enum `sim_adc_trg_sel_k51d10_t` {
 - kSimAdcTrgSelExt = 0U,
 - kSimAdcTrgSelHighSpeedComp0 = 1U,
 - kSimAdcTrgSelHighSpeedComp1 = 2U,
 - kSimAdcTrgSelHighSpeedComp2 = 3U,
 - kSimAdcTrgSelPit0 = 4U,
 - kSimAdcTrgSelPit1 = 5U,
 - kSimAdcTrgSelPit2 = 6U,
 - kSimAdcTrgSelPit3 = 7U,
 - kSimAdcTrgSelFtm0 = 8U,
 - kSimAdcTrgSelFtm1 = 9U,
 - kSimAdcTrgSelFtm2 = 10U,
 - kSimAdcTrgSelRtcAlarm = 12U,
 - kSimAdcTrgSelRtcSec = 13U,
 - kSimAdcTrgSelLptimer = 14U }
 - SIM ADCx trigger select.*
- enum `sim_uart_rxsrc_k51d10_t` {
 - kSimUartRxsrcPin,
 - kSimUartRxsrcCmp0,
 - kSimUartRxsrcCmp1 }
 - SIM UART receive data source select.*
- enum `sim_uart_txsrc_k51d10_t` {
 - kSimUartTxsrcPin,
 - kSimUartTxsrcFtm1,
 - kSimUartTxsrcFtm2 }
 - SIM UART transmit data source select.*
- enum `sim_ftm_trg_src_k51d10_t` {
 - kSimFtmTrgSrc0,
 - kSimFtmTrgSrc1 }
 - SIM FlexTimer x trigger y select.*
- enum `sim_ftm_clk_sel_k51d10_t` {
 - kSimFtmClkSel0,
 - kSimFtmClkSel1 }
 - SIM FlexTimer external clock select.*
- enum `sim_ftm_ch_src_k51d10_t` {
 - kSimFtmChSrc0,
 - kSimFtmChSrc1,
 - kSimFtmChSrc2,
 - kSimFtmChSrc3 }
 - SIM FlexTimer x channel y input capture source select.*
- enum `sim_ftmflt_sel_k51d10_t` {
 - kSimFtmFltSel0,
 - kSimFtmFltSel1 }
 - SIM FlexTimer x Fault y select.*
- enum `sim_tpm_clk_sel_k51d10_t` {

SIM HAL driver

- `kSimTpmClkSel0,`
 - `kSimTpmClkSel1 }`

SIM Timer/PWM external clock select.
- enum `sim_tpm_ch_src_k51d10_t` {
 - `kSimTpmChSrc0,`
 - `kSimTpmChSrc1 }`

SIM Timer/PWM x channel y input capture source select.
- enum `sim_cmtuartpad_strenght_k51d10_t` {
 - `kSimCmtuartSinglePad,`
 - `kSimCmtuartDualPad }`

SIM CMT/UART pad drive strength.
- enum `sim_ptd7pad_strenght_k51d10_t` {
 - `kSimPtd7padSinglePad,`
 - `kSimPtd7padDualPad }`

SIM PTD7 pad drive strength.
- enum `sim_flexbus_security_level_k51d10_t` {
 - `kSimFbslLevel0,`
 - `kSimFbslLevel1,`
 - `kSimFbslLevel2,`
 - `kSimFbslLevel3 }`

SIM FlexBus security level.
- enum `sim_clock_gate_name_k51d10_t`

Clock gate name used for SIM_HAL_EnableClock/SIM_HAL_DisableClock.

66.2.24.2 Macro Definition Documentation

66.2.24.2.1 `#define FSL_SIM_SCGC_BIT(SCGCx, n) (((SCGCx-1U)<<5U) + n)`

66.2.24.3 Enumeration Type Documentation

66.2.24.3.1 enum `clock_wdog_src_k51d10_t`

Enumerator

kClockWdogSrcLpoClk LPO.

kClockWdogSrcAltClk Alternative clock, for K51D10 it is Bus clock.

66.2.24.3.2 enum `clock_trace_src_k51d10_t`

Enumerator

kClockTraceSrcMcgoutClk MCG out clock.

kClockTraceSrcCoreClk core clock

66.2.24.3.3 enum clock_port_filter_src_k51d10_t

Enumerator

kClockPortFilterSrcBusClk Bus clock.
kClockPortFilterSrcLpoClk LPO.

66.2.24.3.4 enum clock_lptmr_src_k51d10_t

Enumerator

kClockLptmrSrcMcgIrClk MCG IRC clock.
kClockLptmrSrcLpoClk LPO clock.
kClockLptmrSrcEr32kClk ERCLK32K clock.
kClockLptmrSrcOsc0erClk OSCERCLK clock.

66.2.24.3.5 enum clock_time_src_k51d10_t

Enumerator

kClockTimeSrcCoreSysClk Core/system clock.
kClockTimeSrcPllFllSel clock as selected by SOPT2[PLLFLLSSEL].
kClockTimeSrcOsc0erClk OSCERCLK clock.
kClockTimeSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.24.3.6 enum clock_rmii_src_k51d10_t

Enumerator

kClockRmiiSrcExtalClk EXTAL Clock.
kClockRmiiSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.24.3.7 enum clock_flexcan_src_k51d10_t

Enumerator

kClockFlexcanSrcOsc0erClk OSCERCLK.
kClockFlexcanSrcBusClk Bus clock.

SIM HAL driver

66.2.24.3.8 enum clock_sdhc_src_k51d10_t

Enumerator

kClockSdhcSrcCoreSysClk Core/system clock.
kClockSdhcSrcPllFllSel clock as selected by SOPT2[PLLFLLSEL].
kClockSdhcSrcOsc0erClk OSCERCLK clock.
kClockSdhcSrcExt External bypass clock (SDHC0_CLKIN)

66.2.24.3.9 enum clock_sai_src_k51d10_t

Enumerator

kClockSaiSrcSysClk SYSCLK.
kClockSaiSrcOsc0erClk OSC0ERCLK.
kClockSaiSrcPllClk MCGPLLCLK.

66.2.24.3.10 enum clock_tsi_active_mode_src_k51d10_t

Enumerator

kClockTsiActiveSrcBusClk Bus clock.
kClockTsiActiveSrcMcgIrClk MCG IRC clock.
kClockTsiActiveSrcOsc0erClk OSCERCLK clock.

66.2.24.3.11 enum clock_tsi_lp_mode_src_k51d10_t

Enumerator

kClockTsiLpSrcLpoClk LPO clock.
kClockTsiLpSrcEr32kClk ERCLK32K clock.

66.2.24.3.12 enum clock_pllfl_sel_k51d10_t

Enumerator

kClockPllFllSelFll Fll clock.
kClockPllFllSelPll Pll0 clock.

66.2.24.3.13 enum clock_er32k_src_k51d10_t

Enumerator

kClockEr32kSrcOsc0 OSC0 clock (OSC032KCLK).
kClockEr32kSrcRtc RTC 32k clock .
kClockEr32kSrcLpo LPO clock.

66.2.24.3.14 enum clock_clkout_src_k51d10_t

Enumerator

kClockClkoutSelFlexbusClk Flexbus clock.
kClockClkoutSelFlashClk Flash clock.
kClockClkoutSelLpoClk LPO clock.
kClockClkoutSelMcgIrClk MCG out clock.
kClockClkoutSelRtc32kClk RTC 32k clock.
kClockClkoutSelOsc0erClk OSCERCLK0 clock.

66.2.24.3.15 enum clock_rtcout_src_k51d10_t

Enumerator

kClockRtcoutSrc1Hz 1Hz clock
kClockRtcoutSrc32kHz 32kHz clock

66.2.24.3.16 enum sim_adc_pretrg_sel_k51d10_t

Enumerator

kSimAdcPretrgselA Pre-trigger A selected for ADCx.
kSimAdcPretrgselB Pre-trigger B selected for ADCx.

66.2.24.3.17 enum sim_adc_trg_sel_k51d10_t

Enumerator

kSimAdcTrgselExt External trigger.
kSimAdcTrgSelHighSpeedComp0 High speed comparator 0 output.
kSimAdcTrgSelHighSpeedComp1 High speed comparator 1 output.
kSimAdcTrgSelHighSpeedComp2 High speed comparator 2 output.
kSimAdcTrgSelPit0 PIT trigger 0.
kSimAdcTrgSelPit1 PIT trigger 1.

SIM HAL driver

kSimAdcTrgSelPit2 PIT trigger 2.
kSimAdcTrgSelPit3 PIT trigger 3.
kSimAdcTrgSelFtm0 FTM0 trigger.
kSimAdcTrgSelFtm1 FTM1 trigger.
kSimAdcTrgSelFtm2 FTM2 trigger.
kSimAdcTrgSelRtcAlarm RTC alarm.
kSimAdcTrgSelRtcSec RTC seconds.
kSimAdcTrgSelLptimer Low-power timer trigger.

66.2.24.3.18 enum sim_uart_rxsrc_k51d10_t

Enumerator

kSimUartRxsrcPin UARTx_RX Pin.
kSimUartRxsrcCmp0 CMP0.
kSimUartRxsrcCmp1 CMP1.

66.2.24.3.19 enum sim_uart_txsrc_k51d10_t

Enumerator

kSimUartTxsrcPin UARTx_TX Pin.
kSimUartTxsrcFtm1 UARTx_TX pin modulated with FTM1 channel 0 output.
kSimUartTxsrcFtm2 UARTx_TX pin modulated with FTM2 channel 0 output.

66.2.24.3.20 enum sim_ftm_trg_src_k51d10_t

Enumerator

kSimFtmTrgSrc0 FlexTimer x trigger y select 0.
kSimFtmTrgSrc1 FlexTimer x trigger y select 1.

66.2.24.3.21 enum sim_ftm_clk_sel_k51d10_t

Enumerator

kSimFtmClkSel0 FTM CLKIN0 pin.
kSimFtmClkSel1 FTM CLKIN1 pin.

66.2.24.3.22 enum sim_ftm_ch_src_k51d10_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

66.2.24.3.23 enum sim_ftmflt_sel_k51d10_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

66.2.24.3.24 enum sim_tpm_clk_sel_k51d10_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM_CLKIN1 pin.

66.2.24.3.25 enum sim_tpm_ch_src_k51d10_t

Enumerator

- kSimTpmChSrc0* TPMx_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

66.2.24.3.26 enum sim_cmtuartpad_streng_h_k51d10_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0_TXD.

66.2.24.3.27 enum sim_ptd7pad_streng_h_k51d10_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

SIM HAL driver

66.2.24.3.28 enum sim_flexbus_security_level_k51d10_t

Enumerator

kSimFbslLevel0 FlexBus security level 0.

kSimFbslLevel1 FlexBus security level 1.

kSimFbslLevel2 FlexBus security level 2.

kSimFbslLevel3 FlexBus security level 3.

66.2.24.3.29 enum sim_clock_gate_name_k51d10_t

66.2.25 K52D10 SIM HAL driver

66.2.25.1 Overview

The section describes the enumerations, macros and data structures for K52D10 SIM HAL driver.

Files

- file [fsl_sim_hal_MK52D10.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k52d10_t](#) {
[kClockWdogSrcLpoClk](#),
[kClockWdogSrcAltClk](#) }
WDOG clock source select.
- enum [clock_trace_src_k52d10_t](#) {
[kClockTraceSrcMcgoutClk](#),
[kClockTraceSrcCoreClk](#) }
Debug trace clock source select.
- enum [clock_port_filter_src_k52d10_t](#) {
[kClockPortFilterSrcBusClk](#),
[kClockPortFilterSrcLpoClk](#) }
PORTx digital input filter clock source select.
- enum [clock_lptmr_src_k52d10_t](#) {
[kClockLptmrSrcMcgIrClk](#),
[kClockLptmrSrcLpoClk](#),
[kClockLptmrSrcEr32kClk](#),
[kClockLptmrSrcOsc0erClk](#) }
LPTMR clock source select.
- enum [clock_time_src_k52d10_t](#) {
[kClockTimeSrcCoreSysClk](#),
[kClockTimeSrcPIIFilSel](#),
[kClockTimeSrcOsc0erClk](#),
[kClockTimeSrcExt](#) }
SIM timestamp clock source.
- enum [clock_rmii_src_k52d10_t](#) {
[kClockRmiiSrcExtalClk](#),
[kClockRmiiSrcExt](#) }
SIM RMII clock source.

SIM HAL driver

- enum `clock_flexcan_src_k52d10_t` {
`kClockFlexcanSrcOsc0erClk`,
`kClockFlexcanSrcBusClk` }
FLEXCAN clock source select.
- enum `clock_sdhc_src_k52d10_t` {
`kClockSdhcSrcCoreSysClk`,
`kClockSdhcSrcPllFllSel`,
`kClockSdhcSrcOsc0erClk`,
`kClockSdhcSrcExt` }
SDHC clock source.
- enum `clock_sai_src_k52d10_t` {
`kClockSaiSrcSysClk` = 0U,
`kClockSaiSrcOsc0erClk` = 1U,
`kClockSaiSrcPllClk` = 3U }
SAI clock source.
- enum `clock_tsi_active_mode_src_k52d10_t` {
`kClockTsiActiveSrcBusClk`,
`kClockTsiActiveSrcMcgIrClk`,
`kClockTsiActiveSrcOsc0erClk` }
TSI Active Mode clock source.
- enum `clock_tsi_lp_mode_src_k52d10_t` {
`kClockTsiLpSrcLpoClk`,
`kClockTsiLpSrcEr32kClk` }
TSI Low-power Mode clock source.
- enum `clock_pllfl_sel_k52d10_t` {
`kClockPllFllSelFll` = 0U,
`kClockPllFllSelPll` = 1U }
SIM PLLFLLSEL clock source select.
- enum `clock_er32k_src_k52d10_t` {
`kClockEr32kSrcOsc0` = 0U,
`kClockEr32kSrcRtc` = 2U,
`kClockEr32kSrcLpo` = 3U }
SIM external reference clock source select (OSC32KSEL).
- enum `clock_clkout_src_k52d10_t` {
`kClockClkoutSelFlexbusClk` = 0U,
`kClockClkoutSelFlashClk` = 2U,
`kClockClkoutSelLpoClk` = 3U,
`kClockClkoutSelMcgIrClk` = 4U,
`kClockClkoutSelRtc32kClk` = 5U,
`kClockClkoutSelOsc0erClk` = 6U }
SIM CLKOUT_SEL clock source select.
- enum `clock_rtcout_src_k52d10_t` {
`kClockRtcoutSrc1Hz`,
`kClockRtcoutSrc32kHz` }
SIM RTCCLKOUTSEL clock source select.
- enum `sim_adc_pretrg_sel_k52d10_t` {
`kSimAdcPretrgselA`,

- `kSimAdcPretrgSelB }`
 - SIM ADCx pre-trigger select.*

66.2.25.2 Macro Definition Documentation

66.2.25.2.1 `#define FSL_SIM_SCGC_BIT(SCGCx, n) (((SCGCx-1U)<<5U) + n)`

66.2.25.3 Enumeration Type Documentation

66.2.25.3.1 enum `clock_wdog_src_k52d10_t`

Enumerator

kClockWdogSrcLpoClk LPO.

kClockWdogSrcAltClk Alternative clock, for K52D10 it is Bus clock.

66.2.25.3.2 enum `clock_trace_src_k52d10_t`

Enumerator

kClockTraceSrcMcgoutClk MCG out clock.

kClockTraceSrcCoreClk core clock

66.2.25.3.3 enum clock_port_filter_src_k52d10_t

Enumerator

kClockPortFilterSrcBusClk Bus clock.

kClockPortFilterSrcLpoClk LPO.

66.2.25.3.4 enum clock_lptmr_src_k52d10_t

Enumerator

kClockLptmrSrcMcgIrClk MCG IRC clock.

kClockLptmrSrcLpoClk LPO clock.

kClockLptmrSrcEr32kClk ERCLK32K clock.

kClockLptmrSrcOsc0erClk OSCERCLK clock.

66.2.25.3.5 enum clock_time_src_k52d10_t

Enumerator

kClockTimeSrcCoreSysClk Core/system clock.

kClockTimeSrcPllFllSel clock as selected by SOPT2[PLLFLLSSEL].

kClockTimeSrcOsc0erClk OSCERCLK clock.

kClockTimeSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.25.3.6 enum clock_rmii_src_k52d10_t

Enumerator

kClockRmiiSrcExtalClk EXTAL Clock.

kClockRmiiSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.25.3.7 enum clock_flexcan_src_k52d10_t

Enumerator

kClockFlexcanSrcOsc0erClk OSCERCLK.

kClockFlexcanSrcBusClk Bus clock.

SIM HAL driver

66.2.25.3.8 enum clock_sdhc_src_k52d10_t

Enumerator

kClockSdhcSrcCoreSysClk Core/system clock.
kClockSdhcSrcPllFllSel clock as selected by SOPT2[PLLFLLSEL].
kClockSdhcSrcOsc0erClk OSCERCLK clock.
kClockSdhcSrcExt External bypass clock (SDHC0_CLKIN)

66.2.25.3.9 enum clock_sai_src_k52d10_t

Enumerator

kClockSaiSrcSysClk SYSCLK.
kClockSaiSrcOsc0erClk OSC0ERCLK.
kClockSaiSrcPllClk MCGPLLCLK.

66.2.25.3.10 enum clock_tsi_active_mode_src_k52d10_t

Enumerator

kClockTsiActiveSrcBusClk Bus clock.
kClockTsiActiveSrcMcgIrClk MCG IRC clock.
kClockTsiActiveSrcOsc0erClk OSCERCLK clock.

66.2.25.3.11 enum clock_tsi_lp_mode_src_k52d10_t

Enumerator

kClockTsiLpSrcLpoClk LPO clock.
kClockTsiLpSrcEr32kClk ERCLK32K clock.

66.2.25.3.12 enum clock_pllfl_sel_k52d10_t

Enumerator

kClockPllFllSelFll Fll clock.
kClockPllFllSelPll Pll0 clock.

66.2.25.3.13 enum clock_er32k_src_k52d10_t

Enumerator

kClockEr32kSrcOsc0 OSC0 clock (OSC032KCLK).
kClockEr32kSrcRtc RTC 32k clock .
kClockEr32kSrcLpo LPO clock.

66.2.25.3.14 enum clock_clkout_src_k52d10_t

Enumerator

kClockClkoutSelFlexbusClk Flexbus clock.
kClockClkoutSelFlashClk Flash clock.
kClockClkoutSelLpoClk LPO clock.
kClockClkoutSelMcgIrClk MCG out clock.
kClockClkoutSelRtc32kClk RTC 32k clock.
kClockClkoutSelOsc0erClk OSCERCLK0 clock.

66.2.25.3.15 enum clock_rtcout_src_k52d10_t

Enumerator

kClockRtcoutSrc1Hz 1Hz clock
kClockRtcoutSrc32kHz 32kHz clock

66.2.25.3.16 enum sim_adc_pretrg_sel_k52d10_t

Enumerator

kSimAdcPretrgSelA Pre-trigger A selected for ADCx.
kSimAdcPretrgSelB Pre-trigger B selected for ADCx.

66.2.25.3.17 enum sim_adc_trg_sel_k52d10_t

Enumerator

kSimAdcTrgSelExt External trigger.
kSimAdcTrgSelHighSpeedComp0 High speed comparator 0 output.
kSimAdcTrgSelHighSpeedComp1 High speed comparator 1 output.
kSimAdcTrgSelHighSpeedComp2 High speed comparator 2 output.
kSimAdcTrgSelPit0 PIT trigger 0.
kSimAdcTrgSelPit1 PIT trigger 1.

SIM HAL driver

kSimAdcTrgSelPit2 PIT trigger 2.
kSimAdcTrgSelPit3 PIT trigger 3.
kSimAdcTrgSelFtm0 FTM0 trigger.
kSimAdcTrgSelFtm1 FTM1 trigger.
kSimAdcTrgSelFtm2 FTM2 trigger.
kSimAdcTrgSelRtcAlarm RTC alarm.
kSimAdcTrgSelRtcSec RTC seconds.
kSimAdcTrgSelLptimer Low-power timer trigger.

66.2.25.3.18 enum sim_uart_rxsrc_k52d10_t

Enumerator

kSimUartRxsrcPin UARTx_RX Pin.
kSimUartRxsrcCmp0 CMP0.
kSimUartRxsrcCmp1 CMP1.

66.2.25.3.19 enum sim_uart_txsrc_k52d10_t

Enumerator

kSimUartTxsrcPin UARTx_TX Pin.
kSimUartTxsrcFtm1 UARTx_TX pin modulated with FTM1 channel 0 output.
kSimUartTxsrcFtm2 UARTx_TX pin modulated with FTM2 channel 0 output.

66.2.25.3.20 enum sim_ftm_trg_src_k52d10_t

Enumerator

kSimFtmTrgSrc0 FlexTimer x trigger y select 0.
kSimFtmTrgSrc1 FlexTimer x trigger y select 1.

66.2.25.3.21 enum sim_ftm_clk_sel_k52d10_t

Enumerator

kSimFtmClkSel0 FTM CLKIN0 pin.
kSimFtmClkSel1 FTM CLKIN1 pin.

66.2.25.3.22 enum sim_ftm_ch_src_k52d10_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

66.2.25.3.23 enum sim_ftmflt_sel_k52d10_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

66.2.25.3.24 enum sim_tpm_clk_sel_k52d10_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM_CLKIN1 pin.

66.2.25.3.25 enum sim_tpm_ch_src_k52d10_t

Enumerator

- kSimTpmChSrc0* TPMx_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

66.2.25.3.26 enum sim_cmtuartpad_streng_h_k52d10_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0_TXD.

66.2.25.3.27 enum sim_ptd7pad_streng_h_k52d10_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

SIM HAL driver

66.2.25.3.28 enum sim_flexbus_security_level_k52d10_t

Enumerator

kSimFbslLevel0 FlexBus security level 0.

kSimFbslLevel1 FlexBus security level 1.

kSimFbslLevel2 FlexBus security level 2.

kSimFbslLevel3 FlexBus security level 3.

66.2.25.3.29 enum sim_clock_gate_name_k52d10_t

66.2.26 K53D10 SIM HAL driver

66.2.26.1 Overview

The section describes the enumerations, macros and data structures for K53D10 SIM HAL driver.

Files

- file [fsl_sim_hal_MK53D10.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k53d10_t](#) {
[kClockWdogSrcLpoClk](#),
[kClockWdogSrcAltClk](#) }
WDOG clock source select.
- enum [clock_trace_src_k53d10_t](#) {
[kClockTraceSrcMcgoutClk](#),
[kClockTraceSrcCoreClk](#) }
Debug trace clock source select.
- enum [clock_port_filter_src_k53d10_t](#) {
[kClockPortFilterSrcBusClk](#),
[kClockPortFilterSrcLpoClk](#) }
PORTx digital input filter clock source select.
- enum [clock_lptmr_src_k53d10_t](#) {
[kClockLptmrSrcMcgIrClk](#),
[kClockLptmrSrcLpoClk](#),
[kClockLptmrSrcEr32kClk](#),
[kClockLptmrSrcOsc0erClk](#) }
LPTMR clock source select.
- enum [clock_time_src_k53d10_t](#) {
[kClockTimeSrcCoreSysClk](#),
[kClockTimeSrcPIIFilSel](#),
[kClockTimeSrcOsc0erClk](#),
[kClockTimeSrcExt](#) }
SIM timestamp clock source.
- enum [clock_rmii_src_k53d10_t](#) {
[kClockRmiiSrcExtalClk](#),
[kClockRmiiSrcExt](#) }
SIM RMII clock source.

SIM HAL driver

- enum `clock_flexcan_src_k53d10_t` {
`kClockFlexcanSrcOsc0erClk`,
`kClockFlexcanSrcBusClk` }
FLEXCAN clock source select.
- enum `clock_sdhc_src_k53d10_t` {
`kClockSdhcSrcCoreSysClk`,
`kClockSdhcSrcPllFllSel`,
`kClockSdhcSrcOsc0erClk`,
`kClockSdhcSrcExt` }
SDHC clock source.
- enum `clock_sai_src_k53d10_t` {
`kClockSaiSrcSysClk` = 0U,
`kClockSaiSrcOsc0erClk` = 1U,
`kClockSaiSrcPllClk` = 3U }
SAI clock source.
- enum `clock_tsi_active_mode_src_k53d10_t` {
`kClockTsiActiveSrcBusClk`,
`kClockTsiActiveSrcMcgIrClk`,
`kClockTsiActiveSrcOsc0erClk` }
TSI Active Mode clock source.
- enum `clock_tsi_lp_mode_src_k53d10_t` {
`kClockTsiLpSrcLpoClk`,
`kClockTsiLpSrcEr32kClk` }
TSI Low-power Mode clock source.
- enum `clock_pllfl_sel_k53d10_t` {
`kClockPllFllSelFll` = 0U,
`kClockPllFllSelPll` = 1U }
SIM PLLFLLSEL clock source select.
- enum `clock_er32k_src_k53d10_t` {
`kClockEr32kSrcOsc0` = 0U,
`kClockEr32kSrcRtc` = 2U,
`kClockEr32kSrcLpo` = 3U }
SIM external reference clock source select (OSC32KSEL).
- enum `clock_clkout_src_k53d10_t` {
`kClockClkoutSelFlexbusClk` = 0U,
`kClockClkoutSelFlashClk` = 2U,
`kClockClkoutSelLpoClk` = 3U,
`kClockClkoutSelMcgIrClk` = 4U,
`kClockClkoutSelRtc32kClk` = 5U,
`kClockClkoutSelOsc0erClk` = 6U }
SIM CLKOUT_SEL clock source select.
- enum `clock_rtcout_src_k53d10_t` {
`kClockRtcoutSrc1Hz`,
`kClockRtcoutSrc32kHz` }
SIM RTCCLKOUTSEL clock source select.
- enum `sim_adc_pretrg_sel_k53d10_t` {
`kSimAdcPretrgselA`,

- kSimAdcPretrgSelB }
 - SIM ADCx pre-trigger select.*
- enum `sim_adc_trg_sel_k53d10_t` {
 - kSimAdcTrgSelExt = 0U,
 - kSimAdcTrgSelHighSpeedComp0 = 1U,
 - kSimAdcTrgSelHighSpeedComp1 = 2U,
 - kSimAdcTrgSelHighSpeedComp2 = 3U,
 - kSimAdcTrgSelPit0 = 4U,
 - kSimAdcTrgSelPit1 = 5U,
 - kSimAdcTrgSelPit2 = 6U,
 - kSimAdcTrgSelPit3 = 7U,
 - kSimAdcTrgSelFtm0 = 8U,
 - kSimAdcTrgSelFtm1 = 9U,
 - kSimAdcTrgSelFtm2 = 10U,
 - kSimAdcTrgSelRtcAlarm = 12U,
 - kSimAdcTrgSelRtcSec = 13U,
 - kSimAdcTrgSelLptimer = 14U }
 - SIM ADCx trigger select.*
- enum `sim_uart_rxsrc_k53d10_t` {
 - kSimUartRxsrcPin,
 - kSimUartRxsrcCmp0,
 - kSimUartRxsrcCmp1 }
 - SIM UART receive data source select.*
- enum `sim_uart_txsrc_k53d10_t` {
 - kSimUartTxsrcPin,
 - kSimUartTxsrcFtm1,
 - kSimUartTxsrcFtm2 }
 - SIM UART transmit data source select.*
- enum `sim_ftm_trg_src_k53d10_t` {
 - kSimFtmTrgSrc0,
 - kSimFtmTrgSrc1 }
 - SIM FlexTimer x trigger y select.*
- enum `sim_ftm_clk_sel_k53d10_t` {
 - kSimFtmClkSel0,
 - kSimFtmClkSel1 }
 - SIM FlexTimer external clock select.*
- enum `sim_ftm_ch_src_k53d10_t` {
 - kSimFtmChSrc0,
 - kSimFtmChSrc1,
 - kSimFtmChSrc2,
 - kSimFtmChSrc3 }
 - SIM FlexTimer x channel y input capture source select.*
- enum `sim_ftmflt_sel_k53d10_t` {
 - kSimFtmFltSel0,
 - kSimFtmFltSel1 }
 - SIM FlexTimer x Fault y select.*
- enum `sim_tpm_clk_sel_k53d10_t` {

SIM HAL driver

- `kSimTpmClkSel0,`
 - `kSimTpmClkSel1 }`

SIM Timer/PWM external clock select.
- enum `sim_tpm_ch_src_k53d10_t` {
 - `kSimTpmChSrc0,`
 - `kSimTpmChSrc1 }`

SIM Timer/PWM x channel y input capture source select.
- enum `sim_cmtuartpad_strength_k53d10_t` {
 - `kSimCmtuartSinglePad,`
 - `kSimCmtuartDualPad }`

SIM CMT/UART pad drive strength.
- enum `sim_ptd7pad_strength_k53d10_t` {
 - `kSimPtd7padSinglePad,`
 - `kSimPtd7padDualPad }`

SIM PTD7 pad drive strength.
- enum `sim_flexbus_security_level_k53d10_t` {
 - `kSimFbslLevel0,`
 - `kSimFbslLevel1,`
 - `kSimFbslLevel2,`
 - `kSimFbslLevel3 }`

SIM FlexBus security level.
- enum `sim_clock_gate_name_k53d10_t`

Clock gate name used for SIM_HAL_EnableClock/SIM_HAL_DisableClock.

66.2.26.2 Macro Definition Documentation

66.2.26.2.1 `#define FSL_SIM_SCGC_BIT(SCGCx, n) (((SCGCx-1U)<<5U) + n)`

66.2.26.3 Enumeration Type Documentation

66.2.26.3.1 enum `clock_wdog_src_k53d10_t`

Enumerator

- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for K53D10 it is Bus clock.

66.2.26.3.2 enum `clock_trace_src_k53d10_t`

Enumerator

- `kClockTraceSrcMcgoutClk` MCG out clock.
- `kClockTraceSrcCoreClk` core clock

66.2.26.3.3 enum clock_port_filter_src_k53d10_t

Enumerator

kClockPortFilterSrcBusClk Bus clock.
kClockPortFilterSrcLpoClk LPO.

66.2.26.3.4 enum clock_lptmr_src_k53d10_t

Enumerator

kClockLptmrSrcMcgIrClk MCG IRC clock.
kClockLptmrSrcLpoClk LPO clock.
kClockLptmrSrcEr32kClk ERCLK32K clock.
kClockLptmrSrcOsc0erClk OSCERCLK clock.

66.2.26.3.5 enum clock_time_src_k53d10_t

Enumerator

kClockTimeSrcCoreSysClk Core/system clock.
kClockTimeSrcPllFllSel clock as selected by SOPT2[PLLFLLSSEL].
kClockTimeSrcOsc0erClk OSCERCLK clock.
kClockTimeSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.26.3.6 enum clock_rmii_src_k53d10_t

Enumerator

kClockRmiiSrcExtalClk EXTAL Clock.
kClockRmiiSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.26.3.7 enum clock_flexcan_src_k53d10_t

Enumerator

kClockFlexcanSrcOsc0erClk OSCERCLK.
kClockFlexcanSrcBusClk Bus clock.

SIM HAL driver

66.2.26.3.8 enum clock_sdhc_src_k53d10_t

Enumerator

- kClockSdhcSrcCoreSysClk* Core/system clock.
- kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLLSEL].
- kClockSdhcSrcOsc0erClk* OSCERCLK clock.
- kClockSdhcSrcExt* External bypass clock (SDHC0_CLKIN)

66.2.26.3.9 enum clock_sai_src_k53d10_t

Enumerator

- kClockSaiSrcSysClk* SYSCLK.
- kClockSaiSrcOsc0erClk* OSC0ERCLK.
- kClockSaiSrcPllClk* MCGPLLCLK.

66.2.26.3.10 enum clock_tsi_active_mode_src_k53d10_t

Enumerator

- kClockTsiActiveSrcBusClk* Bus clock.
- kClockTsiActiveSrcMcgIrClk* MCG IRC clock.
- kClockTsiActiveSrcOsc0erClk* OSCERCLK clock.

66.2.26.3.11 enum clock_tsi_lp_mode_src_k53d10_t

Enumerator

- kClockTsiLpSrcLpoClk* LPO clock.
- kClockTsiLpSrcEr32kClk* ERCLK32K clock.

66.2.26.3.12 enum clock_pllfl_sel_k53d10_t

Enumerator

- kClockPllFllSelFll* Fll clock.
- kClockPllFllSelPll* Pll0 clock.

66.2.26.3.13 enum clock_er32k_src_k53d10_t

Enumerator

kClockEr32kSrcOsc0 OSC0 clock (OSC032KCLK).
kClockEr32kSrcRtc RTC 32k clock .
kClockEr32kSrcLpo LPO clock.

66.2.26.3.14 enum clock_clkout_src_k53d10_t

Enumerator

kClockClkoutSelFlexbusClk Flexbus clock.
kClockClkoutSelFlashClk Flash clock.
kClockClkoutSelLpoClk LPO clock.
kClockClkoutSelMcgIrClk MCG out clock.
kClockClkoutSelRtc32kClk RTC 32k clock.
kClockClkoutSelOsc0erClk OSCERCLK0 clock.

66.2.26.3.15 enum clock_rtcout_src_k53d10_t

Enumerator

kClockRtcoutSrc1Hz 1Hz clock
kClockRtcoutSrc32kHz 32kHz clock

66.2.26.3.16 enum sim_adc_pretrg_sel_k53d10_t

Enumerator

kSimAdcPretrgSelA Pre-trigger A selected for ADCx.
kSimAdcPretrgSelB Pre-trigger B selected for ADCx.

66.2.26.3.17 enum sim_adc_trg_sel_k53d10_t

Enumerator

kSimAdcTrgSelExt External trigger.
kSimAdcTrgSelHighSpeedComp0 High speed comparator 0 output.
kSimAdcTrgSelHighSpeedComp1 High speed comparator 1 output.
kSimAdcTrgSelHighSpeedComp2 High speed comparator 2 output.
kSimAdcTrgSelPit0 PIT trigger 0.
kSimAdcTrgSelPit1 PIT trigger 1.

SIM HAL driver

kSimAdcTrgSelPit2 PIT trigger 2.
kSimAdcTrgSelPit3 PIT trigger 3.
kSimAdcTrgSelFtm0 FTM0 trigger.
kSimAdcTrgSelFtm1 FTM1 trigger.
kSimAdcTrgSelFtm2 FTM2 trigger.
kSimAdcTrgSelRtcAlarm RTC alarm.
kSimAdcTrgSelRtcSec RTC seconds.
kSimAdcTrgSelLptimer Low-power timer trigger.

66.2.26.3.18 enum sim_uart_rxsrc_k53d10_t

Enumerator

kSimUartRxsrcPin UARTx_RX Pin.
kSimUartRxsrcCmp0 CMP0.
kSimUartRxsrcCmp1 CMP1.

66.2.26.3.19 enum sim_uart_txsrc_k53d10_t

Enumerator

kSimUartTxsrcPin UARTx_TX Pin.
kSimUartTxsrcFtm1 UARTx_TX pin modulated with FTM1 channel 0 output.
kSimUartTxsrcFtm2 UARTx_TX pin modulated with FTM2 channel 0 output.

66.2.26.3.20 enum sim_ftm_trg_src_k53d10_t

Enumerator

kSimFtmTrgSrc0 FlexTimer x trigger y select 0.
kSimFtmTrgSrc1 FlexTimer x trigger y select 1.

66.2.26.3.21 enum sim_ftm_clk_sel_k53d10_t

Enumerator

kSimFtmClkSel0 FTM CLKIN0 pin.
kSimFtmClkSel1 FTM CLKIN1 pin.

66.2.26.3.22 enum sim_ftm_ch_src_k53d10_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

66.2.26.3.23 enum sim_ftmflt_sel_k53d10_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

66.2.26.3.24 enum sim_tpm_clk_sel_k53d10_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM_CLKIN1 pin.

66.2.26.3.25 enum sim_tpm_ch_src_k53d10_t

Enumerator

- kSimTpmChSrc0* TPMx_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

66.2.26.3.26 enum sim_cmtuartpad_streng_h_k53d10_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0_TXD.

66.2.26.3.27 enum sim_ptd7pad_streng_h_k53d10_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

SIM HAL driver

66.2.26.3.28 enum sim_flexbus_security_level_k53d10_t

Enumerator

kSimFbslLevel0 FlexBus security level 0.

kSimFbslLevel1 FlexBus security level 1.

kSimFbslLevel2 FlexBus security level 2.

kSimFbslLevel3 FlexBus security level 3.

66.2.26.3.29 enum sim_clock_gate_name_k53d10_t

66.2.27 K60D10 SIM HAL driver

66.2.27.1 Overview

The section describes the enumerations, macros and data structures for K60D10 SIM HAL driver.

Files

- file [fsl_sim_hal_MK60D10.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k60d10_t](#) {
[kClockWdogSrcLpoClk](#),
[kClockWdogSrcAltClk](#) }
WDOG clock source select.
- enum [clock_trace_src_k60d10_t](#) {
[kClockTraceSrcMcgoutClk](#),
[kClockTraceSrcCoreClk](#) }
Debug trace clock source select.
- enum [clock_port_filter_src_k60d10_t](#) {
[kClockPortFilterSrcBusClk](#),
[kClockPortFilterSrcLpoClk](#) }
PORTx digital input filter clock source select.
- enum [clock_lptmr_src_k60d10_t](#) {
[kClockLptmrSrcMcgIrClk](#),
[kClockLptmrSrcLpoClk](#),
[kClockLptmrSrcEr32kClk](#),
[kClockLptmrSrcOsc0erClk](#) }
LPTMR clock source select.
- enum [clock_time_src_k60d10_t](#) {
[kClockTimeSrcCoreSysClk](#),
[kClockTimeSrcPIIFilSel](#),
[kClockTimeSrcOsc0erClk](#),
[kClockTimeSrcExt](#) }
SIM timestamp clock source.
- enum [clock_rmii_src_k60d10_t](#) {
[kClockRmiiSrcExtalClk](#),
[kClockRmiiSrcExt](#) }
SIM RMII clock source.

SIM HAL driver

- enum `clock_flexcan_src_k60d10_t` {
`kClockFlexcanSrcOsc0erClk`,
`kClockFlexcanSrcBusClk` }
FLEXCAN clock source select.
- enum `clock_sdhc_src_k60d10_t` {
`kClockSdhcSrcCoreSysClk`,
`kClockSdhcSrcPllFllSel`,
`kClockSdhcSrcOsc0erClk`,
`kClockSdhcSrcExt` }
SDHC clock source.
- enum `clock_sai_src_k60d10_t` {
`kClockSaiSrcSysClk` = 0U,
`kClockSaiSrcOsc0erClk` = 1U,
`kClockSaiSrcPllClk` = 3U }
SAI clock source.
- enum `clock_tsi_active_mode_src_k60d10_t` {
`kClockTsiActiveSrcBusClk`,
`kClockTsiActiveSrcMcgIrClk`,
`kClockTsiActiveSrcOsc0erClk` }
TSI Active Mode clock source.
- enum `clock_tsi_lp_mode_src_k60d10_t` {
`kClockTsiLpSrcLpoClk`,
`kClockTsiLpSrcEr32kClk` }
TSI Low-power Mode clock source.
- enum `clock_pllfl_sel_k60d10_t` {
`kClockPllFllSelFll` = 0U,
`kClockPllFllSelPll` = 1U }
SIM PLLFLLSEL clock source select.
- enum `clock_er32k_src_k60d10_t` {
`kClockEr32kSrcOsc0` = 0U,
`kClockEr32kSrcRtc` = 2U,
`kClockEr32kSrcLpo` = 3U }
SIM external reference clock source select (OSC32KSEL).
- enum `clock_clkout_src_k60d10_t` {
`kClockClkoutSelFlexbusClk` = 0U,
`kClockClkoutSelFlashClk` = 2U,
`kClockClkoutSelLpoClk` = 3U,
`kClockClkoutSelMcgIrClk` = 4U,
`kClockClkoutSelRtc32kClk` = 5U,
`kClockClkoutSelOsc0erClk` = 6U }
SIM CLKOUT_SEL clock source select.
- enum `clock_rtcout_src_k60d10_t` {
`kClockRtcoutSrc1Hz`,
`kClockRtcoutSrc32kHz` }
SIM RTCCLKOUTSEL clock source select.
- enum `sim_adc_pretrg_sel_k60d10_t` {
`kSimAdcPretrgSelA`,

- ```

kSimAdcPretrgSelB }
 SIM ADCx pre-trigger select.
• enum sim_adc_trg_sel_k60d10_t {
 kSimAdcTrgSelExt = 0U,
 kSimAdcTrgSelHighSpeedComp0 = 1U,
 kSimAdcTrgSelHighSpeedComp1 = 2U,
 kSimAdcTrgSelHighSpeedComp2 = 3U,
 kSimAdcTrgSelPit0 = 4U,
 kSimAdcTrgSelPit1 = 5U,

 kSimAdcTrgSelLptimer = 14U }
 SIM ADCx trigger select.
• enum sim_uart_rxsrc_k60d10_t {
 kSimUartRxsrcPin,
 kSimUartRxsrcCmp0,
 kSimUartRxsrcCmp1 }
 SIM UART receive data source select.
• enum sim_uart_txsrc_k60d10_t {
 kSimUartTxsrcPin,
 kSimUartTxsrcFtm1,
 kSimUartTxsrcFtm2 }
 SIM UART transmit data source select.
• enum sim_ftm_trg_src_k60d10_t {
 kSimFtmTrgSrc0,
 kSimFtmTrgSrc1 }
 SIM FlexTimer x trigger y select.
• enum sim_ftm_clk_sel_k60d10_t {
 kSimFtmClkSel0,
 kSimFtmClkSel1 }
 SIM FlexTimer external clock select.
• enum sim_ftm_ch_src_k60d10_t {
 kSimFtmChSrc0,
 kSimFtmChSrc1,
 kSimFtmChSrc2,
 kSimFtmChSrc3 }
 SIM FlexTimer x channel y input capture source select.
• enum sim_ftmflt_sel_k60d10_t {
 kSimFtmFltSel0,
 kSimFtmFltSel1 }
 SIM FlexTimer x Fault y select.
• enum sim_tpm_clk_sel_k60d10_t {

```

## SIM HAL driver

- `kSimTpmClkSel0,`
  - `kSimTpmClkSel1 }`

*SIM Timer/PWM external clock select.*
- enum `sim_tpm_ch_src_k60d10_t` {
  - `kSimTpmChSrc0,`
  - `kSimTpmChSrc1 }`

*SIM Timer/PWM x channel y input capture source select.*
- enum `sim_cmtuartpad_strength_k60d10_t` {
  - `kSimCmtuartSinglePad,`
  - `kSimCmtuartDualPad }`

*SIM CMT/UART pad drive strength.*
- enum `sim_ptd7pad_strength_k60d10_t` {
  - `kSimPtd7padSinglePad,`
  - `kSimPtd7padDualPad }`

*SIM PTD7 pad drive strength.*
- enum `sim_flexbus_security_level_k60d10_t` {
  - `kSimFbslLevel0,`
  - `kSimFbslLevel1,`
  - `kSimFbslLevel2,`
  - `kSimFbslLevel3 }`

*SIM FlexBus security level.*
- enum `sim_clock_gate_name_k60d10_t`

*Clock gate name used for SIM\_HAL\_EnableClock/SIM\_HAL\_DisableClock.*

### 66.2.27.2 Macro Definition Documentation

66.2.27.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.27.3 Enumeration Type Documentation

#### 66.2.27.3.1 enum `clock_wdog_src_k60d10_t`

Enumerator

- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for K60D10 it is Bus clock.

#### 66.2.27.3.2 enum `clock_trace_src_k60d10_t`

Enumerator

- `kClockTraceSrcMcgoutClk` MCG out clock.
- `kClockTraceSrcCoreClk` core clock

### 66.2.27.3.3 enum clock\_port\_filter\_src\_k60d10\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.27.3.4 enum clock\_lptmr\_src\_k60d10\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.27.3.5 enum clock\_time\_src\_k60d10\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.  
*kClockTimeSrcPllFllSel* clock as selected by SOPT2[PLLFLLSSEL].  
*kClockTimeSrcOsc0erClk* OSCERCLK clock.  
*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.27.3.6 enum clock\_rmii\_src\_k60d10\_t

Enumerator

*kClockRmiiSrcExtalClk* EXTAL Clock.  
*kClockRmiiSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.27.3.7 enum clock\_flexcan\_src\_k60d10\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

## SIM HAL driver

### 66.2.27.3.8 enum clock\_sdhc\_src\_k60d10\_t

Enumerator

- kClockSdhcSrcCoreSysClk* Core/system clock.
- kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLLSEL].
- kClockSdhcSrcOsc0erClk* OSCERCLK clock.
- kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.27.3.9 enum clock\_sai\_src\_k60d10\_t

Enumerator

- kClockSaiSrcSysClk* SYSCLK.
- kClockSaiSrcOsc0erClk* OSC0ERCLK.
- kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.27.3.10 enum clock\_tsi\_active\_mode\_src\_k60d10\_t

Enumerator

- kClockTsiActiveSrcBusClk* Bus clock.
- kClockTsiActiveSrcMcgIrClk* MCG IRC clock.
- kClockTsiActiveSrcOsc0erClk* OSCERCLK clock.

### 66.2.27.3.11 enum clock\_tsi\_lp\_mode\_src\_k60d10\_t

Enumerator

- kClockTsiLpSrcLpoClk* LPO clock.
- kClockTsiLpSrcEr32kClk* ERCLK32K clock.

### 66.2.27.3.12 enum clock\_pllfl\_sel\_k60d10\_t

Enumerator

- kClockPllFllSelFll* Fll clock.
- kClockPllFllSelPll* Pll0 clock.

### 66.2.27.3.13 enum clock\_er32k\_src\_k60d10\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.27.3.14 enum clock\_clkout\_src\_k60d10\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelRtc32kClk* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.27.3.15 enum clock\_rtcout\_src\_k60d10\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

### 66.2.27.3.16 enum sim\_adc\_pretrg\_sel\_k60d10\_t

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

### 66.2.27.3.17 enum sim\_adc\_trg\_sel\_k60d10\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.

## SIM HAL driver

*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.27.3.18 enum sim\_uart\_rxsrc\_k60d10\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

### 66.2.27.3.19 enum sim\_uart\_txsrc\_k60d10\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.27.3.20 enum sim\_ftm\_trg\_src\_k60d10\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.27.3.21 enum sim\_ftm\_clk\_sel\_k60d10\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

**66.2.27.3.22 enum sim\_ftm\_ch\_src\_k60d10\_t**

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

**66.2.27.3.23 enum sim\_ftmflt\_sel\_k60d10\_t**

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.27.3.24 enum sim\_tpm\_clk\_sel\_k60d10\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.27.3.25 enum sim\_tpm\_ch\_src\_k60d10\_t**

Enumerator

- kSimTpmChSrc0* TPMx\_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

**66.2.27.3.26 enum sim\_cmtuartpad\_streng\_h\_k60d10\_t**

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

**66.2.27.3.27 enum sim\_ptd7pad\_streng\_h\_k60d10\_t**

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

## SIM HAL driver

### 66.2.27.3.28 enum sim\_flexbus\_security\_level\_k60d10\_t

Enumerator

*kSimFbslLevel0* FlexBus security level 0.

*kSimFbslLevel1* FlexBus security level 1.

*kSimFbslLevel2* FlexBus security level 2.

*kSimFbslLevel3* FlexBus security level 3.

### 66.2.27.3.29 enum sim\_clock\_gate\_name\_k60d10\_t

## 66.2.28 K63F12 SIM HAL driver

### 66.2.28.1 Overview

The section describes the enumerations, macros and data structures for K63F12 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK63F12.h](#)

#### Macros

### 66.2.28.2 Macro Definition Documentation

66.2.28.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.28.3 Enumeration Type Documentation

66.2.28.3.1 enum `clock_wdog_src_k63f12_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for MK63F12 it is Bus clock.

### 66.2.28.3.2 enum clock\_trace\_src\_k63f12\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.  
*kClockTraceSrcCoreClk* core clock

### 66.2.28.3.3 enum clock\_port\_filter\_src\_k63f12\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.28.3.4 enum clock\_lptmr\_src\_k63f12\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.28.3.5 enum clock\_time\_src\_k63f12\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.  
*kClockTimeSrcPlfllSel* clock as selected by SOPT2[PLLFLLSSEL].  
*kClockTimeSrcOsc0erClk* OSCERCLK clock.  
*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.28.3.6 enum clock\_rmii\_src\_k63f12\_t

Enumerator

*kClockRmiiSrcExtalClk* EXTAL Clock.  
*kClockRmiiSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.28.3.7 enum clock\_usbfs\_src\_k63f12\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPlfllSel* Clock divider USB FS clock.

## SIM HAL driver

### 66.2.28.3.8 enum clock\_flexcan\_src\_k63f12\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

### 66.2.28.3.9 enum clock\_sdhc\_src\_k63f12\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.28.3.10 enum clock\_sai\_src\_k63f12\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.28.3.11 enum clock\_pllfl\_sel\_k63f12\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.  
*kClockPllFllSelIrc48M* IRC48MCLK.

### 66.2.28.3.12 enum clock\_er32k\_src\_k63f12\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

**66.2.28.3.13 enum clock\_clkout\_src\_k63f12\_t**

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

**66.2.28.3.14 enum clock\_rtcout\_src\_k63f12\_t**

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

**66.2.28.3.15 enum sim\_usbsstby\_mode\_k63f12\_t**

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

**66.2.28.3.16 enum sim\_usbvstby\_mode\_k63f12\_t**

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

**66.2.28.3.17 enum sim\_adc\_pretrg\_sel\_k63f12\_t**

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

## SIM HAL driver

### 66.2.28.3.18 enum sim\_adc\_trg\_sel\_k63f12\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelFtm3* FTM3 trigger.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.28.3.19 enum sim\_uart\_rxsrc\_k63f12\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

### 66.2.28.3.20 enum sim\_uart\_txsrc\_k63f12\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.28.3.21 enum sim\_ftm\_trg\_src\_k63f12\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

**66.2.28.3.22 enum sim\_ftm\_clk\_sel\_k63f12\_t**

Enumerator

- kSimFtmClkSel0* FTM CLKIN0 pin.
- kSimFtmClkSel1* FTM CLKIN1 pin.

**66.2.28.3.23 enum sim\_ftm\_ch\_src\_k63f12\_t**

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

**66.2.28.3.24 enum sim\_ftmflt\_sel\_k63f12\_t**

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.28.3.25 enum sim\_tpm\_clk\_sel\_k63f12\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.28.3.26 enum sim\_tpm\_ch\_src\_k63f12\_t**

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

**66.2.28.3.27 enum sim\_cmtuartpad\_strength\_k63f12\_t**

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

## SIM HAL driver

### 66.2.28.3.28 enum sim\_ptd7pad\_strength\_k63f12\_t

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.

*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### 66.2.28.3.29 enum sim\_flexbus\_security\_level\_k63f12\_t

Enumerator

*kSimFbslLevel0* FlexBus security level 0.

*kSimFbslLevel1* FlexBus security level 1.

*kSimFbslLevel2* FlexBus security level 2.

*kSimFbslLevel3* FlexBus security level 3.

### 66.2.28.3.30 enum sim\_clock\_gate\_name\_k63f12\_t

## 66.2.29 K64F12 SIM HAL driver

### 66.2.29.1 Overview

The section describes the enumerations, macros and data structures for K64F12 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK64F12.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k64f12\\_t](#) {  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_k64f12\\_t](#) {  
[kClockTraceSrcMcgoutClk](#),  
[kClockTraceSrcCoreClk](#) }  
*Debug trace clock source select.*
- enum [clock\\_port\\_filter\\_src\\_k64f12\\_t](#) {  
[kClockPortFilterSrcBusClk](#),  
[kClockPortFilterSrcLpoClk](#) }  
*PORTx digital input filter clock source select.*
- enum [clock\\_lptmr\\_src\\_k64f12\\_t](#) {  
[kClockLptmrSrcMcgIrClk](#),  
[kClockLptmrSrcLpoClk](#),  
[kClockLptmrSrcEr32kClk](#),  
[kClockLptmrSrcOsc0erClk](#) }  
*LPTMR clock source select.*
- enum [clock\\_time\\_src\\_k64f12\\_t](#) {  
[kClockTimeSrcCoreSysClk](#),  
[kClockTimeSrcPIIFilSel](#),  
[kClockTimeSrcOsc0erClk](#),  
[kClockTimeSrcExt](#) }  
*SIM timestamp clock source.*
- enum [clock\\_rmii\\_src\\_k64f12\\_t](#) {  
[kClockRmiiSrcExtalClk](#),  
[kClockRmiiSrcExt](#) }  
*SIM RMII clock source.*

**66.2.29.3.15 enum sim\_usbsstby\_mode\_k64f12\_t**

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

**66.2.29.3.16 enum sim\_usbvstby\_mode\_k64f12\_t**

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

**66.2.29.3.17 enum sim\_adc\_pretrg\_sel\_k64f12\_t**

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

## SIM HAL driver

### 66.2.29.3.18 enum sim\_adc\_trg\_sel\_k64f12\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelFtm3* FTM3 trigger.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.29.3.19 enum sim\_uart\_rxsrc\_k64f12\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

### 66.2.29.3.20 enum sim\_uart\_txsrc\_k64f12\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.29.3.21 enum sim\_ftm\_trg\_src\_k64f12\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

**66.2.29.3.22 enum sim\_ftm\_clk\_sel\_k64f12\_t**

Enumerator

- kSimFtmClkSel0* FTM CLKIN0 pin.
- kSimFtmClkSel1* FTM CLKIN1 pin.

**66.2.29.3.23 enum sim\_ftm\_ch\_src\_k64f12\_t**

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

**66.2.29.3.24 enum sim\_ftmflt\_sel\_k64f12\_t**

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.29.3.25 enum sim\_tpm\_clk\_sel\_k64f12\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.29.3.26 enum sim\_tpm\_ch\_src\_k64f12\_t**

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

**66.2.29.3.27 enum sim\_cmtuartpad\_strength\_k64f12\_t**

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

## SIM HAL driver

### 66.2.29.3.28 enum sim\_ptd7pad\_strength\_k64f12\_t

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.

*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### 66.2.29.3.29 enum sim\_flexbus\_security\_level\_k64f12\_t

Enumerator

*kSimFbslLevel0* FlexBus security level 0.

*kSimFbslLevel1* FlexBus security level 1.

*kSimFbslLevel2* FlexBus security level 2.

*kSimFbslLevel3* FlexBus security level 3.

### 66.2.29.3.30 enum sim\_clock\_gate\_name\_k64f12\_t

## 66.2.30 K65F18 SIM HAL driver

### 66.2.30.1 Overview

The section describes the enumerations, macros and data structures for K65F18 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK65F18.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k65f18\\_t](#) {  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_k65f18\\_t](#) {  
[kClockTraceSrcMcgoutClkDiv](#),  
[kClockTraceSrcCoreClk](#) }  
*Debug trace clock source select.*
- enum [clock\\_port\\_filter\\_src\\_k65f18\\_t](#) {  
[kClockPortFilterSrcBusClk](#),  
[kClockPortFilterSrcLpoClk](#) }  
*PORTx digital input filter clock source select.*
- enum [clock\\_tpm\\_src\\_k65f18\\_t](#) {  
[kClockTpmSrcNone](#),  
[kClockTpmSrcPllFllSelDiv](#),  
[kClockTpmSrcOsc0erClk](#),  
[kClockTpmSrcMcgIrClk](#) }  
*TPM clock source select.*
- enum [clock\\_lptmr\\_src\\_k65f18\\_t](#) {  
[kClockLptmrSrcMcgIrClk](#),  
[kClockLptmrSrcLpoClk](#),  
[kClockLptmrSrcEr32kClk](#),  
[kClockLptmrSrcOsc0erClkUndiv](#) }  
*LPTMR clock source select.*
- enum [clock\\_lpuart\\_src\\_k65f18\\_t](#) {  
[kClockLpuartSrcNone](#),  
[kClockLpuartSrcPllFllSel](#),  
[kClockLpuartSrcOsc0erClk](#),

## SIM HAL driver

66.2.30.2 Macro Definition Documentation

66.2.30.2.1 `#define FSL_SIM_SCGC_BIT(SCGCx, n) (((SCGCx-1U)<<5U) + n)`

66.2.30.3 Enumeration Type Documentation

66.2.30.3.1 `enum clock_wdog_src_k65f18_t`

Enumerator

kClockWdogSrcLpoClk LPO.

kClockWdogSrcAltClk Alternative clock, for this SOC it is Bus clock.

SIM HAL driver

66.2.30.3.2 enum clock_trace_src_k65f18_t

Enumerator

kClockTraceSrcMcgoutClkDiv MCG out clock divided by the fractional divider configured by SIM_CLKDIV4[TRACEFRAC, TRACEDIV].
kClockTraceSrcCoreClk core clock

66.2.30.3.3 enum clock_port_filter_src_k65f18_t

Enumerator

kClockPortFilterSrcBusClk Bus clock.
kClockPortFilterSrcLpoClk LPO.

66.2.30.3.4 enum clock_tpm_src_k65f18_t

Enumerator

kClockTpmSrcNone clock disabled
kClockTpmSrcPllFllSelDiv clock as selected by SOPT2[PLLFLLSEL] and divided by the fractional divider configured by SIM_CLKDIV3[PLLFLLFRAC, PLLFLLDIV].
kClockTpmSrcOsc0erClk OSCERCLK clock.
kClockTpmSrcMcgIrClk MCGIR clock.

66.2.30.3.5 enum clock_lptmr_src_k65f18_t

Enumerator

kClockLptmrSrcMcgIrClk MCGIRCLK.
kClockLptmrSrcLpoClk LPO clock.
kClockLptmrSrcEr32kClk ERCLK32K clock.
kClockLptmrSrcOsc0erClkUndiv OSCERCLK_UNDIV clock.

66.2.30.3.6 enum clock_lpuart_src_k65f18_t

Enumerator

kClockLpuartSrcNone Clock disabled.
kClockLpuartSrcPllFllSel Clock as selected by SOPT2[PLLFLLSEL].
kClockLpuartSrcOsc0erClk OSCERCLK.
kClockLpuartSrcMcgIrClk MCGIRCLK.

66.2.30.3.7 enum sim_lpuart_rxsrc_k65f18_t

Enumerator

kSimLpuartRxsrcPin LPUARTx_RX Pin.
kSimLpuartRxsrcCmp0 CMP0.
kSimLpuartRxsrcCmp1 CMP1.

66.2.30.3.8 enum sim_lpuart_txsrc_k65f18_t

Enumerator

kSimLpuartTxsrcPin UARTx_TX Pin.
kSimLpuartTxsrcTpm1 UARTx_TX pin modulated with TPM1 channel 0 output.
kSimLpuartTxsrcTpm2 UARTx_TX pin modulated with TPM2 channel 0 output.

66.2.30.3.9 enum clock_time_src_k65f18_t

Enumerator

kClockTimeSrcCoreSysClk Core/system clock.
kClockTimeSrcPllFllSel clock as selected by SOPT2[PLLFLSEL].
kClockTimeSrcOsc0erClk OSCERCLK clock.
kClockTimeSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.30.3.10 enum clock_rmii_src_k65f18_t

Enumerator

kClockRmiiSrcExtalClk EXTAL Clock.
kClockRmiiSrcExt ENET 1588 clock in (ENET_1588_CLKIN)

66.2.30.3.11 enum clock_usbfs_src_k65f18_t

Enumerator

kClockUsbfsSrcExt External bypass clock (USB_CLKIN)
kClockUsbfsSrcPllFllSel Clock divider USB FS clock.

66.2.30.3.12 enum clock_flexcan_src_k65f18_t

Enumerator

kClockFlexcanSrcOsc0erClk OSCERCLK.
kClockFlexcanSrcBusClk Bus clock.

SIM HAL driver

66.2.30.3.13 enum clock_sdhc_src_k65f18_t

Enumerator

kClockSdhcSrcCoreSysClk Core/system clock.
kClockSdhcSrcPllFllSel clock as selected by SOPT2[PLLFLSEL].
kClockSdhcSrcOsc0erClk OSCERCLK clock.
kClockSdhcSrcExt External bypass clock (SDHC0_CLKIN)

66.2.30.3.14 enum clock_sai_src_k65f18_t

Enumerator

kClockSaiSrcSysClk SYSCLK.
kClockSaiSrcOsc0erClk OSC0ERCLK.
kClockSaiSrcPllFllSel MCGPLLFLCLK.

66.2.30.3.15 enum clock_pllfl_sel_k65f18_t

Enumerator

kClockPllFllSelFll Fll clock.
kClockPllFllSelPll Pll0 clock.
kClockPllFllSelUsb1pfd USB1 PFD clock.
kClockPllFllSelIrc48M IRC48MCLK.

66.2.30.3.16 enum clock_er32k_src_k65f18_t

Enumerator

kClockEr32kSrcOsc0 OSC0 clock (OSC032KCLK).
kClockEr32kSrcRtc RTC 32k clock .
kClockEr32kSrcLpo LPO clock.

66.2.30.3.17 enum clock_clkout_src_k65f18_t

Enumerator

kClockClkoutSelFlexbusClk Flexbus clock.
kClockClkoutSelFlashClk Flash clock.
kClockClkoutSelLpoClk LPO clock.
kClockClkoutSelMcgIrClk MCGIRCLK.
kClockClkoutSelRtc RTC 32k clock.
kClockClkoutSelOsc0erClk OSC0ERCLK.
kClockClkoutSelIrc48M IRC48MCLK.

66.2.30.3.18 enum clock_rtcout_src_k65f18_t

Enumerator

kClockRtcoutSrc1Hz 1Hz clock
kClockRtcoutSrc32kHz 32kHz clock

66.2.30.3.19 enum clock_usbhs_slowclk_src_k65f18_t

Enumerator

kClockUsbhsSlowClkSrcMcgIrClk MCGIRCLK clock.
kClockUsbhsSlowClkSrcRtc32kHz RTC 32kHz clock.

66.2.30.3.20 enum sim_usbsstby_mode_k65f18_t

Enumerator

kSimUsbsstbyNoRegulator regulator not in standby during Stop modes
kSimUsbsstbyWithRegulator regulator in standby during Stop modes

66.2.30.3.21 enum sim_usbvstby_mode_k65f18_t

Enumerator

kSimUsbvstbyNoRegulator regulator not in standby during VLPR and VLPW modes
kSimUsbvstbyWithRegulator regulator in standby during VLPR and VLPW modes

66.2.30.3.22 enum sim_usbvout_mode_k65f18_t

Enumerator

kSimUsbvout2_733V USB 3V regulator output voltage set to 2.733V.
kSimUsbvout3_020V USB 3V regulator output voltage set to 3.020V.
kSimUsbvout3_074V USB 3V regulator output voltage set to 3.074V.
kSimUsbvout3_130V USB 3V regulator output voltage set to 3.130V.
kSimUsbvout3_188V USB 3V regulator output voltage set to 3.188V.
kSimUsbvout3_248V USB 3V regulator output voltage set to 3.248V.
kSimUsbvout3_310V USB 3V regulator output voltage set to 3.310V.

SIM HAL driver

66.2.30.3.23 enum sim_adc_pretrg_sel_k65f18_t

Enumerator

kSimAdcPretrgSelA Pre-trigger A selected for ADCx.

kSimAdcPretrgSelB Pre-trigger B selected for ADCx.

66.2.30.3.24 enum sim_adc_trg_sel_k65f18_t

Enumerator

kSimAdcTrgSelExt External trigger.

kSimAdcTrgSelHighSpeedComp0 High speed comparator 0 output.

kSimAdcTrgSelHighSpeedComp1 High speed comparator 1 output.

kSimAdcTrgSelHighSpeedComp2 High speed comparator 2 output.

kSimAdcTrgSelPit0 PIT trigger 0.

kSimAdcTrgSelPit1 PIT trigger 1.

kSimAdcTrgSelPit2 PIT trigger 2.

kSimAdcTrgSelPit3 PIT trigger 3.

kSimAdcTrgSelFtm0 FTM0 trigger.

kSimAdcTrgSelFtm1 FTM1 trigger.

kSimAdcTrgSelFtm2 FTM2 trigger.

kSimAdcTrgSelFtm3 FTM3 trigger.

kSimAdcTrgSelRtcAlarm RTC alarm.

kSimAdcTrgSelRtcSec RTC seconds.

kSimAdcTrgSelLptimer Low-power timer trigger.

kSimAdcTrgSelTpm TPMx channel 0 (A pretrigger) and channel 1 (B pretrigger)

66.2.30.3.25 enum sim_uart_rxsrc_k65f18_t

Enumerator

kSimUartRxsrcPin UARTx_RX Pin.

kSimUartRxsrcCmp0 CMP0.

kSimUartRxsrcCmp1 CMP1.

66.2.30.3.26 enum sim_uart_txsrc_k65f18_t

Enumerator

kSimUartTxsrcPin UARTx_TX Pin.

kSimUartTxsrcFtm1 UARTx_TX pin modulated with FTM1 channel 0 output.

kSimUartTxsrcFtm2 UARTx_TX pin modulated with FTM2 channel 0 output.

Enumerator

kSimTpmClkSel0 Timer/PWM TPM_CLKIN0 pin.*kSimTpmClkSel1* Timer/PWM TPM_CLKIN1 pin.

SIM HAL driver

66.2.30.3.33 enum sim_tpm_ch_src_k65f18_t

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

66.2.30.3.34 enum sim_cmtuartpad_strength_k65f18_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0_TXD.

66.2.30.3.35 enum sim_ptd7pad_strength_k65f18_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

66.2.30.3.36 enum sim_flexbus_security_level_k65f18_t

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

66.2.30.3.37 enum sim_clock_gate_name_k65f18_t

66.2.31 K66F18 SIM HAL driver

66.2.31.1 Overview

The section describes the enumerations, macros and data structures for K66F18 SIM HAL driver.

Files

- file [fsl_sim_hal_MK66F18.h](#)

Macros

- #define [FSL_SIM_SCGC_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)
SIM SCGC bit index.

Enumerations

- enum [clock_wdog_src_k66f18_t](#) {
 [kClockWdogSrcLpoClk](#),
 [kClockWdogSrcAltClk](#) }
WDOG clock source select.
- enum [clock_trace_src_k66f18_t](#) {
 [kClockTraceSrcMcgoutClkDiv](#),
 [kClockTraceSrcCoreClk](#) }
Debug trace clock source select.
- enum [clock_port_filter_src_k66f18_t](#) {
 [kClockPortFilterSrcBusClk](#),
 [kClockPortFilterSrcLpoClk](#) }
PORTx digital input filter clock source select.
- enum [clock_tpm_src_k66f18_t](#) {
 [kClockTpmSrcNone](#),
 [kClockTpmSrcPlIFllSelDiv](#),
 [kClockTpmSrcOsc0erClk](#),
 [kClockTpmSrcMcgIrClk](#) }
TPM clock source select.
- enum [clock_lptmr_src_k66f18_t](#) {
 [kClockLptmrSrcMcgIrClk](#),
 [kClockLptmrSrcLpoClk](#),
 [kClockLptmrSrcEr32kClk](#),
 [kClockLptmrSrcOsc0erClkUndiv](#) }
LPTMR clock source select.
- enum [clock_lpuart_src_k66f18_t](#) {
 [kClockLpuartSrcNone](#),
 [kClockLpuartSrcPlIFllSel](#),
 [kClockLpuartSrcOsc0erClk](#),

SIM HAL driver

- `kClockLpuartSrcMcgIrClk` }

SIM LPUART clock source.
- enum `sim_lpuart_rxsrc_k66f18_t` {

              - Clock gate name used for SIM\_HAL\_EnableClock/SIM\_HAL\_DisableClock.*

## 66.2.31.2 Macro Definition Documentation

66.2.31.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.31.3 Enumeration Type Documentation

66.2.31.3.1 `enum clock_wdog_src_k66f18_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

## SIM HAL driver

### 66.2.31.3.2 enum clock\_trace\_src\_k66f18\_t

Enumerator

*kClockTraceSrcMcgoutClkDiv* MCG out clock divided by the fractional divider configured by SIM\_CLKDIV4[TRACEFRAC, TRACEDIV].  
*kClockTraceSrcCoreClk* core clock

### 66.2.31.3.3 enum clock\_port\_filter\_src\_k66f18\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.31.3.4 enum clock\_tpm\_src\_k66f18\_t

Enumerator

*kClockTpmSrcNone* clock disabled  
*kClockTpmSrcPllFllSelDiv* clock as selected by SOPT2[PLLFLSEL] and divided by the fractional divider configured by SIM\_CLKDIV3[PLLFLFRAC, PLLFLLDIV].  
*kClockTpmSrcOsc0erClk* OSCERCLK clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.31.3.5 enum clock\_lptmr\_src\_k66f18\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.

### 66.2.31.3.6 enum clock\_lpuart\_src\_k66f18\_t

Enumerator

*kClockLpuartSrcNone* Clock disabled.  
*kClockLpuartSrcPllFllSel* Clock as selected by SOPT2[PLLFLSEL].  
*kClockLpuartSrcOsc0erClk* OSCERCLK.  
*kClockLpuartSrcMcgIrClk* MCGIRCLK.

**66.2.31.3.7 enum sim\_lpuart\_rxsrc\_k66f18\_t**

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.  
*kSimLpuartRxsrcCmp1* CMP1.

**66.2.31.3.8 enum sim\_lpuart\_txsrc\_k66f18\_t**

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.  
*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

**66.2.31.3.9 enum clock\_time\_src\_k66f18\_t**

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.  
*kClockTimeSrcPlLFllSel* clock as selected by SOPT2[PLLFLLSEL].  
*kClockTimeSrcOsc0erClk* OSCERCLK clock.  
*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

**66.2.31.3.10 enum clock\_rmii\_src\_k66f18\_t**

Enumerator

*kClockRmiiSrcExtalClk* EXTAL Clock.  
*kClockRmiiSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

**66.2.31.3.11 enum clock\_usbfs\_src\_k66f18\_t**

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPlLFllSel* Clock divider USB FS clock.

**66.2.31.3.12 enum clock\_flexcan\_src\_k66f18\_t**

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.  
*kClockFlexcanSrcBusClk* Bus clock.

## SIM HAL driver

### 66.2.31.3.13 enum clock\_sdhc\_src\_k66f18\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.31.3.14 enum clock\_sai\_src\_k66f18\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllFllSel* MCGPLLFLCLK.

### 66.2.31.3.15 enum clock\_pllfl\_sel\_k66f18\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.  
*kClockPllFllSelUsb1pfd* USB1 PFD clock.  
*kClockPllFllSelIrc48M* IRC48MCLK.

### 66.2.31.3.16 enum clock\_er32k\_src\_k66f18\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.31.3.17 enum clock\_clkout\_src\_k66f18\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.31.3.18 enum clock\_rtcout\_src\_k66f18\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

### 66.2.31.3.19 enum clock\_usbhs\_slowclk\_src\_k66f18\_t

Enumerator

*kClockUsbhsSlowClkSrcMcgIrClk* MCGIRCLK clock.  
*kClockUsbhsSlowClkSrcRtc32kHz* RTC 32kHz clock.

### 66.2.31.3.20 enum sim\_usbsstby\_mode\_k66f18\_t

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.31.3.21 enum sim\_usbvstby\_mode\_k66f18\_t

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.31.3.22 enum sim\_usbvout\_mode\_k66f18\_t

Enumerator

*kSimUsbvout2\_733V* USB 3V regulator output voltage set to 2.733V.  
*kSimUsbvout3\_020V* USB 3V regulator output voltage set to 3.020V.  
*kSimUsbvout3\_074V* USB 3V regulator output voltage set to 3.074V.  
*kSimUsbvout3\_130V* USB 3V regulator output voltage set to 3.130V.  
*kSimUsbvout3\_188V* USB 3V regulator output voltage set to 3.188V.  
*kSimUsbvout3\_248V* USB 3V regulator output voltage set to 3.248V.  
*kSimUsbvout3\_310V* USB 3V regulator output voltage set to 3.310V.

## SIM HAL driver

### 66.2.31.3.23 enum sim\_adc\_pretrg\_sel\_k66f18\_t

Enumerator

- kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.
- kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.31.3.24 enum sim\_adc\_trg\_sel\_k66f18\_t

Enumerator

- kSimAdcTrgSelExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelHighSpeedComp2* High speed comparator 2 output.
- kSimAdcTrgSelPit0* PIT trigger 0.
- kSimAdcTrgSelPit1* PIT trigger 1.
- kSimAdcTrgSelPit2* PIT trigger 2.
- kSimAdcTrgSelPit3* PIT trigger 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.
- kSimAdcTrgSelFtm3* FTM3 trigger.
- kSimAdcTrgSelRtcAlarm* RTC alarm.
- kSimAdcTrgSelRtcSec* RTC seconds.
- kSimAdcTrgSelLptimer* Low-power timer trigger.
- kSimAdcTrgSelTpm* TPMx channel 0 (A pretrigger) and channel 1 (B pretrigger)

### 66.2.31.3.25 enum sim\_uart\_rxsrc\_k66f18\_t

Enumerator

- kSimUartRxsrcPin* UARTx\_RX Pin.
- kSimUartRxsrcCmp0* CMP0.
- kSimUartRxsrcCmp1* CMP1.

### 66.2.31.3.26 enum sim\_uart\_txsrc\_k66f18\_t

Enumerator

- kSimUartTxsrcPin* UARTx\_TX Pin.
- kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.
- kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

**66.2.31.3.27 enum sim\_ftm\_trg\_src\_k66f18\_t**

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.**66.2.31.3.28 enum sim\_ftm\_clk\_sel\_k66f18\_t**

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.*kSimFtmClkSel1* FTM CLKIN1 pin.**66.2.31.3.29 enum sim\_ftm\_ch\_src\_k66f18\_t**

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.**66.2.31.3.30 enum sim\_ftm\_ch\_out\_src\_k66f18\_t**

Enumerator

*kSimFtmChOutSrc0* FlexTimer x channel y output source selection 0.*kSimFtmChOutSrc1* FlexTimer x channel y output source selection 1.**66.2.31.3.31 enum sim\_ftmflt\_sel\_k66f18\_t**

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.*kSimFtmFltSel1* FlexTimer x fault y select 1.**66.2.31.3.32 enum sim\_tpm\_clk\_sel\_k66f18\_t**

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

## SIM HAL driver

### 66.2.31.3.33 enum sim\_tpm\_ch\_src\_k66f18\_t

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

### 66.2.31.3.34 enum sim\_cmtuartpad\_strength\_k66f18\_t

Enumerator

- kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.
- kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

### 66.2.31.3.35 enum sim\_ptd7pad\_strength\_k66f18\_t

Enumerator

- kSimPtd7padSinglePad* Single-pad drive strength for PTD7.
- kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### 66.2.31.3.36 enum sim\_flexbus\_security\_level\_k66f18\_t

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

### 66.2.31.3.37 enum sim\_clock\_gate\_name\_k66f18\_t

## 66.2.32 K80F25615 SIM HAL driver

### 66.2.32.1 Overview

The section describes the enumerations, macros and data structures for K80F25615 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK80F25615.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)

### 66.2.32.2 Macro Definition Documentation

66.2.32.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.32.3 Enumeration Type Documentation

66.2.32.3.1 enum `clock_wdog_src_k80f25615_t`

Enumerator

- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.
- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.
- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.

66.2.32.3.2 enum `clock_trace_src_k80f25615_t`

Enumerator

- `kClockTraceSrcMcgoutClkDiv` MCG out clock divided by the fractional divider configured by SIM\_CLKDIV4[TRACEFRAC, TRACEDIV].
- `kClockTraceSrcCoreClk` core clock

66.2.32.3.3 enum `clock_port_filter_src_k80f25615_t`

Enumerator

- `kClockPortFilterSrcBusClk` Bus clock.
- `kClockPortFilterSrcLpoClk` LPO.

## SIM HAL driver

### 66.2.32.3.4 enum clock\_tpm\_src\_k80f25615\_t

Enumerator

*kClockTpmSrcNone* clock disabled

*kClockTpmSrcPllFllSelDiv* clock as selected by SOPT2[PLLFLSEL] and divided by the fractional divider configured by SIM\_CLKDIV3[PLLFLFRAC, PLLFLLDIV].

*kClockTpmSrcOsc0erClk* OSCERCLK clock.

*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.32.3.5 enum clock\_lptmr\_src\_k80f25615\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.32.3.6 enum clock\_lpuart\_src\_k80f25615\_t

Enumerator

*kClockLpuartSrcNone* Clock disabled.

*kClockLpuartSrcPllFllSel* Clock as selected by SOPT2[PLLFLSEL].

*kClockLpuartSrcOsc0erClk* OSCERCLK.

*kClockLpuartSrcMcgIrClk* MCGIRCLK.

### 66.2.32.3.7 enum sim\_lpuart\_rxsrc\_k80f25615\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.

*kSimLpuartRxsrcCmp0* CMP0.

*kSimLpuartRxsrcCmp1* CMP1.

### 66.2.32.3.8 enum sim\_lpuart\_txsrc\_k80f25615\_t

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.

*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.

*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

**66.2.32.3.9 enum clock\_flexio\_src\_k80f25615\_t**

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcPllFllSelDiv* Clock as selected by SOPT2[PLLFLSEL].  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

**66.2.32.3.10 enum clock\_usbfs\_src\_k80f25615\_t**

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

**66.2.32.3.11 enum clock\_emvsim\_src\_k80f25615\_t**

Enumerator

*kClockEmvsimSrcNone* Clock disabled.  
*kClockEmvsimSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockEmvsimSrcOsc0erClk* OSCERCLK clock.  
*kClockEmvsimSrcMcgIrClk* MCGIR clock.

**66.2.32.3.12 enum clock\_sdhc\_src\_k80f25615\_t**

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

**66.2.32.3.13 enum clock\_sai\_src\_k80f25615\_t**

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllFllSel* MCGPLLFLCLK.

## SIM HAL driver

### 66.2.32.3.14 enum clock\_qspi\_src\_k80f25615\_t

Enumerator

*kClockQspiSrcSysClk* SYSCLK.  
*kClockQspiSrcFllClk* MCGFLLCLK.  
*kClockQspiSrcPllClk* MCGPLLCLK.  
*kClockQspiSrcPll2xClk* MCGPLL2XCLK.  
*kClockQspiSrcIrc48M* IRC48MCLK.  
*kClockQspiSrcOsc0erClk* OSCERCLK clock.  
*kClockQspiSrcMcgIrClk* MCGIR clock.

### 66.2.32.3.15 enum clock\_pllfl\_sel\_k80f25615\_t

Enumerator

*kClockPlIFllSelFll* Fll clock.  
*kClockPlIFllSelPll* Pll0 clock.  
*kClockPlIFllSelIrc48M* IRC48MCLK.

### 66.2.32.3.16 enum clock\_er32k\_src\_k80f25615\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.32.3.17 enum clock\_clkout\_src\_k80f25615\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

**66.2.32.3.18 enum clock\_rtcout\_src\_k80f25615\_t**

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

**66.2.32.3.19 enum sim\_usbsstby\_mode\_k80f25615\_t**

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

**66.2.32.3.20 enum sim\_usbvstby\_mode\_k80f25615\_t**

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

**66.2.32.3.21 enum sim\_adc\_pretrg\_sel\_k80f25615\_t**

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

**66.2.32.3.22 enum sim\_adc\_trg\_sel\_k80f25615\_t**

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelFtm3* FTM3 trigger.

## SIM HAL driver

*kSimAdcTrgSelRtcAlarm* RTC alarm.

*kSimAdcTrgSelRtcSec* RTC seconds.

*kSimAdcTrgSelLptimer* Low-power timer trigger.

*kSimAdcTrgSelTpm* TPMx channel 0 (A pretrigger) and channel 1 (B pretrigger)

### 66.2.32.3.23 enum sim\_ftm\_trg\_src\_k80f25615\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.

*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.32.3.24 enum sim\_ftm\_clk\_sel\_k80f25615\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.

*kSimFtmClkSel1* FTM CLKIN1 pin.

### 66.2.32.3.25 enum sim\_ftm\_ch\_src\_k80f25615\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.

*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.

*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.

*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.32.3.26 enum sim\_ftm\_ch\_out\_src\_k80f25615\_t

Enumerator

*kSimFtmChOutSrc0* FlexTimer x channel y output source selection 0.

*kSimFtmChOutSrc1* FlexTimer x channel y output source selection 1.

### 66.2.32.3.27 enum sim\_ftmflt\_sel\_k80f25615\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.

*kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.32.3.28 enum sim\_tpm\_clk\_sel\_k80f25615\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.32.3.29 enum sim\_tpm\_ch\_src\_k80f25615\_t**

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

**66.2.32.3.30 enum sim\_flexbus\_security\_level\_k80f25615\_t**

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

**66.2.32.3.31 enum sim\_clock\_gate\_name\_k80f25615\_t**

## SIM HAL driver

### 66.2.33 K81F25615 SIM HAL driver

#### 66.2.33.1 Overview

The section describes the enumerations, macros and data structures for K81F25615 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK81F25615.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_k80f25615\\_t](#) {  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#),  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#),  
[kClockWdogSrcLpoClk](#),  
[kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_k81f25615\\_t](#) {  
[kClockTraceSrcMcgoutClkDiv](#),

### 66.2.33.2 Macro Definition Documentation

66.2.33.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.33.3 Enumeration Type Documentation

66.2.33.3.1 enum `clock_wdog_src_k80f25615_t`

Enumerator

- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.
- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.
- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.

66.2.33.3.2 enum `clock_trace_src_k81f25615_t`

Enumerator

- `kClockTraceSrcMcgoutClkDiv` MCG out clock divided by the fractional divider configured by SIM\_CLKDIV4[TRACEFRAC, TRACEDIV].
- `kClockTraceSrcCoreClk` core clock

66.2.33.3.3 enum `clock_port_filter_src_k81f25615_t`

Enumerator

- `kClockPortFilterSrcBusClk` Bus clock.
- `kClockPortFilterSrcLpoClk` LPO.

**66.2.33.3.4 enum clock\_tpm\_src\_k81f25615\_t**

Enumerator

*kClockTpmSrcNone* clock disabled*kClockTpmSrcPllFllSelDiv* clock as selected by SOPT2[PLLFLSEL] and divided by the fractional divider configured by SIM\_CLKDIV3[PLLFLFRAC, PLLFLLDIV].*kClockTpmSrcOsc0erClk* OSCERCLK clock.*kClockTpmSrcMcgIrClk* MCGIR clock.**66.2.33.3.5 enum clock\_lptmr\_src\_k81f25615\_t**

Enumerator

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

## SIM HAL driver

### 66.2.33.3.9 enum clock\_flexio\_src\_k81f25615\_t

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcPllFllSelDiv* Clock as selected by SOPT2[PLLFLSEL].  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

### 66.2.33.3.10 enum clock\_usbfs\_src\_k81f25615\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

### 66.2.33.3.11 enum clock\_emvsim\_src\_k81f25615\_t

Enumerator

*kClockEmvsimSrcNone* Clock disabled.  
*kClockEmvsimSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockEmvsimSrcOsc0erClk* OSCERCLK clock.  
*kClockEmvsimSrcMcgIrClk* MCGIR clock.

### 66.2.33.3.12 enum clock\_sdhc\_src\_k81f25615\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.33.3.13 enum clock\_sai\_src\_k81f25615\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllFllSel* MCGPLLFLCLK.

**66.2.33.3.14 enum clock\_qspi\_src\_k81f25615\_t**

Enumerator

*kClockQspiSrcSysClk* SYSCLK.  
*kClockQspiSrcFllClk* MCGFLLCLK.  
*kClockQspiSrcPllClk* MCGPLLCLK.  
*kClockQspiSrcPll2xClk* MCGPLL2XCLK.  
*kClockQspiSrcIrc48M* IRC48MCLK.  
*kClockQspiSrcOsc0erClk* OSCERCLK clock.  
*kClockQspiSrcMcgIrClk* MCGIR clock.

**66.2.33.3.15 enum clock\_pllfl\_sel\_k81f25615\_t**

Enumerator

*kClockPllFlSelFll* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.  
*kClockPllFlSelIrc48M* IRC48MCLK.

**66.2.33.3.16 enum clock\_er32k\_src\_k81f25615\_t**

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

**66.2.33.3.17 enum clock\_clkout\_src\_k81f25615\_t**

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

## SIM HAL driver

### 66.2.33.3.18 enum clock\_rtcout\_src\_k81f25615\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

### 66.2.33.3.19 enum sim\_usbsstby\_mode\_k81f25615\_t

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.33.3.20 enum sim\_usbvstby\_mode\_k81f25615\_t

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.33.3.21 enum sim\_adc\_pretrg\_sel\_k81f25615\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.33.3.22 enum sim\_adc\_trg\_sel\_k81f25615\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelFtm3* FTM3 trigger.

*kSimAdcTrgSelRtcAlarm* RTC alarm.

*kSimAdcTrgSelRtcSec* RTC seconds.

*kSimAdcTrgSelLptimer* Low-power timer trigger.

*kSimAdcTrgSelTpm* TPMx channel 0 (A pretrigger) and channel 1 (B pretrigger)

#### 66.2.33.3.23 enum sim\_ftm\_trg\_src\_k81f25615\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.

*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

#### 66.2.33.3.24 enum sim\_ftm\_clk\_sel\_k81f25615\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.

*kSimFtmClkSel1* FTM CLKIN1 pin.

#### 66.2.33.3.25 enum sim\_ftm\_ch\_src\_k81f25615\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.

*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.

*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.

*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

#### 66.2.33.3.26 enum sim\_ftm\_ch\_out\_src\_k81f25615\_t

Enumerator

*kSimFtmChOutSrc0* FlexTimer x channel y output source selection 0.

*kSimFtmChOutSrc1* FlexTimer x channel y output source selection 1.

#### 66.2.33.3.27 enum sim\_ftmflt\_sel\_k81f25615\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.

*kSimFtmFltSel1* FlexTimer x fault y select 1.

## SIM HAL driver

### 66.2.33.3.28 enum sim\_tpm\_clk\_sel\_k81f25615\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.33.3.29 enum sim\_tpm\_ch\_src\_k81f25615\_t

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

### 66.2.33.3.30 enum sim\_flexbus\_security\_level\_k81f25615\_t

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

### 66.2.33.3.31 enum sim\_clock\_gate\_name\_k81f25615\_t

## 66.2.34 K82F25615 SIM HAL driver

### 66.2.34.1 Overview

The section describes the enumerations, macros and data structures for K82F25615 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MK82F25615.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

### 66.2.34.2 Macro Definition Documentation

66.2.34.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.34.3 Enumeration Type Documentation

66.2.34.3.1 enum `clock_wdog_src_k80f25615_t`

Enumerator

- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.
- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.
- `kClockWdogSrcLpoClk` LPO.
- `kClockWdogSrcAltClk` Alternative clock, for this SOC it is Bus clock.

66.2.34.3.2 enum `clock_trace_src_k82f25615_t`

Enumerator

- `kClockTraceSrcMcgoutClkDiv` MCG out clock divided by the fractional divider configured by SIM\_CLKDIV4[TRACEFRAC, TRACEDIV].
- `kClockTraceSrcCoreClk` core clock

66.2.34.3.3 enum `clock_port_filter_src_k82f25615_t`

Enumerator

- `kClockPortFilterSrcBusClk` Bus clock.
- `kClockPortFilterSrcLpoClk` LPO.

## SIM HAL driver

### 66.2.34.3.4 enum clock\_tpm\_src\_k82f25615\_t

Enumerator

*kClockTpmSrcNone* clock disabled

*kClockTpmSrcPllFllSelDiv* clock as selected by SOPT2[PLLFLSEL] and divided by the fractional divider configured by SIM\_CLKDIV3[PLLFLFRAC, PLLFLLDIV].

*kClockTpmSrcOsc0erClk* OSCERCLK clock.

*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.34.3.5 enum clock\_lptmr\_src\_k82f25615\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.34.3.6 enum clock\_lpuart\_src\_k82f25615\_t

Enumerator

*kClockLpuartSrcNone* Clock disabled.

*kClockLpuartSrcPllFllSel* Clock as selected by SOPT2[PLLFLSEL].

*kClockLpuartSrcOsc0erClk* OSCERCLK.

*kClockLpuartSrcMcgIrClk* MCGIRCLK.

### 66.2.34.3.7 enum sim\_lpuart\_rxsrc\_k82f25615\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.

*kSimLpuartRxsrcCmp0* CMP0.

*kSimLpuartRxsrcCmp1* CMP1.

### 66.2.34.3.8 enum sim\_lpuart\_txsrc\_k82f25615\_t

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.

*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.

*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

### 66.2.34.3.9 enum clock\_flexio\_src\_k82f25615\_t

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcPllFllSelDiv* Clock as selected by SOPT2[PLLFLLESEL].  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

### 66.2.34.3.10 enum clock\_usbfs\_src\_k82f25615\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

### 66.2.34.3.11 enum clock\_emvsim\_src\_k82f25615\_t

Enumerator

*kClockEmvsimSrcNone* Clock disabled.  
*kClockEmvsimSrcPllFllSel* clock as selected by SOPT2[PLLFLLESEL].  
*kClockEmvsimSrcOsc0erClk* OSCERCLK clock.  
*kClockEmvsimSrcMcgIrClk* MCGIR clock.

### 66.2.34.3.12 enum clock\_sdhc\_src\_k82f25615\_t

Enumerator

*kClockSdhcSrcCoreSysClk* Core/system clock.  
*kClockSdhcSrcPllFllSel* clock as selected by SOPT2[PLLFLLESEL].  
*kClockSdhcSrcOsc0erClk* OSCERCLK clock.  
*kClockSdhcSrcExt* External bypass clock (SDHC0\_CLKIN)

### 66.2.34.3.13 enum clock\_sai\_src\_k82f25615\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllFllSel* MCGPLLFLLESEL.

## SIM HAL driver

### 66.2.34.3.14 enum clock\_qspi\_src\_k82f25615\_t

Enumerator

*kClockQspiSrcSysClk* SYSCLK.  
*kClockQspiSrcFllClk* MCGFLLCLK.  
*kClockQspiSrcPllClk* MCGPLLCLK.  
*kClockQspiSrcPll2xClk* MCGPLL2XCLK.  
*kClockQspiSrcIrc48M* IRC48MCLK.  
*kClockQspiSrcOsc0erClk* OSCERCLK clock.  
*kClockQspiSrcMcgIrClk* MCGIR clock.

### 66.2.34.3.15 enum clock\_pllfl\_sel\_k82f25615\_t

Enumerator

*kClockPlIFllSelFll* Fll clock.  
*kClockPlIFllSelPll* Pll0 clock.  
*kClockPlIFllSelIrc48M* IRC48MCLK.

### 66.2.34.3.16 enum clock\_er32k\_src\_k82f25615\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.34.3.17 enum clock\_clkout\_src\_k82f25615\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelRtc* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.34.3.18 enum clock\_rtcout\_src\_k82f25615\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

### 66.2.34.3.19 enum sim\_usbsstby\_mode\_k82f25615\_t

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

### 66.2.34.3.20 enum sim\_usbvstby\_mode\_k82f25615\_t

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

### 66.2.34.3.21 enum sim\_adc\_pretrg\_sel\_k82f25615\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.34.3.22 enum sim\_adc\_trg\_sel\_k82f25615\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelFtm3* FTM3 trigger.

## SIM HAL driver

*kSimAdcTrgSelRtcAlarm* RTC alarm.

*kSimAdcTrgSelRtcSec* RTC seconds.

*kSimAdcTrgSelLptimer* Low-power timer trigger.

*kSimAdcTrgSelTpm* TPMx channel 0 (A pretrigger) and channel 1 (B pretrigger)

### 66.2.34.3.23 enum sim\_ftm\_trg\_src\_k82f25615\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.

*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.34.3.24 enum sim\_ftm\_clk\_sel\_k82f25615\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.

*kSimFtmClkSel1* FTM CLKIN1 pin.

### 66.2.34.3.25 enum sim\_ftm\_ch\_src\_k82f25615\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.

*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.

*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.

*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.34.3.26 enum sim\_ftm\_ch\_out\_src\_k82f25615\_t

Enumerator

*kSimFtmChOutSrc0* FlexTimer x channel y output source selection 0.

*kSimFtmChOutSrc1* FlexTimer x channel y output source selection 1.

### 66.2.34.3.27 enum sim\_ftmflt\_sel\_k82f25615\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.

*kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.34.3.28 enum sim\_tpm\_clk\_sel\_k82f25615\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.34.3.29 enum sim\_tpm\_ch\_src\_k82f25615\_t**

Enumerator

- kSimTpmChSrc0* TPM x channel y input capture source 0.
- kSimTpmChSrc1* TPM x channel y input capture source 1.
- kSimTpmChSrc2* TPM x channel y input capture source 2.
- kSimTpmChSrc3* TPM x channel y input capture source 3.

**66.2.34.3.30 enum sim\_flexbus\_security\_level\_k82f25615\_t**

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

**66.2.34.3.31 enum sim\_clock\_gate\_name\_k82f25615\_t**

## SIM HAL driver

### 66.2.35 KL02Z4 SIM HAL driver

#### 66.2.35.1 Overview

The section describes the enumerations, macros and data structures for KL02Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKL02Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kl02z4\\_t](#) {  
  [kClockCopSrcLpoClk](#),  
  [kClockCopSrcAltClk](#) }  
*COP clock source select.*
- enum [clock\\_tpm\\_src\\_kl02z4\\_t](#) {  
  [kClockTpmSrcNone](#),  
  [kClockTpmSrcFll](#),  
  [kClockTpmSrcOsc0erClk](#),  
  [kClockTpmSrcMcgIrClk](#) }  
*TPM clock source select.*
- enum [clock\\_lptmr\\_src\\_kl02z4\\_t](#) {  
  [kClockLptmrSrcMcgIrClk](#),  
  [kClockLptmrSrcLpoClk](#),  
  [kClockLptmrSrcEr32kClk](#),  
  [kClockLptmrSrcOsc0erClk](#) }  
*LPTMR clock source select.*
- enum [clock\\_lpsci\\_src\\_kl02z4\\_t](#) {  
  [kClockLpsciSrcNone](#),  
  [kClockLpsciSrcFll](#),  
  [kClockLpsciSrcOsc0erClk](#),  
  [kClockLpsciSrcMcgIrClk](#) }  
*UART0 clock source select.*
- enum [clock\\_clkout\\_src\\_kl02z4\\_t](#) {

```

kClockClkoutReserved = 0U,
kClockClkoutReserved1 = 1U,

`kSimLpsciTxsrcPin`,  
`kSimLpsciTxsrcTpm1` }

*SIM LPSCI transmit data source select.*

- enum `sim_tpm_clk_sel_kl02z4_t` {  
`kSimTpmClkSel0`,  
`kSimTpmClkSel1` }

*SIM Timer/PWM external clock select.*

- enum `sim_tpm_ch_src_kl02z4_t` {  
`kSimTpmChSrc0`,  
`kSimTpmChSrc1` }

## SIM HAL driver

*SIM Timer/PWM x channel y input capture source select.*

- enum `sim_clock_gate_name_kl02z4_t`

*Clock gate name used for SIM\_HAL\_EnableClock/SIM\_HAL\_DisableClock.*

### 66.2.35.2 Macro Definition Documentation

66.2.35.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.35.3 Enumeration Type Documentation

66.2.35.3.1 enum `clock_cop_src_kl02z4_t`

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KL02Z4 it is Bus clock.

66.2.35.3.2 enum `clock_tpm_src_kl02z4_t`

Enumerator

*kClockTpmSrcNone* clock disabled

*kClockTpmSrcFll* MCGFLLCLK.

*kClockTpmSrcOsc0erClk* OSCERCLK clock.

*kClockTpmSrcMcgIrClk* MCGIR clock.

66.2.35.3.3 enum `clock_lptmr_src_kl02z4_t`

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

66.2.35.3.4 enum `clock_lpsci_src_kl02z4_t`

Enumerator

*kClockLpsciSrcNone* clock disabled

*kClockLpsciSrcFll* MCGFLLCLK.

*kClockLpsciSrcOsc0erClk* OSCERCLK clock.

*kClockLpsciSrcMcgIrClk* MCGIR clock.

### 66.2.35.3.5 enum clock\_clkout\_src\_kl02z4\_t

Enumerator

*kClockClkoutReserved* Reserved.  
*kClockClkoutReserved1* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutReserved2* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

### 66.2.35.3.6 enum sim\_adc\_pretrg\_sel\_kl02z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.35.3.7 enum sim\_adc\_trg\_sel\_kl02z4\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelReserved5* Reserved.  
*kSimAdcTrgSelReserved6* Reserved.  
*kSimAdcTrgSelReserved7* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelReserved10* Reserved.  
*kSimAdcTrgSelReserved11* Reserved.  
*kSimAdcTrgSelReserved12* Reserved.  
*kSimAdcTrgSelReserved13* Reserved.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelReserved15* Reserved.

## SIM HAL driver

### 66.2.35.3.8 enum sim\_lpsci\_rxsrc\_kl02z4\_t

Enumerator

*kSimLpsciRxsrcPin* LPSCIx\_RX Pin.

*kSimLpsciRxsrcCmp0* CMP0.

### 66.2.35.3.9 enum sim\_lpsci\_txsrc\_kl02z4\_t

Enumerator

*kSimLpsciTxsrcPin* LPSCIx\_TX Pin.

*kSimLpsciTxsrcTpm1* LPSCIx\_TX pin modulated with TPM1 channel 0 output.

### 66.2.35.3.10 enum sim\_tpm\_clk\_sel\_kl02z4\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.35.3.11 enum sim\_tpm\_ch\_src\_kl02z4\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.

*kSimTpmChSrc1* CMP0 output.

### 66.2.35.3.12 enum sim\_clock\_gate\_name\_kl02z4\_t

## 66.2.36 KL03Z4 SIM HAL driver

### 66.2.36.1 Overview

The section describes the enumerations, macros and data structures for KL03Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKL03Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)

## 66.2.36.2 Macro Definition Documentation

66.2.36.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.36.3 Enumeration Type Documentation

### 66.2.36.3.1 enum `clock_cop_src_kl03z4_t`

Enumerator

*kClockCopSrcLpoClk* LPO clock,1K HZ.  
*kClockCopSrcMcgIrClk* MCG IRC Clock.  
*kClockCopSrcOsc0erClk* OSCER Clock.  
*kClockCopSrcBusClk* BUS clock.

### 66.2.36.3.2 enum `clock_er32k_src_kl03z4_t`

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.36.3.3 enum `clock_osc32kout_sel_kl03z4_t`

Enumerator

*kClockOsc32koutNone* ERCLK32K is not output.  
*kClockOsc32koutPtB13* ERCLK32K output on PTB13.

### 66.2.36.3.4 enum `clock_lpuart_src_kl03z4_t`

Enumerator

*kClockLpuartSrcNone* disabled  
*kClockLpuartSrcIrc48M* IRC48M.  
*kClockLpuartSrcOsc0erClk* OSCER clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

## SIM HAL driver

### 66.2.36.3.5 enum clock\_tpm\_src\_kl03z4\_t

Enumerator

*kClockTpmSrcNone* disabled  
*kClockTpmSrcIrc48M* IRC48M.  
*kClockTpmSrcOsc0erClk* OSCER clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.36.3.6 enum clock\_lptmr\_src\_kl03z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.36.3.7 enum clock\_clkout\_src\_kl03z4\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelOsc0erClk* OSCER clock.  
*kClockClkoutSelIrc48M* IRC48M clock.

### 66.2.36.3.8 enum clock\_rtcout\_src\_kl03z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrcOsc0erClk* OSCER clock.

### 66.2.36.3.9 enum sim\_adc\_pretrg\_sel\_kl03z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

**66.2.36.3.10 enum sim\_adc\_trg\_sel\_kl03z4\_t**

Enumerator

- kSimAdcTrgselExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelTpm0* TPM0 trigger.
- kSimAdcTrgSelTpm1* TPM1 trigger.
- kSimAdcTrgSelRtcAlarm* RTC alarm.
- kSimAdcTrgSelRtcSec* RTC seconds.
- kSimAdcTrgSelLptimer* Low-power timer trigger.

**66.2.36.3.11 enum sim\_lpuart\_rxsrc\_kl03z4\_t**

Enumerator

- kSimLpuartRxsrcPin* LPUARTx\_RX Pin.
- kSimLpuartRxsrcCmp0* CMP0.

**66.2.36.3.12 enum sim\_lpuart\_txsrc\_kl03z4\_t**

Enumerator

- kSimLpuartTxsrcPin* LPUARTx\_TX Pin.
- kSimLpuartTxsrcFtm1* LPUARTx\_TX pin modulated with FTM1 channel 0 output.

**66.2.36.3.13 enum sim\_tpm\_clk\_sel\_kl03z4\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.36.3.14 enum sim\_tpm\_ch\_src\_kl03z4\_t**

Enumerator

- kSimTpmChSrc0* TPMx\_CH0 signal.
- kSimTpmChSrc1* CMP0 output.

## SIM HAL driver

### 66.2.36.3.15 enum sim\_ptd7pad\_strength\_kl03z4\_t

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.

*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### 66.2.36.3.16 enum sim\_clock\_gate\_name\_kl03z4\_t

## 66.2.37 KL13Z6 SIM HAL driver

### 66.2.37.1 Overview

The section describes the enumerations, macros and data structures for KL13Z6 SIM HAL driver.

## 66.2.37.2 Macro Definition Documentation

66.2.37.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.37.3 Enumeration Type Documentation

66.2.37.3.1 enum `clock_cop_src_kl13z644_t`

Enumerator

*kClockCopSrcLpoClk* LPO clock 1K HZ.  
*kClockCopSrcMcgIrClk* MCG IRC Clock.  
*kClockCopSrcOsc0erClk* OSCER Clock.  
*kClockCopSrcBusClk* BUS clock.

66.2.37.3.2 enum `clock_er32k_src_kl13z644_t`

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

66.2.37.3.3 enum `clock_osc32kout_sel_kl13z644_t`

Enumerator

*kClockOsc32koutNone* ERCLK32K is not output.  
*kClockOsc32koutPte0* ERCLK32K output on PTE0.

## SIM HAL driver

### 66.2.37.3.4 enum clock\_lpuart\_src\_kl13z644\_t

Enumerator

*kClockLpuartSrcNone* disabled  
*kClockLpuartSrcIrc48M* IRC48M.  
*kClockLpuartSrcOsc0erClk* OSCER clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

### 66.2.37.3.5 enum clock\_tpm\_src\_kl13z644\_t

Enumerator

*kClockTpmSrcNone* disabled  
*kClockTpmSrcIrc48M* IRC48M/MCGPCLK.  
*kClockTpmSrcOsc0erClk* OSCER clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.37.3.6 enum clock\_flexio\_src\_kl13z644\_t

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcIrc48M* MCGPCLK/IRC48M.  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

### 66.2.37.3.7 enum clock\_lptmr\_src\_kl13z644\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.37.3.8 enum clock\_clkout\_src\_kl13z644\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelOsc0erClk* OSCER clock.  
*kClockClkoutSelIrc48M* IRC48M clock.

### 66.2.37.3.9 enum clock\_rtcout\_src\_kl13z644\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrcOsc0erClk* OSCER clock.

### 66.2.37.3.10 enum sim\_adc\_pretrg\_sel\_kl13z644\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.37.3.11 enum sim\_adc\_trg\_sel\_kl13z644\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.37.3.12 enum sim\_lpuart\_rxsrc\_kl13z644\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

### 66.2.37.3.13 enum sim\_lpuart\_txsrc\_kl13z644\_t

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.  
*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

## SIM HAL driver

### 66.2.37.3.14 enum sim\_tpm\_clk\_sel\_kl13z644\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.37.3.15 enum sim\_tpm\_ch\_src\_kl13z644\_t

Enumerator

*kSimTpmChSrc0* Channel y input capture source uses 0.

*kSimTpmChSrc1* Channel y input capture source uses 1.

*kSimTpmChSrc2* Channel y input capture source uses 2.

*kSimTpmChSrc3* Channel y input capture source uses 3.

## 66.2.38.2 Macro Definition Documentation

66.2.38.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.38.3 Enumeration Type Documentation

66.2.38.3.1 `enum clock_cop_src_kl16z4_t`

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KL16Z4 it is Bus clock.

## SIM HAL driver

### 66.2.38.3.2 enum clock\_tpm\_src\_kl16z4\_t

Enumerator

*kClockTpmSrcNone* clock disabled  
*kClockTpmSrcPlLFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockTpmSrcOsc0erClk* OSCERCLK clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.38.3.3 enum clock\_lptmr\_src\_kl16z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.38.3.4 enum clock\_lpsci\_src\_kl16z4\_t

Enumerator

*kClockLpsciSrcNone* clock disabled  
*kClockLpsciSrcPlLFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockLpsciSrcOsc0erClk* OSCERCLK clock.  
*kClockLpsciSrcMcgIrClk* MCGIR clock.

### 66.2.38.3.5 enum clock\_sai\_src\_kl16z4\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.38.3.6 enum clock\_pllfl\_sel\_kl16z4\_t

Enumerator

*kClockPlLFllSelFll* Fll clock.  
*kClockPlLFllSelPll* Pll0 clock.

**66.2.38.3.7 enum clock\_er32k\_src\_kl16z4\_t**

Enumerator

*kClockEr32kSrcOsc0* OSC 32k clock.  
*kClockEr32kSrcReserved* Reserved.  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

**66.2.38.3.8 enum clock\_clkout\_src\_kl16z4\_t**

Enumerator

*kClockClkoutReserved* Reserved.  
*kClockClkoutReserved1* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutReserved2* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

**66.2.38.3.9 enum clock\_rtcout\_src\_kl16z4\_t**

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32KHz clock

**66.2.38.3.10 enum sim\_adc\_pretrg\_sel\_kl16z4\_t**

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

**66.2.38.3.11 enum sim\_adc\_trg\_sel\_kl16z4\_t**

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved* Reserved.

## SIM HAL driver

*kSimAdcTrgSelReserved1* Reserved.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelReserved5* Reserved.

### 66.2.38.3.12 enum sim\_uart\_rxsrc\_kl16z4\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.

### 66.2.38.3.13 enum sim\_uart\_txsrc\_kl16z4\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimUartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.  
*kSimUartTxsrcReserved* Reserved.

### 66.2.38.3.14 enum sim\_lpsci\_rxsrc\_kl16z4\_t

Enumerator

*kSimLpsciRxsrcPin* LPSCIx\_RX Pin.  
*kSimLpsciRxsrcCmp0* CMP0.

### 66.2.38.3.15 enum sim\_lpsci\_txsrc\_kl16z4\_t

Enumerator

*kSimLpsciTxsrcPin* LPSCIx\_TX Pin.

*kSimLpsciTxsrcTpm1* LPSCIx\_TX pin modulated with TPM1 channel 0 output.  
*kSimLpsciTxsrcTpm2* LPSCIx\_TX pin modulated with TPM2 channel 0 output.  
*kSimLpsciTxsrcReserved* Reserved.

#### 66.2.38.3.16 enum sim\_tpm\_clk\_sel\_kl16z4\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.  
*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

#### 66.2.38.3.17 enum sim\_tpm\_ch\_src\_kl16z4\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.  
*kSimTpmChSrc1* CMP0 output.  
*kSimTpmChSrc2* Reserved.  
*kSimTpmChSrc3* USB start of frame pulse.

#### 66.2.38.3.18 enum sim\_clock\_gate\_name\_kl16z4\_t

## SIM HAL driver

### 66.2.39 KL17Z4 SIM HAL driver

#### 66.2.39.1 Overview

The section describes the enumerations, macros and data structures for KL17Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKL17Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kl17z4\\_t](#) {  
[kClockCopSrcLpoClk](#),

### 66.2.39.2 Macro Definition Documentation

66.2.39.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.39.3 Enumeration Type Documentation

#### 66.2.39.3.1 enum `clock_cop_src_kl17z4_t`

Enumerator

`kClockCopSrcLpoClk` LPO clock 1K HZ.  
`kClockCopSrcMcgIrClk` MCG IRC Clock.  
`kClockCopSrcOsc0erClk` OSCER Clock.  
`kClockCopSrcBusClk` BUS clock.

#### 66.2.39.3.2 enum `clock_er32k_src_kl17z4_t`

Enumerator

`kClockEr32kSrcOsc0` OSC0 clock (OSC032KCLK).  
`kClockEr32kSrcRtc` RTC 32k clock .  
`kClockEr32kSrcLpo` LPO clock.

**66.2.39.3.3 enum clock\_osc32kout\_sel\_kl17z4\_t**

Enumerator

*kClockOsc32koutNone* ERCLK32K is not output.  
*kClockOsc32koutPte0* ERCLK32K is output on PTE0.  
*kClockOsc32koutPte26* ERCLK32K is output on PTE26.

**66.2.39.3.4 enum clock\_lpuart\_src\_kl17z4\_t**

Enumerator

*kClockLpuartSrcNone* disabled  
*kClockLpuartSrcIrc48M* IRC48M.  
*kClockLpuartSrcOsc0erClk* OSCER clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

**66.2.39.3.5 enum clock\_tpm\_src\_kl17z4\_t**

Enumerator

*kClockTpmSrcNone* disabled  
*kClockTpmSrcIrc48M* IRC48M/MCGPCLK.  
*kClockTpmSrcOsc0erClk* OSCER clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

**66.2.39.3.6 enum clock\_flexio\_src\_kl17z4\_t**

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcIrc48M* MCGPCLK/IRC48M.  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

**66.2.39.3.7 enum clock\_lptmr\_src\_kl17z4\_t**

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

## SIM HAL driver

### 66.2.39.3.8 enum clock\_clkout\_src\_kl17z4\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelOsc0erClk* OSCER clock.  
*kClockClkoutSelIrc48M* IRC48M clock.

### 66.2.39.3.9 enum clock\_rtcout\_src\_kl17z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrcOsc0erClk* OSCER clock.

### 66.2.39.3.10 enum sim\_adc\_pretrg\_sel\_kl17z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.39.3.11 enum sim\_adc\_trg\_sel\_kl17z4\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.39.3.12 enum sim\_lpuart\_rxsrc\_kl17z4\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

**66.2.39.3.13 enum sim\_lpuart\_txsrc\_kl17z4\_t**

Enumerator

- kSimLpuartTxsrcPin* UARTx\_TX Pin.
- kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.
- kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

**66.2.39.3.14 enum clock\_sai\_src\_kl17z4\_t**

Enumerator

- kClockSaiSrcSysClk* SYSCLK.
- kClockSaiSrcOsc0erClk* OSC0ERCLK.
- kClockSaiSrcMcgIrClk* MCGIRCLK.
- kClockSaiSrcIrc48M* MCGPCLK/IRC48M.

**66.2.39.3.15 enum sim\_tpm\_clk\_sel\_kl17z4\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.39.3.16 enum sim\_tpm\_ch\_src\_kl17z4\_t**

Enumerator

- kSimTpmChSrc0* Channel y input capture source uses 0.
- kSimTpmChSrc1* Channel y input capture source uses 1.
- kSimTpmChSrc2* Channel y input capture source uses 2.
- kSimTpmChSrc3* Channel y input capture source uses 3.

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.40.3.12 enum sim\_adc\_trg\_sel\_kl17z644\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.

*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

#### 66.2.40.3.13 enum sim\_lpuart\_rxsrc\_kl17z644\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

#### 66.2.40.3.14 enum sim\_lpuart\_txsrc\_kl17z644\_t

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.  
*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

#### 66.2.40.3.15 enum sim\_tpm\_clk\_sel\_kl17z644\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.  
*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

#### 66.2.40.3.16 enum sim\_tpm\_ch\_src\_kl17z644\_t

Enumerator

*kSimTpmChSrc0* Channel y input capture source uses 0.  
*kSimTpmChSrc1* Channel y input capture source uses 1.  
*kSimTpmChSrc2* Channel y input capture source uses 2.  
*kSimTpmChSrc3* Channel y input capture source uses 3.

#### 66.2.40.3.17 enum sim\_clock\_gate\_name\_kl17z644\_t

## SIM HAL driver

### 66.2.41 KL26Z4 SIM HAL driver

#### 66.2.41.1 Overview

The section describes the enumerations, macros and data structures for KL26Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKL26Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kl26z4\\_t](#) {  
  [kClockCopSrcLpoClk](#),  
  [kClockCopSrcAltClk](#) }  
*COP clock source select.*

### 66.2.41.2 Macro Definition Documentation

66.2.41.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.41.3 Enumeration Type Documentation

66.2.41.3.1 `enum clock_cop_src_kl26z4_t`

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KL26Z4 it is Bus clock.

### 66.2.41.3.2 enum clock\_tpm\_src\_kl26z4\_t

Enumerator

*kClockTpmSrcNone* clock disabled  
*kClockTpmSrcPllFllSel* clock as selected by SOPT2[PLLFLLESEL].  
*kClockTpmSrcOsc0erClk* OSCERCLK clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.41.3.3 enum clock\_lptmr\_src\_kl26z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.41.3.4 enum clock\_lpsci\_src\_kl26z4\_t

Enumerator

*kClockLpsciSrcNone* clock disabled  
*kClockLpsciSrcPllFllSel* clock as selected by SOPT2[PLLFLLESEL].  
*kClockLpsciSrcOsc0erClk* OSCERCLK clock.  
*kClockLpsciSrcMcgIrClk* MCGIR clock.

### 66.2.41.3.5 enum clock\_sai\_src\_kl26z4\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.41.3.6 enum clock\_pllfl\_sel\_kl26z4\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.

## SIM HAL driver

### 66.2.41.3.7 enum clock\_er32k\_src\_kl26z4\_t

Enumerator

*kClockEr32kSrcOsc0* OSC 32k clock.  
*kClockEr32kSrcReserved* Reserved.  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.41.3.8 enum clock\_clkout\_src\_kl26z4\_t

Enumerator

*kClockClkoutReserved* Reserved.  
*kClockClkoutReserved1* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutReserved2* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

### 66.2.41.3.9 enum clock\_rtcout\_src\_kl26z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32KHz clock

### 66.2.41.3.10 enum sim\_adc\_pretrg\_sel\_kl26z4\_t

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

### 66.2.41.3.11 enum sim\_adc\_trg\_sel\_kl26z4\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved* Reserved.

*kSimAdcTrgSelReserved1* Reserved.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelReserved5* Reserved.

#### 66.2.41.3.12 enum sim\_uart\_rxsrc\_kl26z4\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.

#### 66.2.41.3.13 enum sim\_uart\_txsrc\_kl26z4\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimUartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.  
*kSimUartTxsrcReserved* Reserved.

#### 66.2.41.3.14 enum sim\_lpsci\_rxsrc\_kl26z4\_t

Enumerator

*kSimLpsciRxsrcPin* LPSCIx\_RX Pin.  
*kSimLpsciRxsrcCmp0* CMP0.

#### 66.2.41.3.15 enum sim\_lpsci\_txsrc\_kl26z4\_t

Enumerator

*kSimLpsciTxsrcPin* LPSCIx\_TX Pin.

## SIM HAL driver

*kSimLpsciTxsrcTpm1* LPSCIx\_TX pin modulated with TPM1 channel 0 output.  
*kSimLpsciTxsrcTpm2* LPSCIx\_TX pin modulated with TPM2 channel 0 output.  
*kSimLpsciTxsrcReserved* Reserved.

### 66.2.41.3.16 enum sim\_tpm\_clk\_sel\_kl26z4\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.  
*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.41.3.17 enum sim\_tpm\_ch\_src\_kl26z4\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.  
*kSimTpmChSrc1* CMP0 output.  
*kSimTpmChSrc2* Reserved.  
*kSimTpmChSrc3* USB start of frame pulse.

### 66.2.41.3.18 enum sim\_clock\_gate\_name\_kl26z4\_t

## 66.2.42 KL27Z4 SIM HAL driver

### 66.2.42.1 Overview

The section describes the enumerations, macros and data structures for KL27Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKL27Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kl27z4\\_t](#) {

## 66.2.42.2 Macro Definition Documentation

66.2.42.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.42.3 Enumeration Type Documentation

66.2.42.3.1 enum `clock_cop_src_kl27z4_t`

Enumerator

- `kClockCopSrcLpoClk` LPO clock 1K HZ.
- `kClockCopSrcMcgIrClk` MCG IRC Clock.
- `kClockCopSrcOsc0erClk` OSCER Clock.
- `kClockCopSrcBusClk` BUS clock.

66.2.42.3.2 enum `clock_er32k_src_kl27z4_t`

Enumerator

- `kClockEr32kSrcOsc0` OSC0 clock (OSC032KCLK).
- `kClockEr32kSrcRtc` RTC 32k clock .
- `kClockEr32kSrcLpo` LPO clock.

## SIM HAL driver

### 66.2.42.3.3 enum clock\_osc32kout\_sel\_kl27z4\_t

Enumerator

*kClockOsc32koutNone* ERCLK32K is not output.  
*kClockOsc32koutPte0* ERCLK32K is output on PTE0.  
*kClockOsc32koutPte26* ERCLK32K is output on PTE26.

### 66.2.42.3.4 enum clock\_lpuart\_src\_kl27z4\_t

Enumerator

*kClockLpuartSrcNone* disabled  
*kClockLpuartSrcIrc48M* IRC48M.  
*kClockLpuartSrcOsc0erClk* OSCER clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

### 66.2.42.3.5 enum clock\_tpm\_src\_kl27z4\_t

Enumerator

*kClockTpmSrcNone* disabled  
*kClockTpmSrcIrc48M* IRC48M/MCGPCLK.  
*kClockTpmSrcOsc0erClk* OSCER clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.42.3.6 enum clock\_flexio\_src\_kl27z4\_t

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcIrc48M* MCGPCLK/IRC48M.  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

### 66.2.42.3.7 enum clock\_lptmr\_src\_kl27z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.42.3.8 enum clock\_clkout\_src\_kl27z4\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelOsc0erClk* OSCER clock.  
*kClockClkoutSelIrc48M* IRC48M clock.

### 66.2.42.3.9 enum clock\_rtcout\_src\_kl27z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrcOsc0erClk* OSCER clock.

### 66.2.42.3.10 enum sim\_adc\_pretrg\_sel\_kl27z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.42.3.11 enum sim\_adc\_trg\_sel\_kl27z4\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.42.3.12 enum sim\_lpuart\_rxsrc\_kl27z4\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

## SIM HAL driver

### 66.2.42.3.13 enum sim\_lpuart\_txsrc\_kl27z4\_t

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.

*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.

*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

### 66.2.42.3.14 enum clock\_sai\_src\_kl27z4\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.

*kClockSaiSrcOsc0erClk* OSC0ERCLK.

*kClockSaiSrcMcgIrClk* MCGIRCLK.

*kClockSaiSrcIrc48M* MCGPCLK/IRC48M.

### 66.2.42.3.15 enum sim\_tpm\_clk\_sel\_kl27z4\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.42.3.16 enum sim\_tpm\_ch\_src\_kl27z4\_t

Enumerator

*kSimTpmChSrc0* Channel y input capture source uses 0.

*kSimTpmChSrc1* Channel y input capture source uses 1.

*kSimTpmChSrc2* Channel y input capture source uses 2.

*kSimTpmChSrc3* Channel y input capture source uses 3.

### 66.2.42.3.17 enum sim\_clock\_gate\_name\_kl27z4\_t

## 66.2.43 KL27Z644 SIM HAL driver

### 66.2.43.1 Overview

The section describes the enumerations, macros and data structures for KL27Z644 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKL27Z644.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kl27z644\\_t](#) {  
  [kClockCopSrcLpoClk](#),  
  [kClockCopSrcMcgIrClk](#),  
  [kClockCopSrcOsc0erClk](#),  
  [kClockCopSrcBusClk](#) }  
*COP clock source selection.*
- enum [clock\\_er32k\\_src\\_kl27z644\\_t](#) {  
  [kClockEr32kSrcOsc0](#) = 0U,

## 66.2.43.2 Macro Definition Documentation

66.2.43.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.43.3 Enumeration Type Documentation

66.2.43.3.1 `enum clock_cop_src_kl27z644_t`

Enumerator

*kClockCopSrcLpoClk* LPO clock 1K HZ.  
*kClockCopSrcMcgIrClk* MCG IRC Clock.  
*kClockCopSrcOsc0erClk* OSCER Clock.  
*kClockCopSrcBusClk* BUS clock.

66.2.43.3.2 `enum clock_er32k_src_kl27z644_t`

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

## SIM HAL driver

### 66.2.43.3.3 enum clock\_osc32kout\_sel\_kl27z644\_t

Enumerator

*kClockOsc32koutNone* ERCLK32K is not output.  
*kClockOsc32koutPte0* ERCLK32K output on PTE0.

### 66.2.43.3.4 enum clock\_lpuart\_src\_kl27z644\_t

Enumerator

*kClockLpuartSrcNone* disabled  
*kClockLpuartSrcIrc48M* IRC48M.  
*kClockLpuartSrcOsc0erClk* OSCER clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

### 66.2.43.3.5 enum clock\_tpm\_src\_kl27z644\_t

Enumerator

*kClockTpmSrcNone* disabled  
*kClockTpmSrcIrc48M* IRC48M/MCGPCLK.  
*kClockTpmSrcOsc0erClk* OSCER clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.43.3.6 enum clock\_usbfs\_src\_kl27z644\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)  
*kClockUsbfsSrcIrc48M* IRC48/MCGPCLK.

### 66.2.43.3.7 enum clock\_flexio\_src\_kl27z644\_t

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcIrc48M* MCGPCLK/IRC48M.  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

### 66.2.43.3.8 enum clock\_lptmr\_src\_kl27z644\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.43.3.9 enum clock\_clkout\_src\_kl27z644\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelOsc0erClk* OSCER clock.  
*kClockClkoutSelIrc48M* IRC48M clock.

### 66.2.43.3.10 enum clock\_rtcout\_src\_kl27z644\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrcOsc0erClk* OSCER clock.

### 66.2.43.3.11 enum sim\_adc\_pretrg\_sel\_kl27z644\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.43.3.12 enum sim\_adc\_trg\_sel\_kl27z644\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.

## SIM HAL driver

*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.43.3.13 enum sim\_lpuart\_rxsrc\_kl27z644\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

### 66.2.43.3.14 enum sim\_lpuart\_txsrc\_kl27z644\_t

Enumerator

*kSimLpuartTxsrcPin* UARTx\_TX Pin.  
*kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

### 66.2.43.3.15 enum sim\_tpm\_clk\_sel\_kl27z644\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.  
*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.43.3.16 enum sim\_tpm\_ch\_src\_kl27z644\_t

Enumerator

*kSimTpmChSrc0* Channel y input capture source uses 0.  
*kSimTpmChSrc1* Channel y input capture source uses 1.  
*kSimTpmChSrc2* Channel y input capture source uses 2.  
*kSimTpmChSrc3* Channel y input capture source uses 3.

### 66.2.43.3.17 enum sim\_clock\_gate\_name\_kl27z644\_t

## 66.2.44 KL28T7 SIM HAL driver

### 66.2.44.1 Overview

The section describes the enumerations, macros and data structures for KL28T7 SIM HAL driver.

#### Files

## SIM HAL driver

### 66.2.44.2 Enumeration Type Documentation

#### 66.2.44.2.1 enum clock\_wdog\_src\_kl28t7\_t

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

#### 66.2.44.2.2 enum clock\_trace\_src\_kl28t7\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

#### 66.2.44.2.3 enum clock\_port\_filter\_src\_kl28t7\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.

*kClockPortFilterSrcLpoClk* LPO.

#### 66.2.44.2.4 enum clock\_lptmr\_src\_kl28t7\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

#### 66.2.44.2.5 enum clock\_sai\_src\_kl28t7\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.

*kClockSaiSrcOsc0erClk* OSC0ERCLK.

*kClockSaiSrcPllFllSel* MCGPLLCLK.

**66.2.44.2.6 enum clock\_pllfl\_sel\_kl28t7\_t**

Enumerator

*kClockPlIFllSelFll* Fll clock.  
*kClockPlIFllSelPll* Pll0 clock.  
*kClockPlIFllSelIrc48M* IRC48MCLK.

**66.2.44.2.7 enum clock\_er32k\_src\_kl28t7\_t**

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

**66.2.44.2.8 enum clock\_rtcout\_src\_kl28t7\_t**

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

**66.2.44.2.9 enum clock\_osc32kout\_sel\_kl28t7\_t**

Enumerator

*kClockOsc32koutNone* ERCLK32K is not output.  
*kClockOsc32koutPte0* ERCLK32K is output on PTE0.  
*kClockOsc32koutPte26* ERCLK32K is output on PTE26.

**66.2.44.2.10 enum sim\_usbsstby\_mode\_kl28t7\_t**

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes  
*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes

**66.2.44.2.11 enum sim\_usbvstby\_mode\_kl28t7\_t**

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes  
*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes

## SIM HAL driver

### 66.2.44.2.12 enum sim\_adc\_pretrg\_sel\_kl28t7\_t

Enumerator

- kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.
- kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.44.2.13 enum sim\_adc\_trg\_sel\_kl28t7\_t

Enumerator

- kSimAdcTrgSelExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelPit0* PIT trigger 0.
- kSimAdcTrgSelPit1* PIT trigger 1.
- kSimAdcTrgSelPit2* PIT trigger 2.
- kSimAdcTrgSelPit3* PIT trigger 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.
- kSimAdcTrgSelRtcAlarm* RTC alarm.
- kSimAdcTrgSelRtcSec* RTC seconds.
- kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.44.2.14 enum sim\_lpuart\_rxsrc\_kl28t7\_t

Enumerator

- kSimLpuartRxsrcPin* LPUARTx\_RX Pin.
- kSimLpuartRxsrcCmp0* CMP0.
- kSimLpuartRxsrcCmp1* CMP1.

### 66.2.44.2.15 enum sim\_uart\_rxsrc\_kl28t7\_t

Enumerator

- kSimUartRxsrcPin* UARTx\_RX Pin.
- kSimUartRxsrcCmp0* CMP0.
- kSimUartRxsrcCmp1* CMP1.

**66.2.44.2.16 enum sim\_uart\_txsrc\_kl28t7\_t**

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.**66.2.44.2.17 enum sim\_ftm\_trg\_src\_kl28t7\_t**

Enumerator

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.*kSimFtmFltSel1* FlexTimer x fault y select 1.

## SIM HAL driver

### 66.2.44.2.22 enum sim\_tpm\_clk\_sel\_kl28t7\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.44.2.23 enum sim\_tpm\_ch\_src\_kl28t7\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.

*kSimTpmChSrc1* CMPO output.

### 66.2.44.2.24 enum sim\_cmtuartpad\_strenght\_kl28t7\_t

Enumerator

*kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.

*kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.

### 66.2.44.2.25 enum sim\_ptd7pad\_strenght\_kl28t7\_t

Enumerator

*kSimPtd7padSinglePad* Single-pad drive strength for PTD7.

*kSimPtd7padDualPad* Dual-pad drive strength for PTD7.

### **66.2.45 KL28Z7 SIM HAL driver**

The section describes the enumerations, macros and data structures for KL28Z7 SIM HAL driver.

## SIM HAL driver

### 66.2.46 KL33Z4 SIM HAL driver

#### 66.2.46.1 Overview

The section describes the enumerations, macros and data structures for KL33Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKL33Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

### 66.2.46.2 Macro Definition Documentation

66.2.46.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.46.3 Enumeration Type Documentation

#### 66.2.46.3.1 enum `clock_cop_src_kl33z4_t`

Enumerator

`kClockCopSrcLpoClk` LPO clock 1K HZ.  
`kClockCopSrcMcgIrClk` MCG IRC Clock.  
`kClockCopSrcOsc0erClk` OSCER Clock.  
`kClockCopSrcBusClk` BUS clock.

#### 66.2.46.3.2 enum `clock_er32k_src_kl33z4_t`

Enumerator

`kClockEr32kSrcOsc0` OSC0 clock (OSC032KCLK).  
`kClockEr32kSrcRtc` RTC 32k clock .  
`kClockEr32kSrcLpo` LPO clock.

### 66.2.46.3.3 enum clock\_osc32kout\_sel\_kl33z4\_t

Enumerator

*kClockOsc32koutNone* ERCLK32K is not output.  
*kClockOsc32koutPte0* ERCLK32K is output on PTE0.  
*kClockOsc32koutPte26* ERCLK32K is output on PTE26.

### 66.2.46.3.4 enum clock\_lpuart\_src\_kl33z4\_t

Enumerator

*kClockLpuartSrcNone* disabled  
*kClockLpuartSrcIrc48M* IRC48M.  
*kClockLpuartSrcOsc0erClk* OSCER clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

### 66.2.46.3.5 enum clock\_tpm\_src\_kl33z4\_t

Enumerator

*kClockTpmSrcNone* disabled  
*kClockTpmSrcIrc48M* IRC48M/MCGPCLK.  
*kClockTpmSrcOsc0erClk* OSCER clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.46.3.6 enum clock\_flexio\_src\_kl33z4\_t

Enumerator

*kClockFlexioSrcNone* Clock disabled.  
*kClockFlexioSrcIrc48M* MCGPCLK/IRC48M.  
*kClockFlexioSrcOsc0erClk* OSCERCLK.  
*kClockFlexioSrcMcgIrClk* MCGIRCLK.

### 66.2.46.3.7 enum clock\_lptmr\_src\_kl33z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

## SIM HAL driver

### 66.2.46.3.8 enum clock\_clkout\_src\_kl33z4\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelOsc0erClk* OSCER clock.  
*kClockClkoutSelIrc48M* IRC48M clock.

### 66.2.46.3.9 enum clock\_rtcout\_src\_kl33z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrcOsc0erClk* OSCER clock.

### 66.2.46.3.10 enum sim\_adc\_pretrg\_sel\_kl33z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.46.3.11 enum sim\_adc\_trg\_sel\_kl33z4\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.46.3.12 enum sim\_lpuart\_rxsrc\_kl33z4\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

**66.2.46.3.13 enum sim\_lpuart\_txsrc\_kl33z4\_t**

Enumerator

- kSimLpuartTxsrcPin* UARTx\_TX Pin.
- kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.
- kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

**66.2.46.3.14 enum clock\_sai\_src\_kl33z4\_t**

Enumerator

- kClockSaiSrcSysClk* SYSCLK.
- kClockSaiSrcOsc0erClk* OSC0ERCLK.
- kClockSaiSrcMcgIrClk* MCGIRCLK.
- kClockSaiSrcIrc48M* MCGPCLK/IRC48M.

**66.2.46.3.15 enum sim\_tpm\_clk\_sel\_kl33z4\_t**

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

**66.2.46.3.16 enum sim\_tpm\_ch\_src\_kl33z4\_t**

Enumerator

- kSimTpmChSrc0* Channel y input capture source uses 0.
- kSimTpmChSrc1* Channel y input capture source uses 1.
- kSimTpmChSrc2* Channel y input capture source uses 2.
- kSimTpmChSrc3* Channel y input capture source uses 3.

**66.2.46.3.17 enum sim\_clock\_gate\_name\_kl33z4\_t**

## SIM HAL driver

### 66.2.47 KL33Z644 SIM HAL driver

#### 66.2.47.1 Overview

The section describes the enumerations, macros and data structures for KL33Z644 SIM HAL driver.

#### Files

- file `fsl_sim_hal_MKL33Z644.h`

#### Macros

- #define `FSL_SIM_SCGC_BIT(SCGCx, n)` (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum `clock_cop_src_kl33z644_t` {

### 66.2.48.2 Macro Definition Documentation

66.2.48.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.48.3 Enumeration Type Documentation

66.2.48.3.1 enum `clock_cop_src_kl34z4_t`

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KL34Z4 it is Bus clock.

### 66.2.48.3.2 enum clock\_tpm\_src\_kl34z4\_t

Enumerator

*kClockTpmSrcNone* clock disabled  
*kClockTpmSrcPllFllSel* clock as selected by SOPT2[PLLFLLESEL].  
*kClockTpmSrcOsc0erClk* OSCERCLK clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.48.3.3 enum clock\_lptmr\_src\_kl34z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.48.3.4 enum clock\_lpsci\_src\_kl34z4\_t

Enumerator

*kClockLpsciSrcNone* clock disabled  
*kClockLpsciSrcPllFllSel* clock as selected by SOPT2[PLLFLLESEL].  
*kClockLpsciSrcOsc0erClk* OSCERCLK clock.  
*kClockLpsciSrcMcgIrClk* MCGIR clock.

### 66.2.48.3.5 enum clock\_sai\_src\_kl34z4\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.48.3.6 enum clock\_pllfl\_sel\_kl34z4\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.

## SIM HAL driver

### 66.2.48.3.7 enum clock\_er32k\_src\_kl34z4\_t

Enumerator

*kClockEr32kSrcOsc0* OSC 32k clock.  
*kClockEr32kSrcReserved* Reserved.  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.48.3.8 enum clock\_clkout\_src\_kl34z4\_t

Enumerator

*kClockClkoutReserved* Reserved.  
*kClockClkoutReserved1* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutReserved2* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

### 66.2.48.3.9 enum clock\_rtcout\_src\_kl34z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32KHz clock

### 66.2.48.3.10 enum sim\_adc\_pretrg\_sel\_kl34z4\_t

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

### 66.2.48.3.11 enum sim\_adc\_trg\_sel\_kl34z4\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved* Reserved.

*kSimAdcTrgSelReserved1* Reserved.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelReserved5* Reserved.

#### 66.2.48.3.12 enum sim\_uart\_rxsrc\_kl34z4\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.

#### 66.2.48.3.13 enum sim\_uart\_txsrc\_kl34z4\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimUartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.  
*kSimUartTxsrcReserved* Reserved.

#### 66.2.48.3.14 enum sim\_lpsci\_rxsrc\_kl34z4\_t

Enumerator

*kSimLpsciRxsrcPin* LPSCIx\_RX Pin.  
*kSimLpsciRxsrcCmp0* CMP0.

#### 66.2.48.3.15 enum sim\_lpsci\_txsrc\_kl34z4\_t

Enumerator

*kSimLpsciTxsrcPin* LPSCIx\_TX Pin.

## SIM HAL driver

*kSimLpsciTxsrcTpm1* LPSCIx\_TX pin modulated with TPM1 channel 0 output.

*kSimLpsciTxsrcTpm2* LPSCIx\_TX pin modulated with TPM2 channel 0 output.

*kSimLpsciTxsrcReserved* Reserved.

### 66.2.48.3.16 enum sim\_tpm\_clk\_sel\_kl34z4\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.48.3.17 enum sim\_tpm\_ch\_src\_kl34z4\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.

*kSimTpmChSrc1* CMP0 output.

*kSimTpmChSrc2* Reserved.

*kSimTpmChSrc3* USB start of frame pulse.

### 66.2.48.3.18 enum sim\_clock\_gate\_name\_kl34z4\_t

### 66.2.50.2 Macro Definition Documentation

66.2.50.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.50.3 Enumeration Type Documentation

#### 66.2.50.3.1 enum `clock_cop_src_kl43z4_t`

Enumerator

`kClockCopSrcLpoClk` LPO clock 1K HZ.  
`kClockCopSrcMcgIrClk` MCG IRC Clock.  
`kClockCopSrcOsc0erClk` OSCER Clock.  
`kClockCopSrcBusClk` BUS clock.

#### 66.2.50.3.2 enum `clock_er32k_src_kl43z4_t`

Enumerator

`kClockEr32kSrcOsc0` OSC0 clock (OSC032KCLK).  
`kClockEr32kSrcRtc` RTC 32k clock .  
`kClockEr32kSrcLpo` LPO clock.

### 66.2.50.3.3 enum clock\_osc32kout\_sel\_kl43z4\_t

Enumerator

- kClockOsc32koutNone* ERCLK32K is not output.
- kClockOsc32koutPte0* ERCLK32K is output on PTE0.
- kClockOsc32koutPte26* ERCLK32K is output on PTE26.

### 66.2.50.3.4 enum clock\_lpuart\_src\_kl43z4\_t

Enumerator

- kClockLpuartSrcNone* disabled
- kClockLpuartSrcIrc48M* IRC48M.
- kClockLpuartSrcOsc0erClk* OSCER clock.
- kClockLpuartSrcMcgIrClk* MCGIR clock.

### 66.2.50.3.5 enum clock\_tpm\_src\_kl43z4\_t

Enumerator

- kClockTpmSrcNone* disabled
- kClockTpmSrcIrc48M* IRC48M/MCGPCLK.
- kClockTpmSrcOsc0erClk* OSCER clock.
- kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.50.3.6 enum clock\_flexio\_src\_kl43z4\_t

Enumerator

- kClockFlexioSrcNone* Clock disabled.
- kClockFlexioSrcIrc48M* MCGPCLK/IRC48M.
- kClockFlexioSrcOsc0erClk* OSCERCLK.
- kClockFlexioSrcMcgIrClk* MCGIRCLK.

### 66.2.50.3.7 enum clock\_lptmr\_src\_kl43z4\_t

Enumerator

- kClockLptmrSrcMcgIrClk* MCG out clock.
- kClockLptmrSrcLpoClk* LPO clock.
- kClockLptmrSrcEr32kClk* ERCLK32K clock.
- kClockLptmrSrcOsc0erClk* OSCERCLK clock.

## SIM HAL driver

### 66.2.50.3.8 enum clock\_clkout\_src\_kl43z4\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelOsc0erClk* OSCER clock.  
*kClockClkoutSelIrc48M* IRC48M clock.

### 66.2.50.3.9 enum clock\_rtcout\_src\_kl43z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrcOsc0erClk* OSCER clock.

### 66.2.50.3.10 enum sim\_adc\_pretrg\_sel\_kl43z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.50.3.11 enum sim\_adc\_trg\_sel\_kl43z4\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.50.3.12 enum sim\_lpuart\_rxsrc\_kl43z4\_t

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

### 66.2.50.3.13 enum sim\_lpuart\_txsrc\_kl43z4\_t

Enumerator

- kSimLpuartTxsrcPin* UARTx\_TX Pin.
- kSimLpuartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.
- kSimLpuartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.

### 66.2.50.3.14 enum clock\_sai\_src\_kl43z4\_t

Enumerator

- kClockSaiSrcSysClk* SYSCLK.
- kClockSaiSrcOsc0erClk* OSC0ERCLK.
- kClockSaiSrcMcgIrClk* MCGIRCLK.
- kClockSaiSrcIrc48M* MCGPCLK/IRC48M.

### 66.2.50.3.15 enum sim\_tpm\_clk\_sel\_kl43z4\_t

Enumerator

- kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.
- kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.50.3.16 enum sim\_tpm\_ch\_src\_kl43z4\_t

Enumerator

- kSimTpmChSrc0* Channel y input capture source uses 0.
- kSimTpmChSrc1* Channel y input capture source uses 1.
- kSimTpmChSrc2* Channel y input capture source uses 2.
- kSimTpmChSrc3* Channel y input capture source uses 3.

### 66.2.50.3.17 enum sim\_clock\_gate\_name\_kl43z4\_t

## SIM HAL driver

### 66.2.51 KL46Z4 SIM HAL driver

#### 66.2.51.1 Overview

The section describes the enumerations, macros and data structures for KL46Z4 SIM HAL driver.

#### Files

### 66.2.51.2 Macro Definition Documentation

66.2.51.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.51.3 Enumeration Type Documentation

66.2.51.3.1 `enum clock_cop_src_kl46z4_t`

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KL46Z4 it is Bus clock.

### 66.2.51.3.2 enum clock\_tpm\_src\_kl46z4\_t

Enumerator

*kClockTpmSrcNone* clock disabled  
*kClockTpmSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockTpmSrcOsc0erClk* OSCERCLK clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.51.3.3 enum clock\_lptmr\_src\_kl46z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.51.3.4 enum clock\_lpsci\_src\_kl46z4\_t

Enumerator

*kClockLpsciSrcNone* clock disabled  
*kClockLpsciSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockLpsciSrcOsc0erClk* OSCERCLK clock.  
*kClockLpsciSrcMcgIrClk* MCGIR clock.

### 66.2.51.3.5 enum clock\_sai\_src\_kl46z4\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.51.3.6 enum clock\_pllfl\_sel\_kl46z4\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.

## SIM HAL driver

### 66.2.51.3.7 enum clock\_er32k\_src\_kl46z4\_t

Enumerator

*kClockEr32kSrcOsc0* OSC 32k clock.  
*kClockEr32kSrcReserved* Reserved.  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.51.3.8 enum clock\_clkout\_src\_kl46z4\_t

Enumerator

*kClockClkoutReserved* Reserved.  
*kClockClkoutReserved1* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutReserved2* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

### 66.2.51.3.9 enum clock\_rtcout\_src\_kl46z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32KHz clock

### 66.2.51.3.10 enum sim\_adc\_pretrg\_sel\_kl46z4\_t

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

### 66.2.51.3.11 enum sim\_adc\_trg\_sel\_kl46z4\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved* Reserved.

*kSimAdcTrgSelReserved1* Reserved.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelReserved5* Reserved.

#### 66.2.51.3.12 enum sim\_uart\_rxsrc\_kl46z4\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.

#### 66.2.51.3.13 enum sim\_uart\_txsrc\_kl46z4\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimUartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.  
*kSimUartTxsrcReserved* Reserved.

#### 66.2.51.3.14 enum sim\_lpsci\_rxsrc\_kl46z4\_t

Enumerator

*kSimLpsciRxsrcPin* LPSCIx\_RX Pin.  
*kSimLpsciRxsrcCmp0* CMP0.

#### 66.2.51.3.15 enum sim\_lpsci\_txsrc\_kl46z4\_t

Enumerator

*kSimLpsciTxsrcPin* LPSCIx\_TX Pin.

## SIM HAL driver

*kSimLpsciTxsrcTpm1* LPSCIx\_TX pin modulated with TPM1 channel 0 output.

*kSimLpsciTxsrcTpm2* LPSCIx\_TX pin modulated with TPM2 channel 0 output.

*kSimLpsciTxsrcReserved* Reserved.

### 66.2.51.3.16 enum sim\_tpm\_clk\_sel\_kl46z4\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.

*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

### 66.2.51.3.17 enum sim\_tpm\_ch\_src\_kl46z4\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.

*kSimTpmChSrc1* CMP0 output.

*kSimTpmChSrc2* Reserved.

*kSimTpmChSrc3* USB start of frame pulse.

### 66.2.51.3.18 enum sim\_clock\_gate\_name\_kl46z4\_t

## 66.2.52 KM34Z7 SIM HAL driver

### 66.2.52.1 Overview

The section describes the enumerations, macros and data structures for KM34Z7 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKM34Z7.h](#)

#### Enumerations

- enum `clock_wdog_src_t` { ,

## IP related clock feature APIs

- static void [SIM\\_HAL\\_EnableClock](#) (SIM\_Type \*base, [sim\\_clock\\_gate\\_name\\_t](#) name)  
*Enable the clock for specific module.*
- static void [SIM\\_HAL\\_DisableClock](#) (SIM\_Type \*base, [sim\\_clock\\_gate\\_name\\_t](#) name)  
*Disable the clock for specific module.*
- static bool [SIM\\_HAL\\_GetGateCmd](#) (SIM\_Type \*base, [sim\\_clock\\_gate\\_name\\_t](#) name)  
*Get the the clock gate state for specific module.*
- static uint32\_t [SIM\\_HAL\\_GetSRamSize](#) (SIM\_Type \*base)  
*Gets the Kinetis system RAM size in the System Options register 1(SIM\_SOPT1).*
- static void [CLOCK\\_HAL\\_SetExternalRefClock32kSrc](#) (SIM\_Type \*base, [clock\\_er32k\\_src\\_t](#) setting)  
*Set the clock selection of ERCLK32K.*
- static [clock\\_er32k\\_src\\_t](#) [CLOCK\\_HAL\\_GetExternalRefClock32kSrc](#) (SIM\_Type \*base)  
*Get the clock selection of ERCLK32K.*
- static void [SIM\\_HAL\\_SetRamBitlinePrechargeCmd](#) (SIM\_Type \*base, bool enable)  
*Sets the RAM Bitline Precharge enable setting.*
- static bool [SIM\\_HAL\\_GetRamBitlinePrechargeCmd](#) (SIM\_Type \*base)  
*Gets the RAM Bitline Precharge enable setting.*
- static void [SIM\\_HAL\\_SetRamSrcBiasCmd](#) (SIM\_Type \*base, bool disable)  
*Sets the source bias of SRAM arrays enable setting.*

## SIM HAL driver

- static bool [SIM\\_HAL\\_GetRamSrcBiasCmd](#) (SIM\_Type \*base)  
*Gets the source bias of SRAM arrays enable setting.*
- void [SIM\\_HAL\\_SetLptmrChSelMode](#) (SIM\_Type \*base, uint8\_t channel, [sim\\_lptmr\\_src\\_sel\\_t](#) select)  
*Sets the LPTMR channel x source select setting.*
- [sim\\_lptmr\\_src\\_sel\\_t](#) [SIM\\_HAL\\_GetLptmrChSelMode](#) (SIM\_Type \*base, uint8\_t channel)  
*Gets the LPTMR channel x source select setting.*
- static void [CLOCK\\_HAL\\_SetClkOutSel](#) (SIM\_Type \*base, [clock\\_clkout\\_src\\_t](#) setting)  
*Set CLKOUTSEL selection.*
- static [clock\\_clkout\\_src\\_t](#) [CLOCK\\_HAL\\_GetClkOutSel](#) (SIM\_Type \*base)  
*Get CLKOUTSEL selection.*
- static void [CLOCK\\_HAL\\_SetSAdcTrgClkSel](#) (SIM\_Type \*base, [sim\\_sadc\\_trg\\_clk\\_sel\\_t](#) setting)  
*Set SAR ADC trigger clock selection.*
- static [sim\\_sadc\\_trg\\_clk\\_sel\\_t](#) [CLOCK\\_HAL\\_GetSAdcTrgClkSel](#) (SIM\_Type \*base)  
*Get the SAR ADC trigger clock selection.*
- static void [CLOCK\\_HAL\\_SetTmrCntFreezeCmd](#) (SIM\_Type \*base, [sim\\_tmr\\_cnt\\_freeze\\_sel\\_t](#) setting)  
*Set TMR counter freeze setting.*
- static [sim\\_tmr\\_cnt\\_freeze\\_sel\\_t](#) [CLOCK\\_HAL\\_GetTmrCntFreezeCmd](#) (SIM\_Type \*base)  
*Get the TMR counter freeze setting.*
- static void [CLOCK\\_HAL\\_SetLpuartClkSel](#) (SIM\_Type \*base, [clock\\_lpuart\\_src\\_t](#) setting)  
*Set LPUART clock source selection.*
- static [clock\\_lpuart\\_src\\_t](#) [CLOCK\\_HAL\\_GetLpuartClkSel](#) (SIM\_Type \*base)  
*Get the LPUART clock source selection.*
- static void [CLOCK\\_HAL\\_SetAfeOutDivCmd](#) (SIM\_Type \*base, [sim\\_afe\\_clk\\_div\\_sel\\_t](#) setting)  
*Set AFE output clock dividing setting.*
- static [sim\\_afe\\_clk\\_div\\_sel\\_t](#) [CLOCK\\_HAL\\_GetAfeOutDivCmd](#) (SIM\_Type \*base)  
*Get the AFE output clock dividing setting.*
- static void [CLOCK\\_HAL\\_SetXbarOutSel](#) (SIM\_Type \*base, [clock\\_xbar\\_out\\_src\\_t](#) setting)  
*Set XBARCLKOUT selection.*
- static [clock\\_xbar\\_out\\_src\\_t](#) [CLOCK\\_HAL\\_GetXbarOutSel](#) (SIM\_Type \*base)  
*Get XBARCLKOUT selection.*
- static void [CLOCK\\_HAL\\_SetPllfllSel](#) (SIM\_Type \*base, [clock\\_pllfl\\_sel\\_t](#) setting)  
*Set PLL/FLL clock selection.*
- static [clock\\_pllfl\\_sel\\_t](#) [CLOCK\\_HAL\\_GetPllfllSel](#) (SIM\_Type \*base)  
*Get PLL/FLL clock selection.*
- void [CLOCK\\_HAL\\_SetSpiOutInvCmd](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t inv\_type, [sim\\_spi\\_out\\_invert\\_sel\\_t](#) setting)  
*Set SPI output signal inverting setting.*
- [sim\\_spi\\_out\\_invert\\_sel\\_t](#) [CLOCK\\_HAL\\_GetSpiOutInvCmd](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t inv\_type)  
*Get the SPI output signal inverting setting.*
- static void [SIM\\_HAL\\_SetPllInVlpCmd](#) (SIM\_Type \*base, bool enable)  
*Sets the PLL VLP enable setting.*
- static bool [SIM\\_HAL\\_GetPllInVlpCmd](#) (SIM\_Type \*base)  
*Gets the PLL VLP enable setting.*
- static void [SIM\\_HAL\\_SetNmiDisCmd](#) (SIM\_Type \*base, bool disable)  
*Sets the NMI feature enable setting.*
- static bool [SIM\\_HAL\\_GetNmiDisCmd](#) (SIM\_Type \*base)  
*Gets the NMI feature enable setting.*
- static uint32\_t [SIM\\_HAL\\_GetFamilyId](#) (SIM\_Type \*base)

- Gets the Kinetis Family ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t **SIM\_HAL\_GetSubFamilyId** (SIM\_Type \*base)
- Gets the Kinetis Sub-Family ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t **SIM\_HAL\_GetSeriesId** (SIM\_Type \*base)
- Gets the Kinetis SeriesID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t **SIM\_HAL\_GetAttributeId** (SIM\_Type \*base)
- Gets the Attribute ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t **SIM\_HAL\_GetSRamSizeId** (SIM\_Type \*base)
- Gets the SRAM SIZE in the System Device ID register (SIM\_SDID).*

  - static uint32\_t **SIM\_HAL\_GetRevId** (SIM\_Type \*base)
- Gets the Kinetis Revision ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t **SIM\_HAL\_GetDieId** (SIM\_Type \*base)
- Gets the Kinetis Die ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t **SIM\_HAL\_GetPinCntId** (SIM\_Type \*base)
- Gets the Kinetis Pincount ID in System Device ID register (SIM\_SDID).*

  - static void **CLOCK\_HAL\_SetSysDiv** (SIM\_Type \*base, uint8\_t setting)

*Set system clock divider.*

  - static uint8\_t **CLOCK\_HAL\_GetSysDiv** (SIM\_Type \*base)

*Get SYSDIV.*

  - static void **CLOCK\_HAL\_SetBusDiv** (SIM\_Type \*base, uint8\_t setting)

*Set BUS clock divider.*

  - static uint8\_t **CLOCK\_HAL\_GetBusDiv** (SIM\_Type \*base)

*Get BUS clock divider value.*

  - static void **CLOCK\_HAL\_SetFlashClkMode** (SIM\_Type \*base, uint8\_t setting)

*Set FLASH clock mode.*

  - static uint8\_t **CLOCK\_HAL\_GetFlashClkMode** (SIM\_Type \*base)

*Get FLASH clock mode value.*

  - void **CLOCK\_HAL\_SetOutDiv** (SIM\_Type \*base, uint8\_t sysDiv, uint8\_t busDiv, uint8\_t flashclkmode)

*Set all clock out dividers setting at one time.*

  - void **CLOCK\_HAL\_GetOutDiv** (SIM\_Type \*base, uint8\_t \*sysDiv, uint8\_t \*busDiv, uint8\_t \*flashclkmode)

*Get all clock out dividers setting at one time.*

  - static uint32\_t **SIM\_HAL\_GetProgramFlashSize** (SIM\_Type \*base)

*Gets the program flash size in the Flash Configuration Register 1 (SIM\_FCFG).*

  - static void **SIM\_HAL\_SetFlashDoze** (SIM\_Type \*base, uint32\_t setting)

*Sets the Flash Doze in the Flash Configuration Register 1 (SIM\_FCFG).*

  - static uint32\_t **SIM\_HAL\_GetFlashDoze** (SIM\_Type \*base)

*Gets the Flash Doze in the Flash Configuration Register 1 (SIM\_FCFG).*

  - static void **SIM\_HAL\_SetFlashDisableCmd** (SIM\_Type \*base, bool disable)

*Sets the Flash disable setting.*

  - static bool **SIM\_HAL\_GetRamSize** (SIM\_Type \*base)

*Gets the RAM size.*

  - static bool **SIM\_HAL\_GetFlashDisableCmd** (SIM\_Type \*base)

*Gets the Flash disable setting.*

  - static uint32\_t **SIM\_HAL\_GetFlashMaxAddrBlock0** (SIM\_Type \*base)

*Gets the Flash maximum address block in the Flash Configuration Register 2(SIM\_FCFG2).*

  - static void **SIM\_HAL\_SetVrefBuffPowerDownCmd** (SIM\_Type \*base, bool enable)

*Sets the VrefBuffer enable setting.*

  - static bool **SIM\_HAL\_GetVrefBuffPowerDownCmd** (SIM\_Type \*base)

*Gets the VrefBuffer enable setting.*

## SIM HAL driver

- static void [CLOCK\\_HAL\\_SetVrefBuffInputSel](#) (SIM\_Type \*base, [sim\\_vref\\_buff\\_input\\_sel\\_t](#) setting)  
*Set the VrefBuffer input selection.*
- static [sim\\_vref\\_buff\\_input\\_sel\\_t](#) [CLOCK\\_HAL\\_GetVrefBuffInputSel](#) (SIM\_Type \*base)  
*Get the VrefBuffer input selection.*
- static void [SIM\\_HAL\\_SetVrefBuffOutCmd](#) (SIM\_Type \*base, bool enable)  
*Sets the VrefBuffer Output enable setting.*
- static bool [SIM\\_HAL\\_GetVrefBuffOutCmd](#) (SIM\_Type \*base)  
*Gets the VrefBuffer Output enable setting.*
- static void [CLOCK\\_HAL\\_SetRtcClkSel](#) (SIM\_Type \*base, [clock\\_rtcout\\_src\\_t](#) setting)  
*Set the RTC clock source selection for RTC operation.*
- static [clock\\_rtcout\\_src\\_t](#) [CLOCK\\_HAL\\_GetRtcClkSel](#) (SIM\_Type \*base)  
*Get the RTC clock source selection for RTC operation.*
- void [SIM\\_HAL\\_SetTmrPrimaryCntSrcSelMode](#) (SIM\_Type \*base, uint8\_t channel, [sim\\_tmr\\_Primary\\_src\\_sel\\_t](#) select)  
*Sets the Quadtimer channel x Primary Count source select setting.*
- [sim\\_tmr\\_Primary\\_src\\_sel\\_t](#) [SIM\\_HAL\\_GetTmrPrimaryCntSrcSelMode](#) (SIM\_Type \*base, uint8\_t channel)  
*Gets the Quadtimer channel x Primary Count source select setting.*
- void [SIM\\_HAL\\_SetTmrSecondCntSrcSelMode](#) (SIM\_Type \*base, uint8\_t channel, [sim\\_tmr\\_sencond\\_src\\_sel\\_t](#) select)  
*Sets the Quadtimer channel x Secondary Count source select setting.*
- [sim\\_tmr\\_sencond\\_src\\_sel\\_t](#) [SIM\\_HAL\\_GetTmrSecondCntSrcSelMode](#) (SIM\_Type \*base, uint8\_t channel)  
*Gets the Quadtimer channel x Secondary Count source select setting.*
- static void [SIM\\_HAL\\_SetTmr0PlIClkSelMode](#) (SIM\_Type \*base, [clock\\_tmr0\\_pll\\_src\\_t](#) select)  
*Sets the Timer0 CH0 PLL clock source select setting.*
- static [clock\\_tmr0\\_pll\\_src\\_t](#) [SIM\\_HAL\\_GetTmr0PlIClkSelMode](#) (SIM\_Type \*base)  
*Gets the Timer0 CH0 PLL clock source select setting.*
- static void [SIM\\_HAL\\_SetEwmInputSelMode](#) (SIM\_Type \*base, [sim\\_ewm\\_input\\_sel\\_t](#) select)  
*Sets the EWM input select setting.*
- static [sim\\_ewm\\_input\\_sel\\_t](#) [SIM\\_HAL\\_GetEwmInputSelMode](#) (SIM\_Type \*base)  
*Gets the EWM input select setting.*
- void [SIM\\_HAL\\_SetUartIrdaSelMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_uart\\_irda\\_sel\\_t](#) select)  
*Sets the UART x IRDA select setting.*
- [sim\\_uart\\_irda\\_sel\\_t](#) [SIM\\_HAL\\_GetUartIrdaSelMode](#) (SIM\_Type \*base, uint32\_t instance)  
*Gets the UART x IRDA select setting.*
- static void [SIM\\_HAL\\_SetUartModTypeSelMode](#) (SIM\_Type \*base, [sim\\_uart\\_irda\\_type\\_sel\\_t](#) select)  
*Sets the UART modulation select setting.*
- static [sim\\_uart\\_irda\\_type\\_sel\\_t](#) [SIM\\_HAL\\_GetUartModTypeSelMode](#) (SIM\_Type \*base)  
*Gets the UART modulation select setting.*
- static void [SIM\\_HAL\\_SetAfeClkPadDirCmd](#) (SIM\_Type \*base, [sim\\_afe\\_clk\\_pad\\_dir\\_t](#) setting)  
*Sets the AFE clock Pad direction setting.*
- static [sim\\_afe\\_clk\\_pad\\_dir\\_t](#) [SIM\\_HAL\\_GetAfeClkPadDirCmd](#) (SIM\_Type \*base)  
*Gets the AFE clock Pad direction setting.*
- static void [CLOCK\\_HAL\\_SetAfeClkSrc](#) (SIM\_Type \*base, [clock\\_afe\\_src\\_t](#) select)  
*Set the clock selection of AFECLKSEL.*
- static [clock\\_afe\\_src\\_t](#) [CLOCK\\_HAL\\_GetAfeClkSrc](#) (SIM\_Type \*base)

- Get the clock source selection of AFECLKSEL.*
- static void [SIM\\_HAL\\_SetDmaDoneSelMode](#) (SIM\_Type \*base, [sim\\_dma\\_done\\_sel\\_t](#) select)  
*Sets the DMA Done select setting.*
- static [sim\\_dma\\_done\\_sel\\_t](#) [SIM\\_HAL\\_GetDmaDoneSelMode](#) (SIM\_Type \*base)  
*Gets the DMA Done select setting.*
- static void [SIM\\_HAL\\_SetAdcTrgSelMode](#) (SIM\_Type \*base, [sim\\_adc\\_trg\\_src\\_sel\\_t](#) select)  
*Sets the ADC trigger source setting.*
- static [sim\\_adc\\_trg\\_src\\_sel\\_t](#) [SIM\\_HAL\\_GetAdcTrgSelMode](#) (SIM\_Type \*base)  
*Gets the ADC trigger source setting.*
- static bool [SIM\\_HAL\\_GetRtcOscStatusCmd](#) (SIM\_Type \*base)  
*Gets the status of RTC oscillator.*
- uint16\_t [SIM\\_HAL\\_GetAdcCompensationValueCmd](#) (SIM\_Type \*base, uint8\_t temperature)  
*Gets the ADC Temperature Compensation Value.*

## 66.2.52.2 Enumeration Type Documentation

### 66.2.52.2.1 enum clock\_wdog\_src\_t

Enumerator

- kClockWdogSrcLpoClk* LPO.
- kClockWdogSrcAltClk* Alternative clock, for K64F12 it is Bus clock.
- kClockWdogSrcLpoClk* LPO.
- kClockWdogSrcAltClk* Alternative clock, for K64F12 it is Bus clock.
- kClockWdogSrcLpoClk* LPO.
- kClockWdogSrcAltClk* Alternative clock, for K64F12 it is Bus clock.
- kClockWdogSrcLpoClk* LPO.
- kClockWdogSrcAltClk* Alternative clock, for K64F12 it is Bus clock.
- kClockWdogSrcLpoClk* LPO.
- kClockWdogSrcAltClk* Alternative clock, for K64F12 it is Bus clock.

### 66.2.52.2.2 enum clock\_afe\_src\_t

SIM\_MISC\_CTL[AFECLKSEL]

### 66.2.52.2.3 enum clock\_lptmr\_src\_t

Enumerator

- kClockLptmrSrcMcgIrClk* MCGIRCLK.
- kClockLptmrSrcLpoClk* LPO clock.
- kClockLptmrSrcEr32kClk* ERCLK32K clock.
- kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.
- kClockLptmrSrcMcgIrClk* MCGIRCLK.
- kClockLptmrSrcLpoClk* LPO clock.

## SIM HAL driver

*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.  
*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.  
*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.  
*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.

### 66.2.52.2.4 enum clock\_er32k\_src\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.  
*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.  
*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.  
*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.  
*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.52.3 Function Documentation

**66.2.52.3.1 static void SIM\_HAL\_EnableClock ( SIM\_Type \* *base*, sim\_clock\_gate\_name\_t *name* ) [inline], [static]**

This function enables the clock for specific module.

Parameters

---

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to enable.          |

**66.2.52.3.2** `static void SIM_HAL_DisableClock ( SIM_Type * base, sim_clock_gate_name_t name ) [inline], [static]`

This function disables the clock for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to disable.         |

**66.2.52.3.3** `static bool SIM_HAL_GetGateCmd ( SIM_Type * base, sim_clock_gate_name_t name ) [inline], [static]`

This function will get the clock gate state for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to get.             |

Returns

state true - ungated(Enabled), false - gated (Disabled)

**66.2.52.3.4** `static uint32_t SIM_HAL_GetSRamSize ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis system RAM size.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Kinetis System RAM Size

## SIM HAL driver

**66.2.52.3.5** `static void CLOCK_HAL_SetExternalRefClock32kSrc ( SIM_Type * base,  
clock_er32k_src_t setting ) [inline], [static]`

This function sets the clock selection of ERCLK32K.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.6** `static clock_er32k_src_t CLOCK_HAL_GetExternalRefClock32kSrc ( SIM_Type * base ) [inline], [static]`

This function gets the clock selection of ERCLK32K.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.7** `static void SIM_HAL_SetRamBitlinePrechargeCmd ( SIM_Type * base, bool enable ) [inline], [static]`

This function controls whether System SRAM bitline precharge is enabled during VLPR and VLPW modes.

Parameters

|               |                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                              |
| <i>enable</i> | RAM Bitline Precharge enable setting <ul style="list-style-type: none"> <li>• true: feature enabled.</li> <li>• false: feature disabled.</li> </ul> |

**66.2.52.3.8** `static bool SIM_HAL_GetRamBitlinePrechargeCmd ( SIM_Type * base ) [inline], [static]`

This function gets the RAM Bitline Precharge enable setting.

## SIM HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

True, if RAM Bitline Precharge is enabled.

**66.2.52.3.9 static void SIM\_HAL\_SetRamSrcBiasCmd ( SIM\_Type \* *base*, bool *disable* )  
[inline], [static]**

This function controls whether to DISABLE source bias of System SRAM arrays during VLPR and VL-PW modes.

### Parameters

|                |                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                                                                   |
| <i>disable</i> | source bias of SRAM arrays enable setting <ul style="list-style-type: none"> <li>• true: feature DISABLED.</li> <li>• false: feature ENABLED.</li> </ul> |

**66.2.52.3.10 static bool SIM\_HAL\_GetRamSrcBiasCmd ( SIM\_Type \* *base* ) [inline],  
[static]**

This function gets the source bias of SRAM arrays enable setting.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

1, if source bias of SRAM arrays is Disabled. 0, if source bias of SRAM arrays is Enabled.

**66.2.52.3.11 void SIM\_HAL\_SetLptmrChSelMode ( SIM\_Type \* *base*, uint8\_t *channel*,  
sim\_lptmr\_src\_sel\_t *select* )**

This function selects the LPTMR channel x source select setting.

## Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>channel</i> | LPTMR channel x                        |
| <i>select</i>  | LPTMR channel x source                 |

**66.2.52.3.12 `sim_lptmr_src_sel_t SIM_HAL_GetLptmrChSelMode ( SIM_Type * base, uint8_t channel )`**

This function gets the LPTMR channel x source select setting.

## Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>channel</i> | LPTMR channel x                        |

## Returns

select LPTMR channel x source select setting

**66.2.52.3.13 `static void CLOCK_HAL_SetClkOutSel ( SIM_Type * base, clock_clkout_src_t setting ) [inline], [static]`**

This function sets the selection of the clock to output on the CLKOUT pin.

## Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.14 `static clock_clkout_src_t CLOCK_HAL_GetClkOutSel ( SIM_Type * base ) [inline], [static]`**

This function gets the selection of the clock to output on the CLKOUT pin.

## Parameters

---

## SIM HAL driver

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.15** `static void CLOCK_HAL_SetSAdcTrgClkSel ( SIM_Type * base,  
sim_sadc_trg_clk_sel_t setting ) [inline], [static]`

This function selects the clock used to generate the ADC triggers.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.16** `static sim_sadc_trg_clk_sel_t CLOCK_HAL_GetSAdcTrgClkSel ( SIM_Type * base )  
[inline], [static]`

This function gets the selection of SAR ADC trigger clock.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.17** `static void CLOCK_HAL_SetTmrCntFreezeCmd ( SIM_Type * base,  
sim_tmr_cnt_freeze_sel_t setting ) [inline], [static]`

This function sets TMR counter freeze setting.

Parameters

---

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.18** `static sim_tmr_cnt_freeze_sel_t CLOCK_HAL_GetTmrCntFreezeCmd ( SIM_Type * base ) [inline], [static]`

This function gets the TMR counter freeze setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.19** `static void CLOCK_HAL_SetLpuartClkSel ( SIM_Type * base, clock_lpuart_src_t setting ) [inline], [static]`

This function selects the clock used for LPUART.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.20** `static clock_lpuart_src_t CLOCK_HAL_GetLpuartClkSel ( SIM_Type * base ) [inline], [static]`

This function gets the selection of LPUART clock.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

## SIM HAL driver

**66.2.52.3.21** `static void CLOCK_HAL_SetAfeOutDivCmd ( SIM_Type * base,  
sim_afe_clk_div_sel_t setting ) [inline], [static]`

This function controls whether AFE output clock is divided by AFE clock prescaler.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.22** `static sim_afe_clk_div_sel_t CLOCK_HAL_GetAfeOutDivCmd ( SIM_Type * base ) [inline], [static]`

This function gets the AFE output clock dividing setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.23** `static void CLOCK_HAL_SetXbarOutSel ( SIM_Type * base, clock_xbar_out_src_t setting ) [inline], [static]`

This function sets the selection of the clock to XBAR\_IN[5] pin.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.24** `static clock_xbar_out_src_t CLOCK_HAL_GetXbarOutSel ( SIM_Type * base ) [inline], [static]`

This function gets the selection of the clock to XBAR\_IN[5] pin.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## SIM HAL driver

Returns

Current selection.

**66.2.52.3.25** `static void CLOCK_HAL_SetPllflSel ( SIM_Type * base, clock_pllfl_sel_t setting ) [inline], [static]`

This function sets the selection of the high frequency clock for various peripheral clocking options

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.26** `static clock_pllfl_sel_t CLOCK_HAL_GetPllflSel ( SIM_Type * base ) [inline], [static]`

This function gets the selection of the high frequency clock for various peripheral clocking options

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.27** `void CLOCK_HAL_SetSpiOutInvCmd ( SIM_Type * base, uint32_t instance, uint8_t inv_type, sim_spi_out_invert_sel_t setting )`

This function sets SPI output signal inverting setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

|                 |                                                 |
|-----------------|-------------------------------------------------|
| <i>instance</i> | device instance                                 |
| <i>inv_type</i> | inverting type 3 - MISO 2 - MOSI 1 - SCK 0 - SS |
| <i>setting</i>  | The value to set.                               |

**66.2.52.3.28** `sim_spi_out_invert_sel_t` **CLOCK\_HAL\_GetSpiOutInvCmd** ( `SIM_Type * base`, `uint32_t instance`, `uint8_t inv_type` )

This function gets the SPI output signal inverting setting.

Parameters

|                 |                                                 |
|-----------------|-------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.          |
| <i>instance</i> | device instance                                 |
| <i>inv_type</i> | inverting type 3 - MISO 2 - MOSI 1 - SCK 0 - SS |

Returns

Current selection.

**66.2.52.3.29** `static void SIM_HAL_SetPllInVlpCmd` ( `SIM_Type * base`, `bool enable` ) [`inline`], [`static`]

This function controls whether to enable the PLL in VLP modes.

Parameters

|               |                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                           |
| <i>enable</i> | enable setting of PLL VLP feature <ul style="list-style-type: none"> <li>• true: feature enabled.</li> <li>• false: feature disabled.</li> </ul> |

**66.2.52.3.30** `static bool SIM_HAL_GetPllInVlpCmd` ( `SIM_Type * base` ) [`inline`], [`static`]

This function gets the PLL VLP enable setting.

## SIM HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

1, if PLL in VLP modes feature is enabled. 0, if PLL in VLP modes feature is disabled.

**66.2.52.331** `static void SIM_HAL_SetNmiDisCmd ( SIM_Type * base, bool disable ) [inline], [static]`

This function controls whether to disable the NMI feature.

### Parameters

|                |                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                                                       |
| <i>disable</i> | enable setting of NMI feature <ul style="list-style-type: none"> <li>• true: feature DISABLED.</li> <li>• false: feature ENABLED.</li> </ul> |

**66.2.52.332** `static bool SIM_HAL_GetNmiDisCmd ( SIM_Type * base ) [inline], [static]`

This function gets the NMI feature enable setting.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

1, if PLL in VLP modes feature is DISABLED. 0, if PLL in VLP modes feature is ENABLED.

**66.2.52.333** `static uint32_t SIM_HAL_GetFamilyId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Family ID in the System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Family ID

**66.2.52.3.34** `static uint32_t SIM_HAL_GetSubFamilyId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Sub-Family ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Sub-Family ID

**66.2.52.3.35** `static uint32_t SIM_HAL_GetSeriesId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Series ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Series ID

**66.2.52.3.36** `static uint32_t SIM_HAL_GetAttributeld ( SIM_Type * base ) [inline], [static]`

This function gets the Attribute ID in System Device ID register.

## SIM HAL driver

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Attribute ID

**66.2.52.3.37** `static uint32_t SIM_HAL_GetSRamSizeId ( SIM_Type * base ) [inline], [static]`

This function gets the SRAM SIZE in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id SRAM size

**66.2.52.3.38** `static uint32_t SIM_HAL_GetRevId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Revision ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Revision ID

**66.2.52.3.39** `static uint32_t SIM_HAL_GetDieId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Die ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Die ID

**66.2.52.3.40** `static uint32_t SIM_HAL_GetPinCntId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Pincount ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Pincount ID

**66.2.52.3.41** `static void CLOCK_HAL_SetSysDiv ( SIM_Type * base, uint8_t setting ) [inline], [static]`

This function sets divide value SYSDIV.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.42** `static uint8_t CLOCK_HAL_GetSysDiv ( SIM_Type * base ) [inline], [static]`

This function gets divide value SYSDIV.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## SIM HAL driver

Returns

Current divide value.

**66.2.52.3.43** `static void CLOCK_HAL_SetBusDiv ( SIM_Type * base, uint8_t setting )`  
`[inline], [static]`

This function sets BUS clock divider.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.44** `static uint8_t CLOCK_HAL_GetBusDiv ( SIM_Type * base )` `[inline], [static]`

This function gets BUS clock divider value.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.52.3.45** `static void CLOCK_HAL_SetFlashClkMode ( SIM_Type * base, uint8_t setting )`  
`[inline], [static]`

This function sets FLASH clock mode.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.46** `static uint8_t CLOCK_HAL_GetFlashClkMode ( SIM_Type * base ) [inline], [static]`

This function gets FLASH clock mode value.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.52.3.47** `void CLOCK_HAL_SetOutDiv ( SIM_Type * base, uint8_t sysDiv, uint8_t busDiv, uint8_t flashclkmode )`

This function sets all clock out dividers setting at one time.

Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <i>base</i>         | Base address for current SIM instance. |
| <i>sysDiv</i>       | system clock divider                   |
| <i>busDiv</i>       | bus clock divider                      |
| <i>flashclkmode</i> | flash clock mode setting               |

**66.2.52.3.48** `void CLOCK_HAL_GetOutDiv ( SIM_Type * base, uint8_t * sysDiv, uint8_t * busDiv, uint8_t * flashclkmode )`

This function gets all clock out dividers setting at one time

Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>sysDiv</i> | system clock divider                   |

## SIM HAL driver

|                     |                          |
|---------------------|--------------------------|
| <i>busDiv</i>       | bus clock divider        |
| <i>flashclkmode</i> | flash clock mode setting |

Returns

Current all divide values.

**66.2.52.3.49** `static uint32_t SIM_HAL_GetProgramFlashSize ( SIM_Type * base ) [inline], [static]`

This function gets the program flash size in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

size Program flash Size

**66.2.52.3.50** `static void SIM_HAL_SetFlashDoze ( SIM_Type * base, uint32_t setting ) [inline], [static]`

This function sets the Flash Doze in the Flash Configuration Register 1.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | Flash Doze setting                     |

**66.2.52.3.51** `static uint32_t SIM_HAL_GetFlashDoze ( SIM_Type * base ) [inline], [static]`

This function gets the Flash Doze in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting Flash Doze setting

**66.2.52.3.52 static void SIM\_HAL\_SetFlashDisableCmd ( SIM\_Type \* *base*, bool *disable* ) [inline], [static]**

This function sets the Flash disable setting in the Flash Configuration Register 1.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>disable</i> | Flash disable setting                  |

**66.2.52.3.53 static bool SIM\_HAL\_GetRamSize ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the RAM size

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

RAM size

**66.2.52.3.54 static bool SIM\_HAL\_GetFlashDisableCmd ( SIM\_Type \* *base* ) [inline], [static]**

This function gets the Flash disable setting in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## SIM HAL driver

Returns

setting Flash disable setting

**66.2.52.3.55** `static uint32_t SIM_HAL_GetFlashMaxAddrBlock0 ( SIM_Type * base ) [inline], [static]`

This function gets the Flash maximum block in Flash Configuration Register 2.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

address Flash maximum block address

**66.2.52.3.56** `static void SIM_HAL_SetVrefBuffPowerDownCmd ( SIM_Type * base, bool enable ) [inline], [static]`

This function controls whether to enable the VrefBuffer power down feature.

Parameters

|               |                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                 |
| <i>enable</i> | enable setting of VrefBuffer Power Down feature <ul style="list-style-type: none"> <li>• true: power down VrefBuffer.</li> <li>• false: VrefBuffer enabled.</li> </ul> |

**66.2.52.3.57** `static bool SIM_HAL_GetVrefBuffPowerDownCmd ( SIM_Type * base ) [inline], [static]`

This function gets the VrefBuffer enable setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

1, if VrefBuffer is powered down. 0, if VrefBuffer is enabled.

**66.2.52.3.58** `static void CLOCK_HAL_SetVrefBuffInputSel ( SIM_Type * base,  
sim_vref_buff_input_sel_t setting ) [inline], [static]`

This function selects the VrefBuffer input selection.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.59** `static sim_vref_buff_input_sel_t CLOCK_HAL_GetVrefBuffInputSel ( SIM_Type *  
base ) [inline], [static]`

This function gets the selection of VrefBuffer input.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.60** `static void SIM_HAL_SetVrefBuffOutCmd ( SIM_Type * base, bool enable )  
[inline], [static]`

This function controls whether to enable the VrefBuffer to drive PAD.

Parameters

---

## SIM HAL driver

|               |                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                             |
| <i>enable</i> | enable setting of VrefBuffer output drive feature <ul style="list-style-type: none"> <li>• true: VrefBuffer drives selected voltage on pad.</li> <li>• false: VrefBuffer not drive PAD.</li> </ul> |

**66.2.52.3.61** `static bool SIM_HAL_GetVrefBuffOutCmd ( SIM_Type * base ) [inline], [static]`

This function gets the VrefBuffer Output enable setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

1, if VrefBuffer output drive feature is enabled. 0, if VrefBuffer output drive feature is disabled.

**66.2.52.3.62** `static void CLOCK_HAL_SetRtcClkSel ( SIM_Type * base, clock_rtcout_src_t setting ) [inline], [static]`

This function selects the clock source for RTC operation.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.52.3.63** `static clock_rtcout_src_t CLOCK_HAL_GetRtcClkSel ( SIM_Type * base ) [inline], [static]`

This function gets the selection of RTC clock source.

Parameters

---

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.52.3.64** void SIM\_HAL\_SetTmrPrimaryCntSrcSelMode ( SIM\_Type \* *base*, uint8\_t *channel*, sim\_tmr\_Primary\_src\_sel\_t *select* )

This function selects the Quadtimer channel x Primary Count source.

Parameters

|                |                                          |
|----------------|------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.   |
| <i>channel</i> | Quadtimer channel x                      |
| <i>select</i>  | Quadtimer channel x primary count source |

**66.2.52.3.65** sim\_tmr\_Primary\_src\_sel\_t SIM\_HAL\_GetTmrPrimaryCntSrcSelMode ( SIM\_Type \* *base*, uint8\_t *channel* )

This function gets the Quadtimer channel x Primary Count source select setting.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>channel</i> | Quadtimer channel x                    |

Returns

select Quadtimer channel x primary count source select setting

**66.2.52.3.66** void SIM\_HAL\_SetTmrSecondCntSrcSelMode ( SIM\_Type \* *base*, uint8\_t *channel*, sim\_tmr\_sencond\_src\_sel\_t *select* )

This function selects the Quadtimer channel x Secondary Count source.

## SIM HAL driver

Parameters

|                |                                            |
|----------------|--------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.     |
| <i>channel</i> | Quadtimer channel x                        |
| <i>select</i>  | Quadtimer channel x Secondary count source |

**66.2.52.3.67** `sim_tmr_sencond_src_sel_t SIM_HAL_GetTmrSecondCntSrcSelMode ( SIM_Type * base, uint8_t channel )`

This function gets the Quadtimer channel x Secondary Count source select setting.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>channel</i> | Quadtimer channel x                    |

Returns

select Quadtimer channel x Secondary count source select setting

**66.2.52.3.68** `static void SIM_HAL_SetTmr0PllClkSelMode ( SIM_Type * base, clock_tmr0_pll_src_t select ) [inline], [static]`

This function selects the Timer0 CH0 PLL clock source.

Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>select</i> | Timer0 CH0 PLL clock source selection  |

**66.2.52.3.69** `static clock_tmr0_pll_src_t SIM_HAL_GetTmr0PllClkSelMode ( SIM_Type * base ) [inline], [static]`

This function gets the Timer0 CH0 PLL clock source select setting.

Parameters

---

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

select Timer0 CH0 PLL clock source selection.

**66.2.52.3.70** `static void SIM_HAL_SetEwmInputSelMode ( SIM_Type * base,  
sim_ewm_input_sel_t select ) [inline], [static]`

This function selects the External Watchdog Monitor Input source.

Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>select</i> | EWM input source selection             |

**66.2.52.3.71** `static sim_ewm_input_sel_t SIM_HAL_GetEwmInputSelMode ( SIM_Type * base )  
[inline], [static]`

This function gets the EWM input select setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

select EWM input source selection.

**66.2.52.3.72** `void SIM_HAL_SetUartIrdaSelMode ( SIM_Type * base, uint32_t instance,  
sim_uart_irda_sel_t select )`

This function sets the UART x IRDA select setting.

Parameters

## SIM HAL driver

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | Device instance.                       |
| <i>select</i>   | UART x IRDA selection.                 |

### 66.2.52.3.73 `sim_uart_irda_sel_t SIM_HAL_GetUartIrdSelMode ( SIM_Type * base, uint32_t instance )`

This function gets the UART x IRDA select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | Device instance.                       |

Returns

select UART x IRDA selection.

### 66.2.52.3.74 `static void SIM_HAL_SetUartModTypeSelMode ( SIM_Type * base, sim_uart_irda_type_sel_t select ) [inline], [static]`

This function selects the modulation type for IRDA support.

Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>select</i> | UART modulation type selection.        |

### 66.2.52.3.75 `static sim_uart_irda_type_sel_t SIM_HAL_GetUartModTypeSelMode ( SIM_Type * base ) [inline], [static]`

This function gets the UART modulation select setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

select UART modulation selection.

**66.2.52.3.76** `static void SIM_HAL_SetAfeClkPadDirCmd ( SIM_Type * base,  
sim_afe_clk_pad_dir_t setting ) [inline], [static]`

This function controls the direction of the AFE CLK pin.

Parameters

|                |                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                              |
| <i>setting</i> | AFE clock Pad direction setting <ul style="list-style-type: none"> <li>• 0: input.</li> <li>• 1: output.</li> </ul> |

**66.2.52.3.77** `static sim_afe_clk_pad_dir_t SIM_HAL_GetAfeClkPadDirCmd ( SIM_Type * base )  
[inline], [static]`

This function gets the AFE clock Pad direction setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting AFE clock Pad direction setting.

**66.2.52.3.78** `static void CLOCK_HAL_SetAfeClkSrc ( SIM_Type * base, clock_afe_src_t select )  
[inline], [static]`

This function sets the clock selection of AFECLKSEL.

## SIM HAL driver

### Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>select</i> | The clock source to select.            |

**66.2.52.3.79** `static clock_afe_src_t CLOCK_HAL_GetAfeClkSrc ( SIM_Type * base ) [inline], [static]`

This function gets the clock source selection of AFECLKSEL.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

Current selection.

**66.2.52.3.80** `static void SIM_HAL_SetDmaDoneSelMode ( SIM_Type * base, sim_dma_done_sel_t select ) [inline], [static]`

This function selects the DMA Done flag to drive XBAR\_IN[32].

### Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>select</i> | DMA Done selection.                    |

**66.2.52.3.81** `static sim_dma_done_sel_t SIM_HAL_GetDmaDoneSelMode ( SIM_Type * base ) [inline], [static]`

This function gets the DMA Done select setting.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current DMA Done selection.

**66.2.52.3.82** `static void SIM_HAL_SetAdcTrgSelMode ( SIM_Type * base, sim_adc_trg_src_sel_t select ) [inline], [static]`

This function controls whether PDB can trigger ADC directly.

Parameters

|               |                                        |
|---------------|----------------------------------------|
| <i>base</i>   | Base address for current SIM instance. |
| <i>select</i> | ADC trigger selection.                 |

**66.2.52.3.83** `static sim_adc_trg_src_sel_t SIM_HAL_GetAdcTrgSelMode ( SIM_Type * base ) [inline], [static]`

This function gets the ADC trigger source setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current ADC trigger selection.

**66.2.52.3.84** `static bool SIM_HAL_GetRtcOscStatusCmd ( SIM_Type * base ) [inline], [static]`

This function gets the status of RTC oscillator.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## SIM HAL driver

Returns

1, if RTC oscillator is enabled. 0, if RTC oscillator is disabled.

**66.2.52.3.85** `uint16_t SIM_HAL_GetAdcCompensationValueCmd ( SIM_Type * base, uint8_t temperature )`

This function gets the status of RTC oscillator.

Parameters

|                    |                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------|
| <i>base</i>        | Base address for current SIM instance.                                                          |
| <i>temperature</i> | under which temperature 0 - +25 degrees Celsius 1 - -40 degrees Celsius 2 - +85 degrees Celsius |

Returns

Compensation value

## 66.2.53 KV10Z7 SIM HAL driver

### 66.2.53.1 Overview

The section describes the enumerations, macros and data structures for KV10Z7 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKV10Z7.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_kv10z7\\_t](#) {  
  [kClockWdogSrcLpoClk](#),  
  [kClockWdogSrcAltClk](#) }  
*WDOG clock source select.*
- enum [clock\\_lptmr\\_src\\_kv10z7\\_t](#) {  
  [kClockLptmrSrcMcgIrClk](#),  
  [kClockLptmrSrcLpoClk](#),  
  [kClockLptmrSrcEr32kClk](#),  
  [kClockLptmrSrcOsc0erClk](#) }  
*LPTMR clock source select.*
- enum [clock\\_er32k\\_src\\_kv10z7\\_t](#) {  
  [kClockEr32kSrcOsc0](#) = 0U,

66.2.53.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.53.3 Enumeration Type Documentation

66.2.53.3.1 enum `clock_wdog_src_kv10z7_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.  
*kClockWdogSrcAltClk* Alternative clock.

66.2.53.3.2 enum `clock_lptmr_src_kv10z7_t`

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

66.2.53.3.3 enum `clock_er32k_src_kv10z7_t`

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.

## SIM HAL driver

### 66.2.53.3.4 enum clock\_clkout\_src\_kv10z7\_t

Enumerator

- kClockClkoutSelBusClk* Bus clock.
- kClockClkoutSelLpoClk* LPO clock.
- kClockClkoutSelMcgIrClk* MCG IRC clock.
- kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.53.3.5 enum sim\_adc\_pretrg\_sel\_kv10z7\_t

Enumerator

- kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.
- kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.53.3.6 enum sim\_adc\_trg\_sel\_kv10z7\_t

Enumerator

- kSimAdcTrgSelExt* External trigger.
- kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.
- kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.
- kSimAdcTrgSelDma0* DMA channel 0.
- kSimAdcTrgSelDma1* DMA channel 1.
- kSimAdcTrgSelDma2* DMA channel 2.
- kSimAdcTrgSelDma3* DMA channel 3.
- kSimAdcTrgSelFtm0* FTM0 trigger.
- kSimAdcTrgSelFtm1* FTM1 trigger.
- kSimAdcTrgSelFtm2* FTM2 trigger.
- kSimAdcTrgSelLptimer* Low-power timer trigger.

### 66.2.53.3.7 enum sim\_uart\_rxsrc\_kv10z7\_t

Enumerator

- kSimUartRxsrcPin* UARTx\_RX Pin.
- kSimUartRxsrcCmp0* CMP0.
- kSimUartRxsrcCmp1* CMP1.

### 66.2.53.3.8 enum sim\_uart\_txsrc\_kv10z7\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.

*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.

*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.53.3.9 enum sim\_ftm\_trg\_src\_kv10z7\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.

*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.53.3.10 enum sim\_ftm\_clk\_sel\_kv10z7\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.

*kSimFtmClkSel1* FTM CLKIN1 pin.

*kSimFtmClkSel2* FTM CLKIN2 pin.

### 66.2.53.3.11 enum clock\_ftm\_fixedfreq\_src\_kv10z7\_t

Enumerator

*kClockFtmClkMcgFfClk* MCGFFCLK.

*kClockFtmClkMcgIrClk* MCGIRCLK.

*kClockFtmClkOsc0erClk* OSCERCLK.

### 66.2.53.3.12 enum clock\_adc\_alt\_src\_kv10z7\_t

Enumerator

*kClockAdcAltClkSrcOutdiv5* OUTDIV5 output clock.

*kClockAdcAltClkSrcMcgIrClk* MCGIRCLK.

*kClockAdcAltClkSrcOsc0erClk* OSCERCLK.

## SIM HAL driver

### 66.2.53.3.13 enum sim\_ftm\_ch\_src\_kv10z7\_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y uses input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y uses input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y uses input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y uses input capture source 3.

### 66.2.53.3.14 enum sim\_ftm\_ch\_out\_src\_kv10z7\_t

Enumerator

- kSimFtmChOutSrc0* FlexTimer x channel y output source 0.
- kSimFtmChOutSrc1* FlexTimer x channel y output source 1.

### 66.2.53.3.15 enum sim\_ftmflt\_sel\_kv10z7\_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

### 66.2.53.3.16 enum sim\_ftmflt\_carrier\_sel\_kv10z7\_t

Enumerator

- kSimFtmCarrierSel0* Carrier frequency selection 0.
- kSimFtmCarrierSel1* Carrier frequency selection 1.

### 66.2.53.3.17 enum sim\_clock\_gate\_name\_kv10z7\_t

### 66.2.55.2 Macro Definition Documentation

66.2.55.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.55.3 Enumeration Type Documentation

66.2.55.3.1 enum `clock_wdog_src_kv11z7_t`

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock.

### 66.2.55.3.2 enum clock\_lptmr\_src\_kv11z7\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.55.3.3 enum clock\_er32k\_src\_kv11z7\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.55.3.4 enum clock\_clkout\_src\_kv11z7\_t

Enumerator

*kClockClkoutSelBusClk* Bus clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG IRC clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.55.3.5 enum sim\_adc\_altrg\_sel\_kv11z7\_t

Enumerator

*kSimAdcAltTrgselPDB0* PDB0 channel 0.  
*kSimAdcAltTrgselPDB1* PDB1 channel 0.  
*kSimAdcAltTrgselALT* Alternative trigger.  
*kSimAdcAltTrgselPDB0orPDB1* PDB0 or PDB1 channel 0.

### 66.2.55.3.6 enum sim\_adc\_pretrg\_sel\_kv11z7\_t

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

## SIM HAL driver

### 66.2.55.3.7 enum sim\_adc\_trg\_sel\_kv11z7\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgselExt0* External trigger 0.  
*kSimAdcTrgselHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgselHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgselExt1* External trigger 1.  
*kSimAdcTrgselDma0* DMA channel 0.  
*kSimAdcTrgselDma1* DMA channel 1.  
*kSimAdcTrgselDma2* DMA channel 2.  
*kSimAdcTrgselDma3* DMA channel 3.  
*kSimAdcTrgselFtm0* FTM0 trigger.  
*kSimAdcTrgselFtm1* FTM1 trigger.  
*kSimAdcTrgselFtm2* FTM2 trigger.  
*kSimAdcTrgselFtm3* FTM3 trigger.  
*kSimAdcTrgselFtm4* FTM4 trigger.  
*kSimAdcTrgselFtm5* FTM5 trigger.  
*kSimAdcTrgselLptimer* Low-power timer trigger.

### 66.2.55.3.8 enum sim\_uart\_rxsrc\_kv11z7\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

### 66.2.55.3.9 enum sim\_uart\_txsrc\_kv11z7\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.55.3.10 enum sim\_ftm\_trg\_src\_kv11z7\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

**66.2.55.3.11 enum sim\_ftm\_clk\_sel\_kv11z7\_t**

Enumerator

- kSimFtmClkSel0* FTM CLKIN0 pin.
- kSimFtmClkSel1* FTM CLKIN1 pin.
- kSimFtmClkSel2* FTM CLKIN2 pin.

**66.2.55.3.12 enum clock\_ftm\_fixedfreq\_src\_kv11z7\_t**

Enumerator

- kClockFtmClkMcgFfClk* MCGFFCLK.
- kClockFtmClkMcgIrClk* MCGIRCLK.
- kClockFtmClkOsc0erClk* OSCERCLK.

**66.2.55.3.13 enum clock\_adc\_alt\_src\_kv11z7\_t**

Enumerator

- kClockAdcAltClkSrcOutdiv5* OUTDIV5 output clock.
- kClockAdcAltClkSrcMcgIrClk* MCGIRCLK.
- kClockAdcAltClkSrcOsc0erClk* OSCERCLK.

**66.2.55.3.14 enum sim\_ftm\_ch\_src\_kv11z7\_t**

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y uses input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y uses input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y uses input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y uses input capture source 3.

**66.2.55.3.15 enum sim\_ftm\_ch\_out\_src\_kv11z7\_t**

Enumerator

- kSimFtmChOutSrc0* FlexTimer x channel y output source 0.
- kSimFtmChOutSrc1* FlexTimer x channel y output source 1.

## SIM HAL driver

### 66.2.55.3.16 enum sim\_ftm\_ft\_sel\_kv11z7\_t

Enumerator

*kSimFtmFtSel0* FlexTimer x fault y select 0.

*kSimFtmFtSel1* FlexTimer x fault y select 1.

### 66.2.55.3.17 enum sim\_ftm\_ft\_carrier\_sel\_kv11z7\_t

Enumerator

*kSimFtmCarrierSel0* Carrier frequency selection 0.

*kSimFtmCarrierSel1* Carrier frequency selection 1.

*kSimFtmCarrierSel2* Carrier frequency selection 2.

### 66.2.55.3.18 enum clock\_flexcan\_src\_kv11z7\_t

Enumerator

*kClockFlexcanSrcOsc0erClk* OSCERCLK.

*kClockFlexcanSrcBusClk* Bus clock.

### 66.2.55.3.19 enum sim\_clock\_gate\_name\_kv11z7\_t

## 66.2.56 KV30F12810 SIM HAL driver

### 66.2.56.1 Overview

The section describes the enumerations, macros and data structures for KV30F12810 SIM HAL driver.

*Sets the UARTx transmit data source select setting.*
- [sim\\_uart\\_txsrc\\_t SIM\\_HAL\\_GetUartTxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)  
*Gets the UARTx transmit data source select setting.*
- static void [SIM\\_HAL\\_SetLpuartRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_lpuart\\_rxsrc\\_t](#) select)  
*Sets the LPUARTx receive data source select setting.*
- static [sim\\_lpuart\\_rxsrc\\_t SIM\\_HAL\\_GetLpuartRxSrcMode](#) (SIM\_Type \*base, uint32\_t instance)  
*Gets the LPUARTx receive data source select setting.*
- void [SIM\\_HAL\\_SetFtmTriggerSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t trigger, [sim\\_ftm\\_trg\\_src\\_t](#) select)  
*Sets the FlexTimer x hardware trigger y source select setting.*
- [sim\\_ftm\\_trg\\_src\\_t SIM\\_HAL\\_GetFtmTriggerSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t trigger)  
*Gets the FlexTimer x hardware trigger y source select setting.*
- void [SIM\\_HAL\\_SetFtmExternalClkPinMode](#) (SIM\_Type \*base, uint32\_t instance, [sim\\_ftm\\_clk\\_sel\\_t](#) select)  
*Sets the FlexTimer x external clock pin select setting.*
- [sim\\_ftm\\_clk\\_sel\\_t SIM\\_HAL\\_GetFtmExternalClkPinMode](#) (SIM\_Type \*base, uint32\_t instance)  
*Gets the FlexTimer x external clock pin select setting.*
- void [SIM\\_HAL\\_SetFtmChSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t channel, [sim\\_ftm\\_ch\\_src\\_t](#) select)  
*Sets the FlexTimer x channel y input capture source select setting.*
- [sim\\_ftm\\_ch\\_src\\_t SIM\\_HAL\\_GetFtmChSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t channel)  
*Gets the FlexTimer x channel y input capture source select setting.*
- void [SIM\\_HAL\\_SetFtmChOutSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t channel, [sim\\_ftm\\_ch\\_out\\_src\\_t](#) select)  
*Sets the FlexTimer x channel y output source select setting.*
- [sim\\_ftm\\_ch\\_out\\_src\\_t SIM\\_HAL\\_GetFtmChOutSrcMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t channel)  
*Gets the FlexTimer x channel y output source select setting.*
- void [SIM\\_HAL\\_SetFtmSyncCmd](#) (SIM\_Type \*base, uint32\_t instance, bool sync)

## SIM HAL driver

- Set FlexTimer x hardware trigger 0 software synchronization.*

  - static bool [SIM\\_HAL\\_GetFtmSyncCmd](#) (SIM\_Type \*base, uint32\_t instance)
- Get FlexTimer x hardware trigger 0 software synchronization setting.*

  - void [SIM\\_HAL\\_SetFtmFaultSelMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t fault, [sim\\_ftm\\_ft\\_sel\\_t](#) select)
- Sets the FlexTimer x fault y select setting.*

  - [sim\\_ftm\\_ft\\_sel\\_t SIM\\_HAL\\_GetFtmFaultSelMode](#) (SIM\_Type \*base, uint32\_t instance, uint8\_t fault)
- Gets the FlexTimer x fault y select setting.*

  - static uint32\_t [SIM\\_HAL\\_GetFamilyId](#) (SIM\_Type \*base)
- Gets the Kinetis Family ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t [SIM\\_HAL\\_GetSubFamilyId](#) (SIM\_Type \*base)
- Gets the Kinetis Sub-Family ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t [SIM\\_HAL\\_GetSeriesId](#) (SIM\_Type \*base)
- Gets the Kinetis SeriesID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t [SIM\\_HAL\\_GetPinCntId](#) (SIM\_Type \*base)
- Gets the Kinetis Pincount ID in System Device ID register (SIM\_SDID).*

  - static uint32\_t [SIM\\_HAL\\_GetRevId](#) (SIM\_Type \*base)
- Gets the Kinetis Revision ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t [SIM\\_HAL\\_GetDieId](#) (SIM\_Type \*base)
- Gets the Kinetis Die ID in the System Device ID register (SIM\_SDID).*

  - static uint32\_t [SIM\\_HAL\\_GetProgramFlashSize](#) (SIM\_Type \*base)
- Gets the program flash size in the Flash Configuration Register 1 (SIM\_FCFG).*

  - static void [SIM\\_HAL\\_SetFlashDoze](#) (SIM\_Type \*base, uint32\_t setting)
- Sets the Flash Doze in the Flash Configuration Register 1 (SIM\_FCFG).*

  - static uint32\_t [SIM\\_HAL\\_GetFlashDoze](#) (SIM\_Type \*base)
- Gets the Flash Doze in the Flash Configuration Register 1 (SIM\_FCFG).*

  - static void [SIM\\_HAL\\_SetFlashDisableCmd](#) (SIM\_Type \*base, bool disable)
- Sets the Flash disable setting.*

  - static bool [SIM\\_HAL\\_GetFlashDisableCmd](#) (SIM\_Type \*base)
- Gets the Flash disable setting.*

  - static uint32\_t [SIM\\_HAL\\_GetFlashMaxAddrBlock0](#) (SIM\_Type \*base)
- Gets the Flash maximum address block 0 in the Flash Configuration Register 1 (SIM\_FCFG).*

  - static uint32\_t [SIM\\_HAL\\_GetFlashMaxAddrBlock1](#) (SIM\_Type \*base)
- Gets the Flash maximum address block 1 in Flash Configuration Register 2.*

### 66.2.59.2 Macro Definition Documentation

66.2.59.2.1 #define FSL\_SIM\_SCGC\_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)

### 66.2.59.3 Enumeration Type Documentation

66.2.59.3.1 enum clock\_wdog\_src\_kv31f51212\_t

Enumerator

*kClockWdogSrcLpoClk* LPO.

*kClockWdogSrcAltClk* Alternative clock, for this SOC it is Bus clock.

### 66.2.59.3.2 enum clock\_trace\_src\_kv31f51212\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.  
*kClockTraceSrcCoreClk* core clock

### 66.2.59.3.3 enum clock\_port\_filter\_src\_kv31f51212\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.  
*kClockPortFilterSrcLpoClk* LPO.

### 66.2.59.3.4 enum clock\_lptmr\_src\_kv31f51212\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCGIRCLK.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClkUndiv* OSCERCLK\_UNDIV clock.

### 66.2.59.3.5 enum clock\_lpuart\_src\_kv31f51212\_t

Enumerator

*kClockLpuartSrcNone* Clock disabled.  
*kClockLpuartSrcPllFllSel* Clock as selected by SOPT2[PLLFLSEL].  
*kClockLpuartSrcOsc0erClk* OSCERCLK.  
*kClockLpuartSrcMcgIrClk* MCGIRCLK.

### 66.2.59.3.6 enum clock\_pllfl\_sel\_kv31f51212\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.  
*kClockPllFllSelIrc48M* IRC48MCLK.

## SIM HAL driver

### 66.2.59.3.7 enum clock\_er32k\_src\_kv31f51212\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.59.3.8 enum clock\_clkout\_src\_kv31f51212\_t

Enumerator

*kClockClkoutSelFlexbusClk* Flexbus clock.  
*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCGIRCLK.  
*kClockClkoutSelOsc0erClk* OSC0ERCLK.  
*kClockClkoutSelIrc48M* IRC48MCLK.

### 66.2.59.3.9 enum sim\_adc\_pretrg\_sel\_kv31f51212\_t

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

### 66.2.59.3.10 enum sim\_adc\_trg\_sel\_kv31f51212\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.  
*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelPit2* PIT trigger 2.  
*kSimAdcTrgSelPit3* PIT trigger 3.  
*kSimAdcTrgSelFtm0* FTM0 trigger.  
*kSimAdcTrgSelFtm1* FTM1 trigger.  
*kSimAdcTrgSelFtm2* FTM2 trigger.  
*kSimAdcTrgSelFtm3* FTM3 trigger.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.

**66.2.59.3.11 enum sim\_lpuart\_rxsrc\_kv31f51212\_t**

Enumerator

*kSimLpuartRxsrcPin* LPUARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.  
*kSimLpuartRxsrcCmp1* CMP1.

**66.2.59.3.12 enum sim\_uart\_rxsrc\_kv31f51212\_t**

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.  
*kSimUartRxsrcCmp1* CMP1.

**66.2.59.3.13 enum sim\_uart\_txsrc\_kv31f51212\_t**

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.  
*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

**66.2.59.3.14 enum sim\_ftm\_trg\_src\_kv31f51212\_t**

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.  
*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

**66.2.59.3.15 enum sim\_ftm\_clk\_sel\_kv31f51212\_t**

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.  
*kSimFtmClkSel1* FTM CLKIN1 pin.

## SIM HAL driver

### 66.2.59.3.16 enum sim\_ftm\_ch\_src\_kv31f51212\_t

Enumerator

- kSimFtmChSrc0* FlexTimer x channel y input capture source 0.
- kSimFtmChSrc1* FlexTimer x channel y input capture source 1.
- kSimFtmChSrc2* FlexTimer x channel y input capture source 2.
- kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.59.3.17 enum sim\_ftm\_ch\_out\_src\_kv31f51212\_t

Enumerator

- kSimFtmChOutSrc0* FlexTimer x channel y output source 0.
- kSimFtmChOutSrc1* FlexTimer x channel y output source 1.

### 66.2.59.3.18 enum sim\_ftmflt\_sel\_kv31f51212\_t

Enumerator

- kSimFtmFltSel0* FlexTimer x fault y select 0.
- kSimFtmFltSel1* FlexTimer x fault y select 1.

### 66.2.59.3.19 enum sim\_flexbus\_security\_level\_kv31f51212\_t

Enumerator

- kSimFbslLevel0* FlexBus security level 0.
- kSimFbslLevel1* FlexBus security level 1.
- kSimFbslLevel2* FlexBus security level 2.
- kSimFbslLevel3* FlexBus security level 3.

### 66.2.59.3.20 enum sim\_clock\_gate\_name\_kv31f51212\_t

## 66.2.59.4 Function Documentation

**66.2.59.4.1 static void SIM\_HAL\_EnableClock ( SIM\_Type \* *base*, sim\_clock\_gate\_name\_t *name* ) [inline], [static]**

This function enables the clock for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to enable.          |

**66.2.59.4.2** `static void SIM_HAL_DisableClock ( SIM_Type * base, sim_clock_gate_name_t name ) [inline], [static]`

This function disables the clock for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to disable.         |

**66.2.59.4.3** `static bool SIM_HAL_GetGateCmd ( SIM_Type * base, sim_clock_gate_name_t name ) [inline], [static]`

This function will get the clock gate state for specific module.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
| <i>name</i> | Name of the module to get.             |

Returns

state true - ungated(Enabled), false - gated (Disabled)

**66.2.59.4.4** `static void CLOCK_HAL_SetLpuartSrc ( SIM_Type * base, uint32_t instance, clock_lpuart_src_t setting ) [inline], [static]`

This function sets lpuart clock source selection.

Parameters

---

## SIM HAL driver

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | LPUART instance.                       |
| <i>setting</i>  | The value to set.                      |

**66.2.59.4.5** `static clock_lpuart_src_t CLOCK_HAL_GetLpuartSrc ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets lpuart clock source selection.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | LPUART instance.                       |

Returns

Current selection.

**66.2.59.4.6** `static void CLOCK_HAL_SetTraceClkSrc ( SIM_Type * base, clock_trace_src_t setting ) [inline], [static]`

This function sets debug trace clock selection.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.59.4.7** `static clock_trace_src_t CLOCK_HAL_GetTraceClkSrc ( SIM_Type * base ) [inline], [static]`

This function gets debug trace clock selection.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.59.4.8** `static void CLOCK_HAL_SetExternalRefClock32kSrc ( SIM_Type * base, clock_er32k_src_t setting ) [inline], [static]`

This function sets the clock selection of ERCLK32K.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.59.4.9** `static clock_er32k_src_t CLOCK_HAL_GetExternalRefClock32kSrc ( SIM_Type * base ) [inline], [static]`

This function gets the clock selection of ERCLK32K.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.59.4.10** `static void CLOCK_HAL_SetPllfllSel ( SIM_Type * base, clock_pllfl_sel_t setting ) [inline], [static]`

This function sets the selection of the high frequency clock for various peripheral clocking options

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## SIM HAL driver

|                |                   |
|----------------|-------------------|
| <i>setting</i> | The value to set. |
|----------------|-------------------|

**66.2.59.4.11** `static clock_pllfl_sel_t CLOCK_HAL_GetPlIflSel ( SIM_Type * base ) [inline], [static]`

This function gets the selection of the high frequency clock for various peripheral clocking options

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.59.4.12** `static void CLOCK_HAL_SetClkOutSel ( SIM_Type * base, clock_clkout_src_t setting ) [inline], [static]`

This function sets the selection of the clock to output on the CLKOUT pin.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.59.4.13** `static clock_clkout_src_t CLOCK_HAL_GetClkOutSel ( SIM_Type * base ) [inline], [static]`

This function gets the selection of the clock to output on the CLKOUT pin.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.59.4.14** `static void CLOCK_HAL_SetOsc32kOutSel ( SIM_Type * base, clock_osc32kout_sel_t setting ) [inline], [static]`

This function sets ERCLK32K output pin.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.59.4.15** `static clock_osc32kout_sel_t CLOCK_HAL_GetOsc32kOutSel ( SIM_Type * base ) [inline], [static]`

This function gets ERCLK32K output pin setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current selection.

**66.2.59.4.16** `static void CLOCK_HAL_SetOutDiv1 ( SIM_Type * base, uint8_t setting ) [inline], [static]`

This function sets divide value OUTDIV1.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.59.4.17** `static uint8_t CLOCK_HAL_GetOutDiv1 ( SIM_Type * base ) [inline], [static]`

This function gets divide value OUTDIV1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

## SIM HAL driver

Returns

Current divide value.

**66.2.59.4.18** `static void CLOCK_HAL_SetOutDiv2 ( SIM_Type * base, uint8_t setting )`  
`[inline], [static]`

This function sets divide value OUTDIV2.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.59.4.19** `static uint8_t CLOCK_HAL_GetOutDiv2 ( SIM_Type * base )` `[inline],`  
`[static]`

This function gets divide value OUTDIV2.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.59.4.20** `static void CLOCK_HAL_SetOutDiv3 ( SIM_Type * base, uint8_t setting )`  
`[inline], [static]`

This function sets divide value OUTDIV3.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

|                |                   |
|----------------|-------------------|
| <i>setting</i> | The value to set. |
|----------------|-------------------|

**66.2.59.4.21** `static uint8_t CLOCK_HAL_GetOutDiv3 ( SIM_Type * base ) [inline], [static]`

This function gets divide value OUTDIV3.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.59.4.22** `static void CLOCK_HAL_SetOutDiv4 ( SIM_Type * base, uint8_t setting ) [inline], [static]`

This function sets divide value OUTDIV4.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | The value to set.                      |

**66.2.59.4.23** `static uint8_t CLOCK_HAL_GetOutDiv4 ( SIM_Type * base ) [inline], [static]`

This function gets divide value OUTDIV4.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

Current divide value.

**66.2.59.4.24** `void CLOCK_HAL_SetOutDiv ( SIM_Type * base, uint8_t outdiv1, uint8_t outdiv2, uint8_t outdiv3, uint8_t outdiv4 )`

This function sets the setting for all clock out dividers at the same time.

## SIM HAL driver

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>outdiv1</i> | Outdivider1 setting                    |
| <i>outdiv2</i> | Outdivider2 setting                    |
| <i>outdiv3</i> | Outdivider3 setting                    |
| <i>outdiv4</i> | Outdivider4 setting                    |

**66.2.59.4.25** void **CLOCK\_HAL\_GetOutDiv** ( SIM\_Type \* *base*, uint8\_t \* *outdiv1*, uint8\_t \* *outdiv2*, uint8\_t \* *outdiv3*, uint8\_t \* *outdiv4* )

This function gets the setting for all clock out dividers at the same time.

Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>outdiv1</i> | Outdivider1 setting                    |
| <i>outdiv2</i> | Outdivider2 setting                    |
| <i>outdiv3</i> | Outdivider3 setting                    |
| <i>outdiv4</i> | Outdivider4 setting                    |

**66.2.59.4.26** static uint32\_t **SIM\_HAL\_GetRamSize** ( SIM\_Type \* *base* ) [inline], [static]

This function gets the RAM size. The field specifies the amount of system RAM available on the device.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

size RAM size on the device

**66.2.59.4.27** static void **SIM\_HAL\_SetFlexbusSecurityLevelMode** ( SIM\_Type \* *base*, sim\_flexbus\_security\_level\_t *setting* ) [inline], [static]

This function sets the FlexBus security level setting. If the security is enabled, this field affects which CPU operations can access the off-chip via the FlexBus and DDR controller interfaces. This field has no effect if the security is not enabled.

Parameters

|                |                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | Base address for current SIM instance.                                                                                                                                                                                                                                                                                                         |
| <i>setting</i> | FlexBus security level setting <ul style="list-style-type: none"> <li>• 00: All off-chip accesses (op code and data) via the FlexBus and DDR controller are disallowed.</li> <li>• 10: Off-chip op code accesses are disallowed. Data accesses are allowed.</li> <li>• 11: Off-chip op code accesses and data accesses are allowed.</li> </ul> |

**66.2.59.4.28** `static sim_flexbus_security_level_t SIM_HAL_GetFlexbusSecurityLevelMode ( SIM_Type * base ) [inline], [static]`

This function gets the FlexBus security level setting.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting FlexBus security level setting

**66.2.59.4.29** `void SIM_HAL_SetAdcAlternativeTriggerCmd ( SIM_Type * base, uint32_t instance, bool enable ) [inline]`

This function enables/disables the alternative conversion triggers for ADCx.

Parameters

|                 |                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                 |
| <i>instance</i> | device instance.                                                                                                                                                                       |
| <i>enable</i>   | Enable alternative conversion triggers for ADCx <ul style="list-style-type: none"> <li>• true: Select alternative conversion trigger.</li> <li>• false: Select PDB trigger.</li> </ul> |

## SIM HAL driver

Sets the USB voltage regulator enabled setting.

This function enables/disables the alternative conversion triggers for ADCx.

Parameters

|                 |                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                 |
| <i>instance</i> | device instance.                                                                                                                                                                       |
| <i>enable</i>   | Enable alternative conversion triggers for ADCx <ul style="list-style-type: none"> <li>• true: Select alternative conversion trigger.</li> <li>• false: Select PDB trigger.</li> </ul> |

This function controls whether the USB voltage regulator is enabled. This bit can only be written when the SOPT1CFG[URWE] bit is set.

Parameters

|               |                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | Base address for current SIM instance.                                                                                                                                                |
| <i>enable</i> | USB voltage regulator enable setting <ul style="list-style-type: none"> <li>• true: USB voltage regulator is enabled.</li> <li>• false: USB voltage regulator is disabled.</li> </ul> |

Sets the ADCx alternate trigger enable setting.

This function enables/disables the alternative conversion triggers for ADCx.

Parameters

|                 |                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                 |
| <i>instance</i> | device instance.                                                                                                                                                                       |
| <i>enable</i>   | Enable alternative conversion triggers for ADCx <ul style="list-style-type: none"> <li>• true: Select alternative conversion trigger.</li> <li>• false: Select PDB trigger.</li> </ul> |

**66.2.59.4.30** `bool SIM_HAL_GetAdcAlternativeTriggerCmd ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the ADCx alternate trigger enable setting.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

## Returns

enabled True if ADCx alternate trigger is enabled

**66.2.59.4.31** `void SIM_HAL_SetAdcPreTriggerMode ( SIM_Type * base, uint32_t instance, sim_adc_pretrg_sel_t select ) [inline]`

This function selects the ADCx pre-trigger source when the alternative triggers are enabled through ADCxALTTRGEN.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | pre-trigger select setting for ADCx    |

**66.2.59.4.32** `sim_adc_pretrg_sel_t SIM_HAL_GetAdcPreTriggerMode ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the ADCx pre-trigger select setting.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

## Returns

select ADCx pre-trigger select setting

**66.2.59.4.33** `void SIM_HAL_SetAdcTriggerMode ( SIM_Type * base, uint32_t instance, sim_adc_trg_sel_t select ) [inline]`

This function selects the ADCx trigger source when alternative triggers are enabled through ADCxALTTRGEN.

## SIM HAL driver

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | trigger select setting for ADCx        |

**66.2.59.4.34** `sim_adc_trg_sel_t SIM_HAL_GetAdcTriggerMode ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the ADCx trigger select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

ADCx trigger select setting

**66.2.59.4.35** `void SIM_HAL_SetAdcTriggerModeOneStep ( SIM_Type * base, uint32_t instance, bool altTrigEn, sim_adc_pretrg_sel_t preTrigSel, sim_adc_trg_sel_t trigSel )`

This function sets ADC alternate trigger, pre-trigger mode and trigger mode.

Parameters

|                   |                                        |
|-------------------|----------------------------------------|
| <i>base</i>       | Base address for current SIM instance. |
| <i>instance</i>   | device instance.                       |
| <i>altTrigEn</i>  | Alternative trigger enable or not.     |
| <i>preTrigSel</i> | Pre-trigger mode.                      |
| <i>trigSel</i>    | Trigger mode.                          |

**66.2.59.4.36** `void SIM_HAL_SetUartRxSrcMode ( SIM_Type * base, uint32_t instance, sim_uart_rxsrc_t select ) [inline]`

This function selects the source for the UARTx receive data.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | the source for the UARTx receive data  |

**66.2.59.4.37** `sim_uart_rxsrc_t SIM_HAL_GetUartRxSrcMode ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the UARTx receive data source select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

select UARTx receive data source select setting

**66.2.59.4.38** `void SIM_HAL_SetUartTxSrcMode ( SIM_Type * base, uint32_t instance, sim_uart_txsrc_t select ) [inline]`

This function selects the source for the UARTx transmit data.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>select</i>   | the source for the UARTx transmit data |

**66.2.59.4.39** `sim_uart_txsrc_t SIM_HAL_GetUartTxSrcMode ( SIM_Type * base, uint32_t instance ) [inline]`

This function gets the UARTx transmit data source select setting.

## SIM HAL driver

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

### Returns

select UARTx transmit data source select setting

**66.2.59.4.40** `static void SIM_HAL_SetLpuartRxSrcMode ( SIM_Type * base, uint32_t instance, sim_lpuart_rxsrc_t select ) [inline], [static]`

This function selects the source for the LPUARTx receive data.

### Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>base</i>     | Base address for current SIM instance.  |
| <i>instance</i> | device instance.                        |
| <i>select</i>   | the source for the LPUARTx receive data |

**66.2.59.4.41** `static sim_lpuart_rxsrc_t SIM_HAL_GetLpuartRxSrcMode ( SIM_Type * base, uint32_t instance ) [inline], [static]`

This function gets the LPUARTx receive data source select setting.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

### Returns

select LPUARTx receive data source select setting

**66.2.59.4.42** `void SIM_HAL_SetFtmTriggerSrcMode ( SIM_Type * base, uint32_t instance, uint8_t trigger, sim_ftm_trg_src_t select )`

This function selects the source of FTMx hardware trigger y.

## Parameters

|                 |                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                |
| <i>instance</i> | device instance.                                                                                                                                                      |
| <i>trigger</i>  | hardware trigger y                                                                                                                                                    |
| <i>select</i>   | FlexTimer x hardware trigger y <ul style="list-style-type: none"> <li>• 0: Pre-trigger A selected for ADCx.</li> <li>• 1: Pre-trigger B selected for ADCx.</li> </ul> |

**66.2.59.4.43** `sim_ftm_trg_src_t SIM_HAL_GetFtmTriggerSrcMode ( SIM_Type * base, uint32_t instance, uint8_t trigger )`

This function gets the FlexTimer x hardware trigger y source select setting.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>trigger</i>  | hardware trigger y                     |

## Returns

select FlexTimer x hardware trigger y source select setting

**66.2.59.4.44** `void SIM_HAL_SetFtmExternalClkPinMode ( SIM_Type * base, uint32_t instance, sim_ftm_clk_sel_t select )`

This function selects the source of FTMx external clock pin select.

## Parameters

|                 |                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                                                          |
| <i>instance</i> | device instance.                                                                                                                                                                                |
| <i>select</i>   | FTMx external clock pin select <ul style="list-style-type: none"> <li>• 0: FTMx external clock driven by FTM CLKIN0 pin.</li> <li>• 1: FTMx external clock driven by FTM CLKIN1 pin.</li> </ul> |

## SIM HAL driver

**66.2.59.4.45** `sim_ftm_clk_sel_t SIM_HAL_GetFtmExternalClkPinMode ( SIM_Type * base,  
uint32_t instance )`

This function gets the FlexTimer x external clock pin select setting.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

## Returns

select FlexTimer x external clock pin select setting

**66.2.59.4.46** void **SIM\_HAL\_SetFtmChSrcMode** ( **SIM\_Type \* base**, **uint32\_t instance**, **uint8\_t channel**, **sim\_ftm\_ch\_src\_t select** )

This function selects the FlexTimer x channel y input capture source.

## Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.     |
| <i>instance</i> | device instance.                           |
| <i>channel</i>  | FlexTimer channel y                        |
| <i>select</i>   | FlexTimer x channel y input capture source |

**66.2.59.4.47** **sim\_ftm\_ch\_src\_t** **SIM\_HAL\_GetFtmChSrcMode** ( **SIM\_Type \* base**, **uint32\_t instance**, **uint8\_t channel** )

This function gets the FlexTimer x channel y input capture source select setting.

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>channel</i>  | FlexTimer channel y                    |

## Returns

select FlexTimer x channel y input capture source select setting

**66.2.59.4.48** void **SIM\_HAL\_SetFtmChOutSrcMode** ( **SIM\_Type \* base**, **uint32\_t instance**, **uint8\_t channel**, **sim\_ftm\_ch\_out\_src\_t select** )

This function selects the FlexTimer x channel y output source.

## SIM HAL driver

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>channel</i>  | FlexTimer channel y                    |
| <i>select</i>   | FlexTimer x channel y output source    |

**66.2.59.4.49** `sim_ftm_ch_out_src_t SIM_HAL_GetFtmChOutSrcMode ( SIM_Type * base, uint32_t instance, uint8_t channel )`

This function gets the FlexTimer x channel y output source select setting.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>channel</i>  | FlexTimer channel y                    |

### Returns

select FlexTimer x channel y output source select setting

**66.2.59.4.50** `void SIM_HAL_SetFtmSyncCmd ( SIM_Type * base, uint32_t instance, bool sync )`

This function sets FlexTimer x hardware trigger 0 software synchronization. FTMxSYNCBIT.

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>sync</i>     | Synchronize or not.                    |

**66.2.59.4.51** `static bool SIM_HAL_GetFtmSyncCmd ( SIM_Type * base, uint32_t instance )  
[inline], [static]`

This function gets FlexTimer x hardware trigger 0 software synchronization. FTMxSYNCBIT.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |

Returns

The synchronization value.

**66.2.59.4.52** `void SIM_HAL_SetFtmFaultSelMode ( SIM_Type * base, uint32_t instance, uint8_t fault, sim_ftm_ft_sel_t select )`

This function sets the FlexTimer x fault y select setting.

Parameters

|                 |                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>     | Base address for current SIM instance.                                                                                                                              |
| <i>instance</i> | device instance.                                                                                                                                                    |
| <i>fault</i>    | fault y                                                                                                                                                             |
| <i>select</i>   | FlexTimer x fault y select setting <ul style="list-style-type: none"> <li>• 0: FlexTimer x fault y select 0.</li> <li>• 1: FlexTimer x fault y select 1.</li> </ul> |

**66.2.59.4.53** `sim_ftm_ft_sel_t SIM_HAL_GetFtmFaultSelMode ( SIM_Type * base, uint32_t instance, uint8_t fault )`

This function gets the FlexTimer x fault y select setting.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>base</i>     | Base address for current SIM instance. |
| <i>instance</i> | device instance.                       |
| <i>fault</i>    | fault y                                |

Returns

select FlexTimer x fault y select setting

**66.2.59.4.54** `static uint32_t SIM_HAL_GetFamilyId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Family ID in the System Device ID register.

## SIM HAL driver

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Family ID

**66.2.59.4.55** `static uint32_t SIM_HAL_GetSubFamilyId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Sub-Family ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Sub-Family ID

**66.2.59.4.56** `static uint32_t SIM_HAL_GetSeriesId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Series ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Series ID

**66.2.59.4.57** `static uint32_t SIM_HAL_GetPinCntId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Pincount ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Pincount ID

**66.2.59.4.58** `static uint32_t SIM_HAL_GetRevId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Revision ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Revision ID

**66.2.59.4.59** `static uint32_t SIM_HAL_GetDieId ( SIM_Type * base ) [inline], [static]`

This function gets the Kinetis Die ID in System Device ID register.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

id Kinetis Die ID

**66.2.59.4.60** `static uint32_t SIM_HAL_GetProgramFlashSize ( SIM_Type * base ) [inline], [static]`

This function gets the program flash size in the Flash Configuration Register 1.

## SIM HAL driver

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

size Program flash Size

**66.2.59.4.61** `static void SIM_HAL_SetFlashDoze ( SIM_Type * base, uint32_t setting )`  
**[inline], [static]**

This function sets the Flash Doze in the Flash Configuration Register 1.

### Parameters

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>setting</i> | Flash Doze setting                     |

**66.2.59.4.62** `static uint32_t SIM_HAL_GetFlashDoze ( SIM_Type * base )` **[inline],**  
**[static]**

This function gets the Flash Doze in the Flash Configuration Register 1.

### Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

setting Flash Doze setting

**66.2.59.4.63** `static void SIM_HAL_SetFlashDisableCmd ( SIM_Type * base, bool disable )`  
**[inline], [static]**

This function sets the Flash disable setting in the Flash Configuration Register 1.

### Parameters

---

|                |                                        |
|----------------|----------------------------------------|
| <i>base</i>    | Base address for current SIM instance. |
| <i>disable</i> | Flash disable setting                  |

**66.2.59.4.64** `static bool SIM_HAL_GetFlashDisableCmd ( SIM_Type * base ) [inline], [static]`

This function gets the Flash disable setting in the Flash Configuration Register 1.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

setting Flash disable setting

**66.2.59.4.65** `static uint32_t SIM_HAL_GetFlashMaxAddrBlock0 ( SIM_Type * base ) [inline], [static]`

This function gets the Flash maximum block 0 in Flash Configuration Register 2.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

Returns

address Flash maximum block 0 address

**66.2.59.4.66** `static uint32_t SIM_HAL_GetFlashMaxAddrBlock1 ( SIM_Type * base ) [inline], [static]`

This function gets the Flash maximum block 1 in Flash Configuration Register 1.

Parameters

---

## SIM HAL driver

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SIM instance. |
|-------------|----------------------------------------|

### Returns

address Flash maximum block 0 address

## 66.2.60 KW01Z4 SIM HAL driver

### 66.2.60.1 Overview

The section describes the enumerations, macros and data structures for KW01Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKW01Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kw01z4\\_t](#) {  
  [kClockCopSrcLpoClk](#),  
  [kClockCopSrcAltClk](#) }  
*COP clock source select.*

## 66.2.60.2 Macro Definition Documentation

66.2.60.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.60.3 Enumeration Type Documentation

66.2.60.3.1 enum `clock_cop_src_kw01z4_t`

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KW01Z4 it is Bus clock.

## SIM HAL driver

### 66.2.60.3.2 enum clock\_tpm\_src\_kw01z4\_t

Enumerator

*kClockTpmSrcNone* clock disabled  
*kClockTpmSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockTpmSrcOsc0erClk* OSCERCLK clock.  
*kClockTpmSrcMcgIrClk* MCGIR clock.

### 66.2.60.3.3 enum clock\_lptmr\_src\_kw01z4\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.  
*kClockLptmrSrcLpoClk* LPO clock.  
*kClockLptmrSrcEr32kClk* ERCLK32K clock.  
*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.60.3.4 enum clock\_lpsci\_src\_kw01z4\_t

Enumerator

*kClockLpsciSrcNone* clock disabled  
*kClockLpsciSrcPllFllSel* clock as selected by SOPT2[PLLFLSEL].  
*kClockLpsciSrcOsc0erClk* OSCERCLK clock.  
*kClockLpsciSrcMcgIrClk* MCGIR clock.

### 66.2.60.3.5 enum clock\_sai\_src\_kw01z4\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.60.3.6 enum clock\_pllfl\_sel\_kw01z4\_t

Enumerator

*kClockPllFllSelFll* Fll clock.  
*kClockPllFllSelPll* Pll0 clock.

### 66.2.60.3.7 enum clock\_er32k\_src\_kw01z4\_t

Enumerator

*kClockEr32kSrcOsc0* OSC 32k clock.  
*kClockEr32kSrcReserved* Reserved.  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.60.3.8 enum clock\_clkout\_src\_kw01z4\_t

Enumerator

*kClockClkoutReserved* Reserved.  
*kClockClkoutReserved1* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutReserved2* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

### 66.2.60.3.9 enum clock\_rtcout\_src\_kw01z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32KHz clock

### 66.2.60.3.10 enum sim\_adc\_pretrg\_sel\_kw01z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.60.3.11 enum sim\_adc\_trg\_sel\_kw01z4\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved* Reserved.

## SIM HAL driver

*kSimAdcTrgSelReserved1* Reserved.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelReserved5* Reserved.

### 66.2.60.3.12 enum sim\_uart\_rxsrc\_kw01z4\_t

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.  
*kSimUartRxsrcCmp0* CMP0.

### 66.2.60.3.13 enum sim\_uart\_txsrc\_kw01z4\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.  
*kSimUartTxsrcTpm1* UARTx\_TX pin modulated with TPM1 channel 0 output.  
*kSimUartTxsrcTpm2* UARTx\_TX pin modulated with TPM2 channel 0 output.  
*kSimUartTxsrcReserved* Reserved.

### 66.2.60.3.14 enum sim\_lpsci\_rxsrc\_kw01z4\_t

Enumerator

*kSimLpsciRxsrcPin* LPSCIx\_RX Pin.  
*kSimLpsciRxsrcCmp0* CMP0.

### 66.2.60.3.15 enum sim\_lpsci\_txsrc\_kw01z4\_t

Enumerator

*kSimLpsciTxsrcPin* LPSCIx\_TX Pin.

*kSimLpsciTxsrcTpm1* LPSCIx\_TX pin modulated with TPM1 channel 0 output.  
*kSimLpsciTxsrcTpm2* LPSCIx\_TX pin modulated with TPM2 channel 0 output.  
*kSimLpsciTxsrcReserved* Reserved.

#### 66.2.60.3.16 enum sim\_tpm\_clk\_sel\_kw01z4\_t

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.  
*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.

#### 66.2.60.3.17 enum sim\_tpm\_ch\_src\_kw01z4\_t

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.  
*kSimTpmChSrc1* CMP0 output.  
*kSimTpmChSrc2* Reserved.  
*kSimTpmChSrc3* USB start of frame pulse.

#### 66.2.60.3.18 enum sim\_clock\_gate\_name\_kw01z4\_t

## SIM HAL driver

### 66.2.61 KW20Z4 SIM HAL driver

#### 66.2.61.1 Overview

The section describes the enumerations, macros and data structures for KW20Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKW20Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kw20z4\\_t](#) {

## 66.2.62.2 Macro Definition Documentation

66.2.62.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.62.3 Enumeration Type Documentation

### 66.2.62.3.1 enum clock\_trace\_src\_kw21d5\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

### 66.2.62.3.2 enum clock\_port\_filter\_src\_kw21d5\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.

*kClockPortFilterSrcLpoClk* LPO.

### 66.2.62.3.3 enum clock\_lptmr\_src\_kw21d5\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.62.3.4 enum clock\_time\_src\_kw21d5\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.

*kClockTimeSrcPllFllSel* clock as selected by SOPT2[PLLFLLSSEL].

*kClockTimeSrcOsc0erClk* OSCERCLK clock.

*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.62.3.5 enum clock\_usbfs\_src\_kw21d5\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)

*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

## SIM HAL driver

### 66.2.62.3.6 enum clock\_sai\_src\_kw21d5\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.62.3.7 enum clock\_pllfl\_sel\_kw21d5\_t

Enumerator

*kClockPllFlSelFl* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.

### 66.2.62.3.8 enum clock\_er32k\_src\_kw21d5\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.62.3.9 enum clock\_clkout\_src\_kw21d5\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelRtc32kClk* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.62.3.10 enum clock\_rtcout\_src\_kw21d5\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

**66.2.62.3.11 enum sim\_usbsstby\_mode\_kw21d5\_t**

## SIM HAL driver

### 66.2.63 KW22D5 SIM HAL driver

#### 66.2.63.1 Overview

The section describes the enumerations, macros and data structures for KW22D5 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKW22D5.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_wdog\\_src\\_kw22d5\\_t](#)  
*WDOG clock source select.*
- enum [clock\\_trace\\_src\\_kw22d5\\_t](#) {  
[kClockTraceSrcMcgoutClk](#),  
[kClockTraceSrcCoreClk](#) }  
*Debug trace clock source select.*
- enum [clock\\_port\\_filter\\_src\\_kw22d5\\_t](#) {  
[kClockPortFilterSrcBusClk](#),  
[kClockPortFilterSrcLpoClk](#) }  
*PORTx digital input filter clock source select.*
- enum [clock\\_lptmr\\_src\\_kw22d5\\_t](#) {  
[kClockLptmrSrcMcgIrClk](#),  
[kClockLptmrSrcLpoClk](#),  
[kClockLptmrSrcEr32kClk](#),  
[kClockLptmrSrcOsc0erClk](#) }  
*LPTMR clock source select.*
- enum [clock\\_time\\_src\\_kw22d5\\_t](#) {  
[kClockTimeSrcCoreSysClk](#),  
[kClockTimeSrcPIIFllSel](#),  
[kClockTimeSrcOsc0erClk](#),  
[kClockTimeSrcExt](#) }  
*SIM timestamp clock source.*
- enum [clock\\_usbfs\\_src\\_kw22d5\\_t](#) {

## 66.2.64.2 Macro Definition Documentation

66.2.64.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

## 66.2.64.3 Enumeration Type Documentation

### 66.2.64.3.1 enum clock\_trace\_src\_kw24d5\_t

Enumerator

*kClockTraceSrcMcgoutClk* MCG out clock.

*kClockTraceSrcCoreClk* core clock

### 66.2.64.3.2 enum clock\_port\_filter\_src\_kw24d5\_t

Enumerator

*kClockPortFilterSrcBusClk* Bus clock.

*kClockPortFilterSrcLpoClk* LPO.

### 66.2.64.3.3 enum clock\_lptmr\_src\_kw24d5\_t

Enumerator

*kClockLptmrSrcMcgIrClk* MCG IRC clock.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

### 66.2.64.3.4 enum clock\_time\_src\_kw24d5\_t

Enumerator

*kClockTimeSrcCoreSysClk* Core/system clock.

*kClockTimeSrcPllFllSel* clock as selected by SOPT2[PLLFLLSEL].

*kClockTimeSrcOsc0erClk* OSCERCLK clock.

*kClockTimeSrcExt* ENET 1588 clock in (ENET\_1588\_CLKIN)

### 66.2.64.3.5 enum clock\_usbfs\_src\_kw24d5\_t

Enumerator

*kClockUsbfsSrcExt* External bypass clock (USB\_CLKIN)

*kClockUsbfsSrcPllFllSel* Clock divider USB FS clock.

## SIM HAL driver

### 66.2.64.3.6 enum clock\_sai\_src\_kw24d5\_t

Enumerator

*kClockSaiSrcSysClk* SYSCLK.  
*kClockSaiSrcOsc0erClk* OSC0ERCLK.  
*kClockSaiSrcPllClk* MCGPLLCLK.

### 66.2.64.3.7 enum clock\_pllfl\_sel\_kw24d5\_t

Enumerator

*kClockPllFlSelFl* Fll clock.  
*kClockPllFlSelPll* Pll0 clock.

### 66.2.64.3.8 enum clock\_er32k\_src\_kw24d5\_t

Enumerator

*kClockEr32kSrcOsc0* OSC0 clock (OSC032KCLK).  
*kClockEr32kSrcRtc* RTC 32k clock .  
*kClockEr32kSrcLpo* LPO clock.

### 66.2.64.3.9 enum clock\_clkout\_src\_kw24d5\_t

Enumerator

*kClockClkoutSelFlashClk* Flash clock.  
*kClockClkoutSelLpoClk* LPO clock.  
*kClockClkoutSelMcgIrClk* MCG out clock.  
*kClockClkoutSelRtc32kClk* RTC 32k clock.  
*kClockClkoutSelOsc0erClk* OSCERCLK0 clock.

### 66.2.64.3.10 enum clock\_rtcout\_src\_kw24d5\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32kHz clock

**66.2.64.3.11 enum sim\_usbsstby\_mode\_kw24d5\_t**

Enumerator

*kSimUsbsstbyNoRegulator* regulator not in standby during Stop modes*kSimUsbsstbyWithRegulator* regulator in standby during Stop modes**66.2.64.3.12 enum sim\_usbvstby\_mode\_kw24d5\_t**

Enumerator

*kSimUsbvstbyNoRegulator* regulator not in standby during VLPR and VLPW modes*kSimUsbvstbyWithRegulator* regulator in standby during VLPR and VLPW modes**66.2.64.3.13 enum sim\_adc\_pretrg\_sel\_kw24d5\_t**

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.**66.2.64.3.14 enum sim\_adc\_trg\_sel\_kw24d5\_t**

Enumerator

*kSimAdcTrgSelExt* External trigger.*kSimAdcTrgSelHighSpeedComp0* High speed comparator 0 output.*kSimAdcTrgSelHighSpeedComp1* High speed comparator 1 output.*kSimAdcTrgSelPit0* PIT trigger 0.*kSimAdcTrgSelPit1* PIT trigger 1.*kSimAdcTrgSelPit2* PIT trigger 2.*kSimAdcTrgSelPit3* PIT trigger 3.*kSimAdcTrgSelFtm0* FTM0 trigger.*kSimAdcTrgSelFtm1* FTM1 trigger.*kSimAdcTrgSelFtm2* FTM2 trigger.*kSimAdcTrgSelRtcAlarm* RTC alarm.*kSimAdcTrgSelRtcSec* RTC seconds.*kSimAdcTrgSelLptimer* Low-power timer trigger.**66.2.64.3.15 enum sim\_uart\_rxsrc\_kw24d5\_t**

Enumerator

*kSimUartRxsrcPin* UARTx\_RX Pin.

## SIM HAL driver

*kSimUartRxsrcCmp0* CMP0.

*kSimUartRxsrcCmp1* CMP1.

### 66.2.64.3.16 enum sim\_uart\_txsrc\_kw24d5\_t

Enumerator

*kSimUartTxsrcPin* UARTx\_TX Pin.

*kSimUartTxsrcFtm1* UARTx\_TX pin modulated with FTM1 channel 0 output.

*kSimUartTxsrcFtm2* UARTx\_TX pin modulated with FTM2 channel 0 output.

### 66.2.64.3.17 enum sim\_ftm\_trg\_src\_kw24d5\_t

Enumerator

*kSimFtmTrgSrc0* FlexTimer x trigger y select 0.

*kSimFtmTrgSrc1* FlexTimer x trigger y select 1.

### 66.2.64.3.18 enum sim\_ftm\_clk\_sel\_kw24d5\_t

Enumerator

*kSimFtmClkSel0* FTM CLKIN0 pin.

*kSimFtmClkSel1* FTM CLKIN1 pin.

### 66.2.64.3.19 enum sim\_ftm\_ch\_src\_kw24d5\_t

Enumerator

*kSimFtmChSrc0* FlexTimer x channel y input capture source 0.

*kSimFtmChSrc1* FlexTimer x channel y input capture source 1.

*kSimFtmChSrc2* FlexTimer x channel y input capture source 2.

*kSimFtmChSrc3* FlexTimer x channel y input capture source 3.

### 66.2.64.3.20 enum sim\_ftmflt\_sel\_kw24d5\_t

Enumerator

*kSimFtmFltSel0* FlexTimer x fault y select 0.

*kSimFtmFltSel1* FlexTimer x fault y select 1.

**66.2.64.3.21 enum sim\_tpm\_clk\_sel\_kw24d5\_t**

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.**66.2.64.3.22 enum sim\_tpm\_ch\_src\_kw24d5\_t**

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.*kSimTpmChSrc1* CMP0 output.**66.2.64.3.23 enum sim\_cmtuartpad\_strenght\_kw24d5\_t**

Enumerator

*kSimCmtuartSinglePad* Single-pad drive strength for CMT IRO or UART0\_TXD.*kSimCmtuartDualPad* Dual-pad drive strength for CMT IRO or UART0\_TXD.**66.2.64.3.24 enum sim\_ptd7pad\_strenght\_kw24d5\_t**

Enumerator

### 66.2.65.2 Macro Definition Documentation

66.2.65.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.65.3 Enumeration Type Documentation

#### 66.2.65.3.1 enum [clock\\_cop\\_src\\_kw30z4\\_t](#)

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KW30Z4 it is Bus clock.

#### 66.2.65.3.2 enum [clock\\_tpm\\_src\\_kw30z4\\_t](#)

Enumerator

*kClockTpmSrcNone* clock disabled

*kClockTpmSrcMcgFllClk* FLL clock.

*kClockTpmSrcOsc0erClk* OSCERCLK clock.

*kClockTpmSrcMcgIrClk* MCGIR clock.

#### 66.2.65.3.3 enum [clock\\_lptmr\\_src\\_kw30z4\\_t](#)

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

#### 66.2.65.3.4 enum clock\_lpuart\_src\_kw30z4\_t

Enumerator

*kClockLpuartSrcNone* clock disabled  
*kClockLpuartSrcMcgFllClk* FLL clock.  
*kClockLpuartSrcOsc0erClk* OSCERCLK clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

#### 66.2.65.3.5 enum clock\_pllfl\_sel\_kw30z4\_t

Enumerator

*kClockPlIFllSelFll* Fll clock.  
*kClockPlIFllSelPll* Pll0 clock.

#### 66.2.65.3.6 enum clock\_er32k\_src\_kw30z4\_t

Enumerator

*kClockEr32kSrcOsc0* OSC 32k clock.  
*kClockEr32kSrcReserved* Reserved.  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

#### 66.2.65.3.7 enum clock\_clkout\_src\_kw30z4\_t

Enumerator

*kClockClkoutOsc0erClkDiv2* Reserved.  
*kClockClkoutOsc0erClkDiv4* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutOsc0erClkDiv8* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

## SIM HAL driver

### 66.2.65.3.8 enum clock\_rtcout\_src\_kw30z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32KHz clock

### 66.2.65.3.9 enum sim\_adc\_pretrg\_sel\_kw30z4\_t

Enumerator

*kSimAdcPretrgselA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgselB* Pre-trigger B selected for ADCx.

### 66.2.65.3.10 enum sim\_adc\_trg\_sel\_kw30z4\_t

Enumerator

*kSimAdcTrgselExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved* Reserved.  
*kSimAdcTrgSelReserved1* Reserved.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelRadioTsm* Radio TSM.

### 66.2.65.3.11 enum sim\_lpuart\_rxsrc\_kw30z4\_t

Enumerator

*kSimLpuartRxsSrcPin* UARTx\_RX Pin.  
*kSimLpuartRxsSrcCmp0* CMP0.

## SIM HAL driver

### 66.2.66 KW40Z4 SIM HAL driver

#### 66.2.66.1 Overview

The section describes the enumerations, macros and data structures for KW40Z4 SIM HAL driver.

#### Files

- file [fsl\\_sim\\_hal\\_MKW40Z4.h](#)

#### Macros

- #define [FSL\\_SIM\\_SCGC\\_BIT](#)(SCGCx, n) (((SCGCx-1U)<<5U) + n)  
*SIM SCGC bit index.*

#### Enumerations

- enum [clock\\_cop\\_src\\_kw40z4\\_t](#) {  
[kClockCopSrcLpoClk](#),  
[kClockCopSrcAltClk](#) }  
*COP clock source select.*
- enum [clock\\_tpm\\_src\\_kw40z4\\_t](#) {  
[kClockTpmSrcNone](#),  
[kClockTpmSrcMcgFllClk](#),  
[kClockTpmSrcOsc0erClk](#),  
[kClockTpmSrcMcgIrClk](#) }  
*TPM clock source select.*
- enum [clock\\_lptmr\\_src\\_kw40z4\\_t](#) {  
[kClockLptmrSrcMcgIrClk](#),  
[kClockLptmrSrcLpoClk](#),  
[kClockLptmrSrcEr32kClk](#),  
[kClockLptmrSrcOsc0erClk](#) }  
*LPTMR clock source select.*
- enum [clock\\_lpuart\\_src\\_kw40z4\\_t](#) {  
[kClockLpuartSrcNone](#),  
[kClockLpuartSrcMcgFllClk](#),  
[kClockLpuartSrcOsc0erClk](#),  
[kClockLpuartSrcMcgIrClk](#) }  
*LPUART0 clock source select.*
- enum [clock\\_pllfl\\_sel\\_kw40z4\\_t](#) {  
[kClockPllFlSelFll](#),  
[kClockPllFlSelPll](#) }  
*SIM PLLFLLSEL clock source select.*
- enum [clock\\_er32k\\_src\\_kw40z4\\_t](#) {

```

kClockEr32kSrcOsc0 = 0U,
kClockEr32kSrcReserved = 1U,
kClockEr32kSrcRtc = 2U,
kClockEr32kSrcLpo = 3U }

```

*SIM external reference clock source select (OSC32KSEL)*

- enum `clock_clkout_src_kw40z4_t` {

```

kClockClkoutOsc0erClkDiv2 = 0U,

*Clock gate name used for SIM\_HAL\_EnableClock/SIM\_HAL\_DisableClock.*

### 66.2.66.2 Macro Definition Documentation

66.2.66.2.1 `#define FSL_SIM_SCGC_BIT( SCGCx, n ) (((SCGCx-1U)<<5U) + n)`

### 66.2.66.3 Enumeration Type Documentation

#### 66.2.66.3.1 enum [clock\\_cop\\_src\\_kw40z4\\_t](#)

Enumerator

*kClockCopSrcLpoClk* LPO.

*kClockCopSrcAltClk* Alternative clock, for KW40Z4 it is Bus clock.

#### 66.2.66.3.2 enum [clock\\_tpm\\_src\\_kw40z4\\_t](#)

Enumerator

*kClockTpmSrcNone* clock disabled

*kClockTpmSrcMcgFllClk* FLL clock.

*kClockTpmSrcOsc0erClk* OSCERCLK clock.

*kClockTpmSrcMcgIrClk* MCGIR clock.

#### 66.2.66.3.3 enum [clock\\_lptmr\\_src\\_kw40z4\\_t](#)

Enumerator

*kClockLptmrSrcMcgIrClk* MCG out clock.

*kClockLptmrSrcLpoClk* LPO clock.

*kClockLptmrSrcEr32kClk* ERCLK32K clock.

*kClockLptmrSrcOsc0erClk* OSCERCLK clock.

#### 66.2.66.3.4 enum clock\_lpuart\_src\_kw40z4\_t

Enumerator

*kClockLpuartSrcNone* clock disabled  
*kClockLpuartSrcMcgFllClk* FLL clock.  
*kClockLpuartSrcOsc0erClk* OSCERCLK clock.  
*kClockLpuartSrcMcgIrClk* MCGIR clock.

#### 66.2.66.3.5 enum clock\_pllfl\_sel\_kw40z4\_t

Enumerator

*kClockPlIFllSelFll* Fll clock.  
*kClockPlIFllSelPll* Pll0 clock.

#### 66.2.66.3.6 enum clock\_er32k\_src\_kw40z4\_t

Enumerator

*kClockEr32kSrcOsc0* OSC 32k clock.  
*kClockEr32kSrcReserved* Reserved.  
*kClockEr32kSrcRtc* RTC 32k clock.  
*kClockEr32kSrcLpo* LPO clock.

#### 66.2.66.3.7 enum clock\_clkout\_src\_kw40z4\_t

Enumerator

*kClockClkoutOsc0erClkDiv2* Reserved.  
*kClockClkoutOsc0erClkDiv4* Reserved.  
*kClockClkoutBusClk* Bus clock.  
*kClockClkoutLpoClk* LPO clock.  
*kClockClkoutMcgIrClk* MCG ir clock.  
*kClockClkoutOsc0erClkDiv8* Reserved.  
*kClockClkoutOsc0erClk* OSC0ER clock.  
*kClockClkoutReserved3* Reserved.

## SIM HAL driver

### 66.2.66.3.8 enum clock\_rtcout\_src\_kw40z4\_t

Enumerator

*kClockRtcoutSrc1Hz* 1Hz clock  
*kClockRtcoutSrc32kHz* 32KHz clock

### 66.2.66.3.9 enum sim\_adc\_pretrg\_sel\_kw40z4\_t

Enumerator

*kSimAdcPretrgSelA* Pre-trigger A selected for ADCx.  
*kSimAdcPretrgSelB* Pre-trigger B selected for ADCx.

### 66.2.66.3.10 enum sim\_adc\_trg\_sel\_kw40z4\_t

Enumerator

*kSimAdcTrgSelExt* External trigger.  
*kSimAdcTrgSelComp0* CMP0 output.  
*kSimAdcTrgSelReserved* Reserved.  
*kSimAdcTrgSelReserved1* Reserved.  
*kSimAdcTrgSelPit0* PIT trigger 0.  
*kSimAdcTrgSelPit1* PIT trigger 1.  
*kSimAdcTrgSelReserved2* Reserved.  
*kSimAdcTrgSelReserved3* Reserved.  
*kSimAdcTrgSelTpm0* TPM0 overflow.  
*kSimAdcTrgSelTpm1* TPM1 overflow.  
*kSimAdcTrgSelTpm2* TPM2 overflow.  
*kSimAdcTrgSelReserved4* Reserved.  
*kSimAdcTrgSelRtcAlarm* RTC alarm.  
*kSimAdcTrgSelRtcSec* RTC seconds.  
*kSimAdcTrgSelLptimer* Low-power timer trigger.  
*kSimAdcTrgSelRadioTsm* Radio TSM.

### 66.2.66.3.11 enum sim\_lpuart\_rxsrc\_kw40z4\_t

Enumerator

*kSimLpuartRxsrcPin* UARTx\_RX Pin.  
*kSimLpuartRxsrcCmp0* CMP0.

**66.2.66.3.12 enum sim\_lpuart\_txsrc\_kw40z4\_t**

Enumerator

*kSimLpuartTxsrcPin* LPUARTx\_TX Pin.*kSimLpuartTxsrcTpm1* LPUARTx\_TX pin modulated with TPM1 channel 0 output.*kSimLpuartTxsrcTpm2* LPUARTx\_TX pin modulated with TPM2 channel 0 output.*kSimLpuartTxsrcReserved* Reserved.**66.2.66.3.13 enum sim\_tpm\_clk\_sel\_kw40z4\_t**

Enumerator

*kSimTpmClkSel0* Timer/PWM TPM\_CLKIN0 pin.*kSimTpmClkSel1* Timer/PWM TPM\_CLKIN1 pin.**66.2.66.3.14 enum sim\_tpm\_ch\_src\_kw40z4\_t**

Enumerator

*kSimTpmChSrc0* TPMx\_CH0 signal.*kSimTpmChSrc1* CMP0 output.**66.2.66.3.15 enum sim\_clock\_gate\_name\_kw40z4\_t**

## Chapter 67 LCD (SLCD)

### 67.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the segment LCD (SLCD) block of Kinetis devices.

#### Modules

- [SLCD HAL driver](#)
- [SLCD Peripheral driver](#)

## SLCD Peripheral driver

### 67.2 SLCD Peripheral driver

#### 67.2.1 Overview

This section describes the programming interface of the SLCD Peripheral driver. The SLCD driver configures SLCD.

#### 67.2.2 Initialization

To initialize the SLCD module, call the `SLCD_DRV_Init()` function and provide the user configuration data structure. This function sets the configuration of the SLCD module automatically and enables the SLCD module.

Note that if the configuration does not enable the SLCD, the application enables it after the configurations are completed.

This is example code to configure the SLCD driver:

```
slcd_work_mode_t lowPowerMode =
{
 .kSLCDEnableInDozeMode = false,
 .kSLCDEnableInStopMode = false,
};
slcd_user_config_t init =
{
 .clkSrc = kSLCDDefaultClk,
 .alterClkDiv = kSLCDAltClkDivFactor1,
 .powerSupply = kSLCDPowerInternalV113AndChargePump,
 .loadAdjust = kSLCDHighLoadOrSlowestClkSrc,
 .dutyCyc = kSLCD1Div8DutyCyc,
 .frameFreqDiv = kSLCDClkPrescaler02,
 .trim = kSLCDRegulatedVolatgeTrim08,
 .slcdIntEnabled = true,
 .workMode = lowPowerMode,
};
slcd_pins_config_t pinsConfig =
{
 .slcdLowPinsEnabled = 0x9FFFFFFE0,
 .slcdHighPinsEnabled = 0x0000083F,
 .slcdBackPlaneLowPinsEnabled = 0x0001FE00,
 .slcdBackPlaneHighPinsEnabled = 0x00000000,
};
slcd_fault_detect_config_t faultDetectConfig =
{
 .faultDetectCompleteIntEnabled = true,
 .faultDetectBackPlaneEnabled = true,
 .faultDetectPinIndex = 0,
 .prescaler = kSLCDFaultSampleFreq1BusClk,
 .winWidth = kSLCDFaultDetectWinWidth4SampleClk,
};
slcd_blink_config_t blinkConfig =
{
 .blinkRate = kSLCDBlinkRate01,
 .blinkMode = kSLCDAltDisplay,
};
configure_lcd_pins(0);

SLCD_DRV_Init(0, &init);

SLCD_DRV_SetAllPinsConfig(0, &pinsConfig);
```

## Data Structures

- struct [slcd\\_pins\\_config\\_t](#)  
*This structure describes SLCD pin configuration. [More...](#)*
- struct [slcd\\_user\\_config\\_t](#)  
*This structure describes the programming interface of the for SLCD initialization. [More...](#)*

## Variables

- LCD\_Type \*const [g\\_slcdBase](#) [LCD\_INSTANCE\_COUNT]  
*Table of base addresses for SLCD instances.*
- const IRQn\_Type [g\\_slcdIrqId](#) [LCD\_INSTANCE\_COUNT]  
*Table to save SLCD IRQ enumeration numbers defined in the CMSIS header file.*

## SLCD Driver

- [slcd\\_status\\_t](#) [SLCD\\_DRV\\_Init](#) (uint32\_t instance, const [slcd\\_user\\_config\\_t](#) \*userConfigPtr)  
*Initializes the SLCD driver.*
- void [SLCD\\_DRV\\_Deinit](#) (uint32\_t instance)  
*Deinitializes the SLCD driver.*
- void [SLCD\\_DRV\\_Start](#) (uint32\_t instance)  
*Starts the SLCD driver.*
- void [SLCD\\_DRV\\_Stop](#) (uint32\_t instance)  
*Stops the SLCD driver.*
- void [SLCD\\_DRV\\_SetIntCmd](#) (uint32\_t instance, [slcd\\_int\\_type\\_t](#) intType, bool enable)  
*Configures the SLCD interrupt.*
- [slcd\\_status\\_t](#) [SLCD\\_DRV\\_StartFaultDetection](#) (uint32\_t instance, const [slcd\\_fault\\_detect\\_config\\_t](#) \*faultDetectConfigPtr)  
*Starts the SLCD fault detection.*
- bool [SLCD\\_DRV\\_CheckFaultDetectCompleteFlag](#) (uint32\_t instance)  
*Returns the fault detection configuration.*
- void [SLCD\\_DRV\\_ClearFaultDetectCompleteFlag](#) (uint32\_t instance)  
*Clears the fault detection complete flag.*
- uint8\_t [SLCD\\_DRV\\_GetFaultDetectCounter](#) (uint32\_t instance)  
*Returns the fault detection counter.*
- bool [SLCD\\_DRV\\_CheckFrameFrequencyIntFlag](#) (uint32\_t instance)  
*Checks whether the SLCD frame frequency interrupt is enabled or disabled.*
- void [SLCD\\_DRV\\_ClearFrameFrequencyIntFlag](#) (uint32\_t instance)  
*Clears the SLCD frame frequency interrupt flag.*
- [slcd\\_status\\_t](#) [SLCD\\_DRV\\_StartBlinkingMode](#) (uint32\_t instance, const [slcd\\_blink\\_config\\_t](#) \*blinkConfigPtr)  
*Starts the SLCD blinking mode.*
- void [SLCD\\_DRV\\_StopBlinkingMode](#) (uint32\_t instance)  
*Stops the SLCD blinking mode.*
- void [SLCD\\_DRV\\_SetAltDisplayModeCmd](#) (uint32\_t instance, bool enable)  
*Starts/stops the SLCD alternating display mode.*
- void [SLCD\\_DRV\\_SetBlankDisplayModeCmd](#) (uint32\_t instance, bool enable)  
*Starts/stops the SLCD blank display mode.*

## SLCD Peripheral driver

- `slcd_status_t SLCD_DRV_SetAllPinsConfig` (uint32\_t instance, const `slcd_pins_config_t` \*pins-ConfigPtr)  
*Sets all SLCD pin configurations.*
- void `SLCD_DRV_SetPinWaveForm` (uint32\_t instance, uint8\_t pinIndex, uint8\_t waveForm)  
*Sets all SLCD pin waveforms.*
- void `SLCD_DRV_SetBackPlanePhase` (uint32\_t instance, uint8\_t pinIndex, `slcd_phase_index_t` phase)  
*Sets the SLCD back plane phase.*
- void `SLCD_DRV_SetSegmentEnableCmd` (uint32\_t instance, uint8\_t pinIndex, `slcd_phase_index_t` phaseIndex, bool enable)  
*Configures an SLCD pin segment.*

### 67.2.3 Data Structure Documentation

#### 67.2.3.1 struct `slcd_pins_config_t`

This structure is used when calling the `SLCD_DRV_Init` function.

##### Data Fields

- uint32\_t `slcdLowPinsEnabled`  
*low pins from 0 to 31 and if one bit is set means the corresponding pin is enabled*
- uint32\_t `slcdHighPinsEnabled`  
*high pins from 32 to 63 and if one bit is set means the corresponding pin is enabled*
- uint32\_t `slcdBackPlaneLowPinsEnabled`  
*low pins from 0 to 31 and if one bit is set means the corresponding pin is configured as back plane*
- uint32\_t `slcdBackPlaneHighPinsEnabled`  
*high pins from 32 to 63 and if the bit is set means the corresponding pin is configured as back plane*

#### 67.2.3.2 struct `slcd_user_config_t`

This structure is used when calling the `SLCD_DRV_Init` function.

##### Data Fields

- `slcd_clk_config_t` `clkConfig`  
*Configures SLCD clock and frame frequency.*
- `slcd_power_supply_option_t` `powerSupply`  
*Configures SLCD power supply.*
- `slcd_load_adjust_t` `loadAdjust`  
*Configures charge pump or resistor bias to handle different LCD glass capacitance.*
- `slcd_duty_cyc_t` `dutyCyc`  
*Selects the duty cycle of the LCD controller driver.*
- `slcd_regulated_voltage_trim_t` `trim`  
*Adjusts SLCD contrast.*
- bool `slcdIntEnable`

- SLCD interrupt enable or disable.*

  - [slcd\\_work\\_mode\\_t workMode](#)  
*Configures SLCD low power work mode.*

## 67.2.4 Function Documentation

### 67.2.4.1 `slcd_status_t SLCD_DRV_Init ( uint32_t instance, const slcd_user_config_t * userConfigPtr )`

Parameters

|                      |                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------|
| <i>instance</i>      | The SLCD peripheral instance number.                                                       |
| <i>userConfigPtr</i> | The pointer to the SLCD user configure structure, see <a href="#">slcd_user_config_t</a> . |

Returns

kStatus\_SLCD\_Success means success. Otherwise, means failure.

### 67.2.4.2 `void SLCD_DRV_Deinit ( uint32_t instance )`

Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

Returns

kStatus\_SLCD\_Success means success. Otherwise, means failure.

### 67.2.4.3 `void SLCD_DRV_Start ( uint32_t instance )`

Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

### 67.2.4.4 `void SLCD_DRV_Stop ( uint32_t instance )`

## SLCD Peripheral driver

### Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

### 67.2.4.5 void SLCD\_DRV\_SetIntCmd ( uint32\_t *instance*, slcd\_int\_type\_t *intType*, bool *enable* )

### Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
| <i>intType</i>  | interrupt type.                      |
| <i>enable</i>   | Enables or Disables interrupt.       |

### 67.2.4.6 slcd\_status\_t SLCD\_DRV\_StartFaultDetection ( uint32\_t *instance*, const slcd\_fault\_detect\_config\_t \* *faultDetectConfigPtr* )

### Parameters

|                              |                                                |
|------------------------------|------------------------------------------------|
| <i>instance</i>              | The SLCD peripheral instance number.           |
| <i>faultDetect-ConfigPtr</i> | The pointer to SLCD configure fault detection. |

### Returns

kStatus\_SLCD\_Success means success. Otherwise, means failure.

### 67.2.4.7 bool SLCD\_DRV\_CheckFaultDetectCompleteFlag ( uint32\_t *instance* )

### Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

### Returns

true Fault detection is complete.  
false Fault detection is not complete.

### 67.2.4.8 void SLCD\_DRV\_ClearFaultDetectCompleteFlag ( uint32\_t *instance* )

Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

**67.2.4.9 uint8\_t SLCD\_DRV\_GetFaultDetectCounter ( uint32\_t *instance* )**

Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

Returns

The fault detection counter value.

**67.2.4.10 bool SLCD\_DRV\_CheckFrameFrequencyIntFlag ( uint32\_t *instance* )**

Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

Returns

True This event causes an interrupt request.  
 False No interrupt request is generated by this event.

**67.2.4.11 void SLCD\_DRV\_ClearFrameFrequencyIntFlag ( uint32\_t *instance* )**

Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

**67.2.4.12 slcd\_status\_t SLCD\_DRV\_StartBlinkingMode ( uint32\_t *instance*, const slcd\_blink\_config\_t \* *blinkConfigPtr* )**

## SLCD Peripheral driver

### Parameters

|                       |                                                         |
|-----------------------|---------------------------------------------------------|
| <i>instance</i>       | The SLCD peripheral instance number.                    |
| <i>blinkConfigPtr</i> | The pointer used to configure SLCD blink configuration. |

### Returns

kStatus\_SLCD\_Success means success. Otherwise, means failure.

#### 67.2.4.13 void SLCD\_DRV\_StopBlinkingMode ( uint32\_t *instance* )

### Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
|-----------------|--------------------------------------|

#### 67.2.4.14 void SLCD\_DRV\_SetAltDisplayModeCmd ( uint32\_t *instance*, bool *enable* )

### Parameters

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number.          |
| <i>enable</i>   | Disable/Enable SLCD alternating display mode. |

#### 67.2.4.15 void SLCD\_DRV\_SetBlankDisplayModeCmd ( uint32\_t *instance*, bool *enable* )

### Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number.    |
| <i>enable</i>   | Disable/Enable SLCD blank display mode. |

#### 67.2.4.16 slcd\_status\_t SLCD\_DRV\_SetAllPinsConfig ( uint32\_t *instance*, const slcd\_pins\_config\_t \* *pinsConfigPtr* )

### Parameters

---

|                      |                                          |
|----------------------|------------------------------------------|
| <i>instance</i>      | The SLCD peripheral instance number.     |
| <i>pinsConfigPtr</i> | The pointer used to configure SLCD pins. |

Returns

kStatus\_SLCD\_Success means success. Otherwise, means failure.

**67.2.4.17 void SLCD\_DRV\_SetPinWaveForm ( uint32\_t *instance*, uint8\_t *pinIndex*, uint8\_t *waveForm* )**

Parameters

|                 |                                                   |
|-----------------|---------------------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number.              |
| <i>pinIndex</i> | The configured SLCD pin index form 0 to 63.       |
| <i>waveForm</i> | The waveForm used to configure the pin wave form. |

**67.2.4.18 void SLCD\_DRV\_SetBackPlanePhase ( uint32\_t *instance*, uint8\_t *pinIndex*, slcd\_phase\_index\_t *phase* )**

Parameters

|                 |                                             |
|-----------------|---------------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number.        |
| <i>pinIndex</i> | The configured SLCD pin index form 0 to 63. |
| <i>phase</i>    | The configured segment from 0 to 7.         |

**67.2.4.19 void SLCD\_DRV\_SetSegmentEnableCmd ( uint32\_t *instance*, uint8\_t *pinIndex*, slcd\_phase\_index\_t *phaseIndex*, bool *enable* )**

Parameters

|                 |                                      |
|-----------------|--------------------------------------|
| <i>instance</i> | The SLCD peripheral instance number. |
| <i>pinIndex</i> | The specific pin index from 0 to 63. |

## SLCD Peripheral driver

|                   |                                     |
|-------------------|-------------------------------------|
| <i>phaseIndex</i> | The configured segment from 0 to 7. |
| <i>enable</i>     | Enable/Disable the segment.         |

### 67.2.5 Variable Documentation

67.2.5.1 `LCD_Type* const g_slcdBase[LCD_INSTANCE_COUNT]`

67.2.5.2 `const IRQn_Type g_slcdIrqId[LCD_INSTANCE_COUNT]`

## 67.3 SLCD HAL driver

### 67.3.1 Overview

This section describes the programming interface of the SLCD HAL driver.

#### Data Structures

- struct `slcd_blink_config_t`  
*This structure describes SLCD blink configuration. [More...](#)*
- struct `slcd_fault_detect_config_t`  
*This structure describes SLCD fault detection configuration. [More...](#)*
- struct `slcd_work_mode_t`  
*This union structure describes SLCD work mode configuration. [More...](#)*
- struct `slcd_clk_config_t`  
*This structure describes SLCD clock and frame configuration. [More...](#)*

#### Enumerations

- enum `slcd_load_adjust_t` {  
`kSLCDLowLoadOrFastestClkSrc = 0U,`  
`kSLCDLowLoadOrIntermediateClkSrc = 1U,`  
`kSLCDHighLoadOrIntermediateClkSrc = 2U,`  
`kSLCDHighLoadOrSlowestClkSrc = 3U }`  
*SLCD to handle different LCD glass capacitance.*
- enum `slcd_regulated_voltage_trim_t` {  
`kSLCDRegulatedVolatgeTrim00 = 0U,`  
`kSLCDRegulatedVolatgeTrim01 = 1U,`  
`kSLCDRegulatedVolatgeTrim02 = 2U,`  
`kSLCDRegulatedVolatgeTrim03 = 3U,`  
`kSLCDRegulatedVolatgeTrim04 = 4U,`  
`kSLCDRegulatedVolatgeTrim05 = 5U,`  
`kSLCDRegulatedVolatgeTrim06 = 6U,`  
`kSLCDRegulatedVolatgeTrim07 = 7U,`  
`kSLCDRegulatedVolatgeTrim08 = 8U,`  
`kSLCDRegulatedVolatgeTrim09 = 9U,`  
`kSLCDRegulatedVolatgeTrim10 = 10U,`  
`kSLCDRegulatedVolatgeTrim11 = 11U,`  
`kSLCDRegulatedVolatgeTrim12 = 12U,`  
`kSLCDRegulatedVolatgeTrim13 = 13U,`  
`kSLCDRegulatedVolatgeTrim14 = 14U,`  
`kSLCDRegulatedVolatgeTrim15 = 15U }`  
*adjust the regulated voltage to meet the desired contrast*
- enum `slcd_alt_clk_div_t` {

## SLCD HAL driver

```
kSLCDAItClkDivFactor1 = 0U,
kSLCDAItClkDivFactor64 = 1U,
kSLCDAItClkDivFactor256 = 2U,
kSLCDAItClkDivFactor512 = 3U }
```

*SLCD alternate clock divider.*

- enum `slcd_clk_src_t` {
 

```
kSLCDDefaultClk = 0U,
kSLCDAAlternateClk = 1U }
```

*SLCD clock source.*

- enum `slcd_alt_clk_src_t` {
 

```
kSLCDAItClkSrc1 = 0U,
kSLCDAItClkSrc2 = 1U }
```

*SLCD alternate clock source.*

- enum `slcd_clk_prescaler_t` {
 

```
kSLCDCClkPrescaler00 = 0U,
kSLCDCClkPrescaler01 = 1U,
kSLCDCClkPrescaler02 = 2U,
kSLCDCClkPrescaler03 = 3U,
kSLCDCClkPrescaler04 = 4U,
kSLCDCClkPrescaler05 = 5U,
kSLCDCClkPrescaler06 = 6U,
kSLCDCClkPrescaler07 = 7U }
```

*SLCD clock prescaler to generate frame frequency.*

- enum `slcd_duty_cyc_t` {
 

```
kSLCD1DutyCyc = 0U,
kSLCD1Div2DutyCyc = 1U,
kSLCD1Div3DutyCyc = 2U,
kSLCD1Div4DutyCyc = 3U,
kSLCD1Div5DutyCyc = 4U,
kSLCD1Div6DutyCyc = 5U,
kSLCD1Div7DutyCyc = 6U,
kSLCD1Div8DutyCyc = 7U }
```

*SLCD duty cycle.*

- enum `slcd_phase_index_t` {
 

```
kSLCDPhaseA = 0U,
kSLCDPhaseB = 1U,
kSLCDPhaseC = 2U,
kSLCDPhaseD = 3U,
kSLCDPhaseE = 4U,
kSLCDPhaseF = 5U,
kSLCDPhaseG = 6U,
kSLCDPhaseH = 7U }
```

*SLCD segment index.*

- enum `slcd_blink_mode_t` {
 

```
kSLCDBlankDisplay = 0U,
kSLCDAItDisplay = 1U }
```

- SLCD blink mode.*

  - enum `slcd_blink_rate_t` {
    - `kSLCDBlinkRate00` = 0U,

    - `kSLCDFaultDetectWinWidth128SampleClk` = 5U,
    - `kSLCDFaultDetectWinWidth256SampleClk` = 6U,
    - `kSLCDFaultDetectWinWidth512SampleClk` = 7U }

*SLCD fault detect sample window width.*
- enum `slcd_int_type_t` {
    - `kSLCDFrameFreqInt` = 1U,
    - `kSLCDFaultDetectionCompleteInt` = 2U,
    - `kSLCDEnableAllInt` = 3U }

*This enum structure describes SLCD interrupt configuration.*

## SLCD HAL driver

- enum `slcd_status_t` {  
`kStatus_SLCD_Success` = 0x0U,  
`kStatus_SLCD_NullArgument` = 0x1U,  
`kStatus_SLCD_Fail` = 0x2U }  
*SLCD status return codes.*

## SLCD HAL.

### SLCD

- static void `SLCD_HAL_Enable` (LCD\_Type \*base)  
*Enables the SLCD module operation.*
- static void `SLCD_HAL_Disable` (LCD\_Type \*base)  
*Disables the SLCD module operation.*
- static void `SLCD_HAL_SetDutyCyc` (LCD\_Type \*base, `slcd_duty_cyc_t` dutyCyc)  
*Configures the SLCD duty cycle.*
- static void `SLCD_HAL_SetBlinkCmd` (LCD\_Type \*base, bool enable)  
*Configures the SLCD blink command.*
- static void `SLCD_HAL_SetAltDisplayModeCmd` (LCD\_Type \*base, bool enable)  
*Configures the SLCD display mode.*
- static void `SLCD_HAL_SetBlankDisplayModeCmd` (LCD\_Type \*base, bool enable)  
*Configures the SLCD blank mode.*
- static void `SLCD_HAL_SetFaultDetectCmd` (LCD\_Type \*base, bool enable)  
*Configures the SLCD fault detection enable.*
- static bool `SLCD_HAL_GetFaultDetectCompleteFlag` (LCD\_Type \*base)  
*Returns the SLCD fault detect complete flag.*
- static void `SLCD_HAL_ClearFaultDetectCompleteFlag` (LCD\_Type \*base)  
*Clears the SLCD fault detect complete flag.*
- static uint32\_t `SLCD_HAL_GetFaultDetectCounter` (LCD\_Type \*base)  
*Returns the SLCD fault detect counter.*
- static void `SLCD_HAL_SetPinsEnableCmd` (LCD\_Type \*base, uint8\_t highReg, uint32\_t data)  
*Configures all SLCD pins enabled states.*
- static void `SLCD_HAL_SetBackPlanePinsEnableCmd` (LCD\_Type \*base, uint8\_t highReg, uint32\_t data)  
*Configures all SLCD pins type in high back plane register.*
- static void `SLCD_HAL_SetPinWaveForm` (LCD\_Type \*base, uint8\_t pinIndex, uint8\_t waveForm)  
*Configures the SLCD pin waveform phase.*
- static void `SLCD_HAL_SetBackPlanePhase` (LCD\_Type \*base, uint8\_t pinIndex, `slcd_phase_index_t` phase)  
*Configures the SLCD pin waveform phase.*
- static void `SLCD_HAL_SetPinWaveFormPhaseCmd` (LCD\_Type \*base, uint8\_t pinIndex, `slcd_phase_index_t` phaseIndex, bool enable)  
*Configures the SLCD pin waveform one phase.*
- void `SLCD_HAL_VoltageAndPowerSupplyConfig` (LCD\_Type \*base, `slcd_power_supply_option_t` powerSupply, `slcd_load_adjust_t` loadAdjust, `slcd_regulated_voltage_trim_t` trim)  
*Configures the SLCD voltage and power supply.*
- void `SLCD_HAL_ClockConfig` (LCD\_Type \*base, const `slcd_clk_config_t` \*clkConfigPtr)  
*Configures the SLCD clock.*
- void `SLCD_HAL_BlinkingModeConfig` (LCD\_Type \*base, const `slcd_blink_config_t` \*blink-

ConfigPtr)

*Configures the SLCD blinking mode.*

- void [SLCD\\_HAL\\_FaultDetectionConfig](#) (LCD\_Type \*base, const [slcd\\_fault\\_detect\\_config\\_t](#) \*faultDetectConfigPtr)

*Configures the SLCD fault detection.*

- void [SLCD\\_HAL\\_SetLowPowerModeConfig](#) (LCD\_Type \*base, const [slcd\\_work\\_mode\\_t](#) \*workMode)

*Configures the SLCD running status in doze mode.*

- void [SLCD\\_HAL\\_SetIntCmd](#) (LCD\_Type \*base, [slcd\\_int\\_type\\_t](#) intType, bool enable)

*Configures the SLCD frame frequency interrupt.*

- void [SLCD\\_HAL\\_Init](#) (LCD\_Type \*base)

*Configures the SLCD to a workable state.*

## 67.3.2 Data Structure Documentation

### 67.3.2.1 struct [slcd\\_blink\\_config\\_t](#)

#### Data Fields

- [slcd\\_blink\\_rate\\_t](#) [blinkRate](#)  
*SLCD blinking frequency configuration.*
- [slcd\\_blink\\_mode\\_t](#) [blinkMode](#)  
*Selects the SLCD display mode during blinking period.*

### 67.3.2.2 struct [slcd\\_fault\\_detect\\_config\\_t](#)

#### Data Fields

- bool [faultDetectCompleteIntEnabled](#)  
*Fault detect complete interrupt enabled or disabled.*
- bool [faultDetectBackPlaneEnabled](#)  
*True means the type of pin id that fault detected is back plane otherwise front plane.*
- [uint8\\_t](#) [faultDetectPinIndex](#)  
*Fault detected pin id from 0 to 63.*
- [slcd\\_fault\\_detect\\_clk\\_prescaler\\_t](#) [prescaler](#)  
*Fault detected clock prescaler.*
- [slcd\\_fault\\_detect\\_sample\\_win\\_width\\_t](#) [winWidth](#)  
*Fault detected sample window width.*

### 67.3.2.3 struct [slcd\\_work\\_mode\\_t](#)

#### Data Fields

- bool [kSLCDEnableInDozeMode](#)  
*false means enabled in doze mode*
- bool [kSLCDEnableInStopMode](#)  
*false means enabled in stop mode*

## SLCD HAL driver

### 67.3.2.4 struct slcd\_clk\_config\_t

#### Data Fields

- [slcd\\_clk\\_src\\_t clkSrc](#)  
*Clock source.*
- [slcd\\_alt\\_clk\\_div\\_t altClkDiv](#)  
*Functions as a clock divider to divide the alternate clock before it is selected as LCD clock source.*
- [slcd\\_clk\\_prescaler\\_t clkPrescaler](#)  
*Clock prescaler.*

### 67.3.3 Enumeration Type Documentation

#### 67.3.3.1 enum slcd\_load\_adjust\_t

Enumerator

- kSLCDLowLoadOrFastestClkSrc*** Adjust the resistor bias network in low load or selects fastest clock for charge pump.
- kSLCDLowLoadOrIntermediateClkSrc*** Adjust the resistor bias network in low load or selects intermediate clock for charge pump.
- kSLCDHighLoadOrIntermediateClkSrc*** Adjust the resistor bias network in high load or selects intermediate clock for charge pump.
- kSLCDHighLoadOrSlowestClkSrc*** Adjust the resistor bias network in high load or selects slowest clock for charge pump.

#### 67.3.3.2 enum slcd\_regulated\_voltage\_trim\_t

Enumerator

- kSLCDRegulatedVolatgeTrim00*** Increase the voltage to 0.91 V.
- kSLCDRegulatedVolatgeTrim01*** Increase the voltage to 1.01 V.
- kSLCDRegulatedVolatgeTrim02*** Increase the voltage to 0.96 V.
- kSLCDRegulatedVolatgeTrim03*** Increase the voltage to 1.06 V.
- kSLCDRegulatedVolatgeTrim04*** Increase the voltage to 0.93 V.
- kSLCDRegulatedVolatgeTrim05*** Increase the voltage to 1.02 V.
- kSLCDRegulatedVolatgeTrim06*** Increase the voltage to 0.98 V.
- kSLCDRegulatedVolatgeTrim07*** Increase the voltage to 1.08 V.
- kSLCDRegulatedVolatgeTrim08*** Increase the voltage to 0.92 V.
- kSLCDRegulatedVolatgeTrim09*** Increase the voltage to 1.02 V.
- kSLCDRegulatedVolatgeTrim10*** Increase the voltage to 0.97 V.
- kSLCDRegulatedVolatgeTrim11*** Increase the voltage to 1.07 V.
- kSLCDRegulatedVolatgeTrim12*** Increase the voltage to 0.94 V.
- kSLCDRegulatedVolatgeTrim13*** Increase the voltage to 1.05 V.
- kSLCDRegulatedVolatgeTrim14*** Increase the voltage to 0.99 V.

*kSLCDRegulatedVolatgeTrim15* Increase the voltage to 1.09 V.

### 67.3.3.3 enum slcd\_alt\_clk\_div\_t

Enumerator

*kSLCDAltClkDivFactor1* No divide for alternate clock.  
*kSLCDAltClkDivFactor64* Divide alternate clock with factor 64.  
*kSLCDAltClkDivFactor256* Divide alternate clock with factor 256.  
*kSLCDAltClkDivFactor512* Divide alternate clock with factor 512.

### 67.3.3.4 enum slcd\_clk\_src\_t

Enumerator

*kSLCDDefaultClk* Select default clock as lcd clock source.  
*kSLCDAlternateClk* Select alternate clock as lcd clock source.

### 67.3.3.5 enum slcd\_alt\_clk\_src\_t

Enumerator

*kSLCDAltClkSrc1* Select default alternate clock.  
*kSLCDAltClkSrc2* Select alternate clock source 2.

### 67.3.3.6 enum slcd\_clk\_prescaler\_t

Enumerator

*kSLCDClkPrescaler00* Prescaler 0.  
*kSLCDClkPrescaler01* Prescaler 1.  
*kSLCDClkPrescaler02* Prescaler 2.  
*kSLCDClkPrescaler03* Prescaler 3.  
*kSLCDClkPrescaler04* Prescaler 4.  
*kSLCDClkPrescaler05* Prescaler 5.  
*kSLCDClkPrescaler06* Prescaler 6.  
*kSLCDClkPrescaler07* Prescaler 7.

## SLCD HAL driver

### 67.3.3.7 enum slcd\_duty\_cyc\_t

Enumerator

- kSLCD1DutyCyc* LCD use 1/1 duty cycle.
- kSLCD1Div2DutyCyc* LCD use 1/2 duty cycle.
- kSLCD1Div3DutyCyc* LCD use 1/3 duty cycle.
- kSLCD1Div4DutyCyc* LCD use 1/4 duty cycle.
- kSLCD1Div5DutyCyc* LCD use 1/5 duty cycle.
- kSLCD1Div6DutyCyc* LCD use 1/6 duty cycle.
- kSLCD1Div7DutyCyc* LCD use 1/7 duty cycle.
- kSLCD1Div8DutyCyc* LCD use 1/8 duty cycle.

### 67.3.3.8 enum slcd\_phase\_index\_t

Enumerator

- kSLCDPhaseA* LCD waveform phase A.
- kSLCDPhaseB* LCD waveform phase B.
- kSLCDPhaseC* LCD waveform phase C.
- kSLCDPhaseD* LCD waveform phase D.
- kSLCDPhaseE* LCD waveform phase E.
- kSLCDPhaseF* LCD waveform phase F.
- kSLCDPhaseG* LCD waveform phase G.
- kSLCDPhaseH* LCD waveform phase H.

### 67.3.3.9 enum slcd\_blink\_mode\_t

Enumerator

- kSLCDBlinkDisplay* Display blank during the blink period.
- kSLCDAltDisplay* Display alternate display during the blink period if duty cycle is lower than 5.

### 67.3.3.10 enum slcd\_blink\_rate\_t

Enumerator

- kSLCDBlinkRate00* SLCD blink rate is LCD clock/((2<sup>12</sup>))
- kSLCDBlinkRate01* SLCD blink rate is LCD clock/((2<sup>13</sup>))
- kSLCDBlinkRate02* SLCD blink rate is LCD clock/((2<sup>14</sup>))
- kSLCDBlinkRate03* SLCD blink rate is LCD clock/((2<sup>15</sup>))
- kSLCDBlinkRate04* SLCD blink rate is LCD clock/((2<sup>16</sup>))
- kSLCDBlinkRate05* SLCD blink rate is LCD clock/((2<sup>17</sup>))
- kSLCDBlinkRate06* SLCD blink rate is LCD clock/((2<sup>18</sup>))

*kSLCDBlinkRate07* SLCD blink rate is LCD clock/((2<sup>19</sup>))

### 67.3.3.11 enum slcd\_power\_supply\_option\_t

Enumerator

*kSLCDPowerReserved0* Unused right now.

*kSLCDPowerReserved1* Unused right now.

*kSLCDPowerInternalVll3AndChargePump* VLL3 connected to VDD internally and charge pump is used to generate VLL1 and VLL2.

*kSLCDPowerReserved2* Unused right now.

*kSLCDPowerExternalVll3AndResistorNetWork* VLL3 is driven externally and resistor bias network is used to generate VLL1 and VLL2.

*kSLCDPowerReserved3* Unused right now.

*kSLCDPowerExternalVll3AndChargePump* VLL3 is driven externally and charge pump is used to generate VLL1 and VLL2.

*kSLCDPowerVll1AndChargePump* VIREG is connected to VLL1 internally and charge pump is used to generate VLL2 and VLL3.

### 67.3.3.12 enum slcd\_fault\_detect\_clk\_prescaler\_t

Enumerator

*kSLCDFaultSampleFreq1BusClk* Fault detect sample clock frequency is 1/1 bus clock.

*kSLCDFaultSampleFreq1Div2BusClk* Fault detect sample clock frequency is 1/2 bus clock.

*kSLCDFaultSampleFreq1Div4BusClk* Fault detect sample clock frequency is 1/4 bus clock.

*kSLCDFaultSampleFreq1Div8BusClk* Fault detect sample clock frequency is 1/8 bus clock.

*kSLCDFaultSampleFreq1Div16BusClk* Fault detect sample clock frequency is 1/16 bus clock.

*kSLCDFaultSampleFreq1Div32BusClk* Fault detect sample clock frequency is 1/32 bus clock.

*kSLCDFaultSampleFreq1Div64BusClk* Fault detect sample clock frequency is 1/64 bus clock.

*kSLCDFaultSampleFreq1Div128BusClk* Fault detect sample clock frequency is 1/128 bus clock.

### 67.3.3.13 enum slcd\_fault\_detect\_sample\_win\_width\_t

Enumerator

*kSLCDFaultDetectWin Width4SampleClk* Sample window width is 4 sample clock cycles.

*kSLCDFaultDetectWin Width8SampleClk* Sample window width is 8 sample clock cycles.

*kSLCDFaultDetectWin Width16SampleClk* Sample window width is 16 sample clock cycles.

*kSLCDFaultDetectWin Width32SampleClk* Sample window width is 32 sample clock cycles.

*kSLCDFaultDetectWin Width64SampleClk* Sample window width is 64 sample clock cycles.

*kSLCDFaultDetectWin Width128SampleClk* Sample window width is 128 sample clock cycles.

*kSLCDFaultDetectWin Width256SampleClk* Sample window width is 256 sample clock cycles.

*kSLCDFaultDetectWin Width512SampleClk* Sample window width is 512 sample clock cycles.

## SLCD HAL driver

### 67.3.3.14 enum slcd\_int\_type\_t

Enumerator

*kSLCDFrameFreqInt* SLCD frame frequency interrupt is enabled or disabled.

*kSLCDFaultDetectionCompleteInt* SLCD fault detection complete interrupt is enabled or disabled.

*kSLCDEnableAllInt* SLCD both frame frequency and fault detection interrupts are enabled or disabled.

### 67.3.3.15 enum slcd\_status\_t

Enumerator

*kStatus\_SLCD\_Success* Succeed.

*kStatus\_SLCD\_NullArgument* Argument is NULL.

*kStatus\_SLCD\_Fail* SLCD failed.

## 67.3.4 Function Documentation

### 67.3.4.1 static void SLCD\_HAL\_Enable ( LCD\_Type \* *base* ) [inline], [static]

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address of SLCD peripheral instance. |
|-------------|-------------------------------------------|

### 67.3.4.2 static void SLCD\_HAL\_Disable ( LCD\_Type \* *base* ) [inline], [static]

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address of SLCD peripheral instance. |
|-------------|-------------------------------------------|

### 67.3.4.3 static void SLCD\_HAL\_SetDutyCyc ( LCD\_Type \* *base*, slcd\_duty\_cyc\_t *dutyCyc* ) [inline], [static]

Parameters

---

|                |                                           |
|----------------|-------------------------------------------|
| <i>base</i>    | Base address of SLCD peripheral instance. |
| <i>dutyCyc</i> | LCD duty cycle.                           |

**67.3.4.4 static void SLCD\_HAL\_SetBlinkCmd ( LCD\_Type \* *base*, bool *enable* )  
[inline], [static]**

Parameters

|               |                                           |
|---------------|-------------------------------------------|
| <i>base</i>   | Base address of SLCD peripheral instance. |
| <i>enable</i> | Enable/Disable SLCD blinking mode.        |

**67.3.4.5 static void SLCD\_HAL\_SetAltDisplayModeCmd ( LCD\_Type \* *base*, bool *enable* )  
[inline], [static]**

Parameters

|               |                                             |
|---------------|---------------------------------------------|
| <i>base</i>   | Base address of SLCD peripheral instance.   |
| <i>enable</i> | Enable/Disable SLCD alternate display mode. |

**67.3.4.6 static void SLCD\_HAL\_SetBlankDisplayModeCmd ( LCD\_Type \* *base*, bool *enable* )  
[inline], [static]**

Parameters

|               |                                           |
|---------------|-------------------------------------------|
| <i>base</i>   | Base address of SLCD peripheral instance. |
| <i>enable</i> | Enable/Disable SLCD blank mode.           |

**67.3.4.7 static void SLCD\_HAL\_SetFaultDetectCmd ( LCD\_Type \* *base*, bool *enable* )  
[inline], [static]**

Parameters

---

## SLCD HAL driver

|               |                                           |
|---------------|-------------------------------------------|
| <i>base</i>   | Base address of SLCD peripheral instance. |
| <i>enable</i> | Enable/Disable SLCD blank mode.           |

### 67.3.4.8 static bool SLCD\_HAL\_GetFaultDetectCompleteFlag ( LCD\_Type \* *base* ) [inline], [static]

This function indicates that the fault detection is completed.

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address of SLCD peripheral instance. |
|-------------|-------------------------------------------|

Returns

Fault detect complete flag state.

### 67.3.4.9 static void SLCD\_HAL\_ClearFaultDetectCompleteFlag ( LCD\_Type \* *base* ) [inline], [static]

This function clear fault detect complete flag.

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address of SLCD peripheral instance. |
|-------------|-------------------------------------------|

### 67.3.4.10 static uint32\_t SLCD\_HAL\_GetFaultDetectCounter ( LCD\_Type \* *base* ) [inline], [static]

Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address of SLCD peripheral instance. |
|-------------|-------------------------------------------|

Returns

Counter value.

### 67.3.4.11 static void SLCD\_HAL\_SetPinsEnableCmd ( LCD\_Type \* *base*, uint8\_t *highReg*, uint32\_t *data* ) [inline], [static]

## Parameters

|                |                                                      |
|----------------|------------------------------------------------------|
| <i>base</i>    | Base address of SLCD peripheral instance.            |
| <i>highReg</i> | 0 means low pin register, 1 means high pin register. |
| <i>data</i>    | SLCD pins enabled status.                            |

**67.3.4.12** `static void SLCD_HAL_SetBackPlanePinsEnableCmd ( LCD_Type * base,  
uint8_t highReg, uint32_t data ) [inline], [static]`

## Parameters

|                |                                                                            |
|----------------|----------------------------------------------------------------------------|
| <i>base</i>    | Base address of SLCD peripheral instance.                                  |
| <i>highReg</i> | 0 means low pin back panel register, 1 means high pin back panel register. |
| <i>data</i>    | ALL SLCD back plane enabled status.                                        |

**67.3.4.13** `static void SLCD_HAL_SetPinWaveForm ( LCD_Type * base, uint8_t pinIndex,  
uint8_t waveForm ) [inline], [static]`

## Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address of SLCD peripheral instance. |
| <i>pinIndex</i> | SLCD waveform number[0 63].               |
| <i>waveForm</i> | SLCD pin phase.                           |

**67.3.4.14** `static void SLCD_HAL_SetBackPlanePhase ( LCD_Type * base, uint8_t  
pinIndex, slcd_phase_index_t phase ) [inline], [static]`

## Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>base</i>     | Base address of SLCD peripheral instance. |
| <i>pinIndex</i> | SLCD waveform number[0 63].               |
| <i>phase</i>    | Configures SLCD back plane valid phase.   |

## SLCD HAL driver

**67.3.4.15** `static void SLCD_HAL_SetPinWaveFormPhaseCmd ( LCD_Type * base,  
uint8_t pinIndex, slcd_phase_index_t phaseIndex, bool enable ) [inline],  
[static]`

### Parameters

|                   |                                              |
|-------------------|----------------------------------------------|
| <i>base</i>       | Base address of SLCD peripheral instance.    |
| <i>pinIndex</i>   | SLCD waveform number[0 63].                  |
| <i>phaseIndex</i> | SLCD pin phase.                              |
| <i>enable</i>     | Enable/Disable the specific phase for a pin. |

**67.3.4.16** `void SLCD_HAL_VoltageAndPowerSupplyConfig ( LCD_Type * base,  
slcd_power_supply_option_t powerSupply, slcd_load_adjust_t loadAdjust,  
slcd_regulated_voltage_trim_t trim )`

### Parameters

|                    |                                           |
|--------------------|-------------------------------------------|
| <i>base</i>        | Base address of SLCD peripheral instance. |
| <i>powerSupply</i> | SLCD power supply configuration.          |
| <i>loadAdjust</i>  | SLCD load adjust configuration.           |
| <i>trim</i>        | the regulated voltage value.              |

**67.3.4.17** `void SLCD_HAL_ClockConfig ( LCD_Type * base, const slcd_clk_config_t *  
clkConfigPtr )`

### Parameters

|                     |                                           |
|---------------------|-------------------------------------------|
| <i>base</i>         | Base address of SLCD peripheral instance. |
| <i>clkConfigPtr</i> | SLCD clock and frame configuration.       |

**67.3.4.18** `void SLCD_HAL_BlinkingModeConfig ( LCD_Type * base, const  
slcd_blink_config_t * blinkConfigPtr )`

Parameters

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>base</i>           | Base address of SLCD peripheral instance.  |
| <i>blinkConfigPtr</i> | Pointer of configuring SLCD blinking mode. |

**67.3.4.19 void SLCD\_HAL\_FaultDetectionConfig ( LCD\_Type \* *base*, const slcd\_fault\_detect\_config\_t \* *faultDetectConfigPtr* )**

Parameters

|                              |                                           |
|------------------------------|-------------------------------------------|
| <i>base</i>                  | Base address of SLCD peripheral instance. |
| <i>faultDetect-ConfigPtr</i> | SLCD fault detection configuration.       |

**67.3.4.20 void SLCD\_HAL\_SetLowPowerModeConfig ( LCD\_Type \* *base*, const slcd\_work\_mode\_t \* *workMode* )**

Parameters

|                 |                                             |
|-----------------|---------------------------------------------|
| <i>base</i>     | Base address of SLCD peripheral instance.   |
| <i>workMode</i> | Configure SLCD work mode in doze/stop mode. |

**67.3.4.21 void SLCD\_HAL\_SetIntCmd ( LCD\_Type \* *base*, slcd\_int\_type\_t *intType*, bool *enable* )**

Parameters

|                |                                           |
|----------------|-------------------------------------------|
| <i>base</i>    | Base address of SLCD peripheral instance. |
| <i>intType</i> | SLCD interrupt Configuration.             |
| <i>enable</i>  | Enable or Disable interrupt.              |

**67.3.4.22 void SLCD\_HAL\_Init ( LCD\_Type \* *base* )**

## SLCD HAL driver

### Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | Base address of SLCD peripheral instance. |
|-------------|-------------------------------------------|

## Chapter 68 Smart Card

### 68.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the UART-ISO7816 and EMVSIM modules of Kinetis devices which are wraps into Smart Card driver.

Smart Card driver covers all necessary functions to access and control integrated circuit cards. The driver controls communication modules (UART/EMVSIM) and also handles special ICC sequences, such as the activation/deactivation (using EMVSIM IP or external interface chip). The Smart Card driver consist of two IPs (SmartCard\_Uart and SmartCard\_EmvSim drivers) and two PHY drivers (SmartCard\_interface\_direct and SmartCard\_interface\_ncn8025 drivers). These drivers can be combined with each other, which means that Smart Card driver wraps one IP (transmission) and one PHY (interface) driver.

### Modules

- [EMVSIM HAL driver](#)
- [Smart Card driver](#)
- [UART HAL driver](#)

---

## Overview

### 68.1.1 Smart Card EMV SIM Driver

The SmartCard EMV SIM driver covers the transmission functionality in CPU and DMA mode. The driver also supports blocking (synchronous) and non-blocking (asynchronous) types of data transfers.

## 68.2 EMVSIM HAL driver

### 68.2.1 Overview

This section describes the programming interface of the EMVSIM HAL driver.

 kEmvsimPDPinIsHigh = 1U }
 EMVSIM card presence detection status.
• enum emvsim_card_clock_stop_polarity_t {
 kEmvsimCardClockStopPolarityIsLow = 0U,
 kEmvsimCardClockStopPolarityIsHigh = 1U }
 EMVSIM card clock polarity control when card clock is disabled.
• enum emvsim_reset_card_t {
 kEmvsimResetAssert = 0U,
 kEmvsimResetDeassert = 1U }
 EMVSIM card reset control.
• enum emvsim_vcc_en_polarity_t {
 kEmvsimVccEnIsHigh = 0U,
 kEmvsimVccEnIsLow = 1U }
 EMVSIM card voltage enable signal polarity control.

```

## EMVSIM HAL driver

### EMVSIM Common Configurations

- void [EMVSIM\\_HAL\\_Init](#) (EMVSIM\_Type \*base)  
*Initializes the EMVSIM controller.*
- uint32\_t [EMVSIM\\_HAL\\_GetModuleParameter](#) (EMVSIM\_Type \*base, [emvsim\\_module\\_param\\_t](#) param)  
*Returns the EMVSIM controller version, transmit and receive FIFO sizes.*
- static uint8\_t [EMVSIM\\_HAL\\_GetTxFifoSize](#) (EMVSIM\_Type \*base)  
*Returns the EMVSIM controller transmit FIFO size.*
- static uint8\_t [EMVSIM\\_HAL\\_GetRxFifoSize](#) (EMVSIM\_Type \*base)  
*Returns the EMVSIM controller receive FIFO size.*
- void [EMVSIM\\_HAL\\_SetGPCClockSelect](#) (EMVSIM\_Type \*base, uint8\_t gpcNumber, [emvsim\\_gpc\\_clock\\_select\\_t](#) gpcClockSel)  
*Selects the EMVSIM general purpose counter clock.*
- static void [EMVSIM\\_HAL\\_SetClockPrescaler](#) (EMVSIM\_Type \*base, uint8\_t prescaler)  
*Sets the clock prescaler for the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetBaudrateDivisor](#) (EMVSIM\_Type \*base, uint16\_t divisor)  
*Sets the baudrate divisor for the EMVSIM controller.*
- void [EMVSIM\\_HAL\\_SetControl](#) (EMVSIM\_Type \*base, [emvsim\\_control\\_t](#) control, bool enable)  
*Enables/disables different control functions of the EMVSIM controller.*
- bool [EMVSIM\\_HAL\\_GetControl](#) (EMVSIM\_Type \*base, [emvsim\\_control\\_t](#) control)  
*Returns the current state of different control functions of the EMVSIM controller.*
- void [EMVSIM\\_HAL\\_SetIntMode](#) (EMVSIM\_Type \*base, [emvsim\\_interrupt\\_t](#) interrupt, bool enable)  
*Enables/disables the EMVSIM controller interrupt reasons to raise an interrupt.*
- bool [EMVSIM\\_HAL\\_GetIntMode](#) (EMVSIM\_Type \*base, [emvsim\\_interrupt\\_t](#) interrupt)  
*Returns whether different interrupt reasons are masked or unmasked in the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetReceiverNackThreshold](#) (EMVSIM\_Type \*base, uint8\_t rnaack-Threshold)  
*Sets the receiver NACK threshold value of the EMVSIM controller.*
- static uint8\_t [EMVSIM\\_HAL\\_GetReceiverNackThreshold](#) (EMVSIM\_Type \*base)  
*Returns the receiver NACK threshold value of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetReceiverDataThreshold](#) (EMVSIM\_Type \*base, uint8\_t rdt)  
*Sets the receiver data threshold value of the EMVSIM controller.*
- static uint8\_t [EMVSIM\\_HAL\\_GetReceiverDataThreshold](#) (EMVSIM\_Type \*base)  
*Returns the receiver data threshold value of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetTransmitterNackThreshold](#) (EMVSIM\_Type \*base, uint8\_t tnaack-Threshold)  
*Sets the transmitter NACK threshold value of the EMVSIM controller.*
- static uint8\_t [EMVSIM\\_HAL\\_GetTransmitterNackThreshold](#) (EMVSIM\_Type \*base)  
*Returns the transmitter NACK threshold value of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetTransmitterDataThreshold](#) (EMVSIM\_Type \*base, uint8\_t tdt)  
*Sets the transmitter data threshold value of the EMVSIM controller.*
- static uint8\_t [EMVSIM\\_HAL\\_GetTransmitterDataThreshold](#) (EMVSIM\_Type \*base)  
*Returns the transmitter data threshold value of EMVSIM controller.*
- static bool [EMVSIM\\_HAL\\_IsReceiveFifoEmpty](#) (EMVSIM\_Type \*base)  
*Returns the state of the received FIFO (either empty or has bytes to read from EMVSIM controller).*
- static bool [EMVSIM\\_HAL\\_IsTransmitFifoFull](#) (EMVSIM\_Type \*base)  
*Returns the state of the transmitted FIFO (either full or bytes can be written into the transmit FIFO of the EMVSIM controller).*

- bool [EMVSIM\\_HAL\\_GetReceiveStatus](#) (EMVSIM\_Type \*base, [emvsim\\_rx\\_status\\_t](#) rxStatus)  
*Returns the receive status of the EMVSIM controller.*
- void [EMVSIM\\_HAL\\_ClearReceiveStatus](#) (EMVSIM\_Type \*base, [emvsim\\_rx\\_status\\_t](#) rxStatus)  
*Clears the receive status of the EMVSIM controller.*
- bool [EMVSIM\\_HAL\\_GetTransmitStatus](#) (EMVSIM\_Type \*base, [emvsim\\_tx\\_status\\_t](#) txStatus)  
*Returns the transmit status of the EMVSIM controller.*
- void [EMVSIM\\_HAL\\_ClearTransmitStatus](#) (EMVSIM\_Type \*base, [emvsim\\_tx\\_status\\_t](#) txStatus)  
*Clears the transmit status of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetCardPresenceDetectEdge](#) (EMVSIM\_Type \*base, [emvsim\\_presence\\_detect\\_edge\\_t](#) spdes)  
*Sets the card presence detection edge of the EMVSIM controller.*
- static [emvsim\\_presence\\_detect\\_edge\\_t](#) [EMVSIM\\_HAL\\_GetCardPresenceDetectEdge](#) (EMVSIM\_Type \*base)  
*Returns the current setting of the card presence detection edge of the EMVSIM controller.*
- static [emvsim\\_presence\\_detect\\_status\\_t](#) [EMVSIM\\_HAL\\_GetCardPresenceDetectPinStatus](#) (EMVSIM\_Type \*base)  
*Returns the card presence detection pin level of the EMVSIM controller.*
- static bool [EMVSIM\\_HAL\\_GetCardPresenceDetectInterruptStatus](#) (EMVSIM\_Type \*base)  
*Returns the card presence detection interrupt status of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_ClearCardPresenceDetectInterruptStatus](#) (EMVSIM\_Type \*base)  
*Clears the card presence detection interrupt status of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetAutoPowerDown](#) (EMVSIM\_Type \*base, bool spd)  
*Enables/disables the auto power down of the EMVSIM controller.*
- static bool [EMVSIM\\_HAL\\_GetAutoPowerDown](#) (EMVSIM\_Type \*base)  
*Returns whether the state of auto power down of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetCardClockStopPolarity](#) (EMVSIM\_Type \*base, [emvsim\\_card\\_clock\\_stop\\_polarity\\_t](#) scsp)  
*Sets the clock signal polarity during clock stop of EMVSIM controller.*
- static [emvsim\\_card\\_clock\\_stop\\_polarity\\_t](#) [EMVSIM\\_HAL\\_GetCardClockStopPolarity](#) (EMVSIM\_Type \*base)  
*Returns the current setting of the clock signal polarity during the clock stop of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_EnableCardClock](#) (EMVSIM\_Type \*base)  
*Enables the card clock from the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_DisableCardClock](#) (EMVSIM\_Type \*base)  
*Disables the card clock from the EMVSIM controller.*
- static bool [EMVSIM\\_HAL\\_IsCardClockEnabled](#) (EMVSIM\_Type \*base)  
*Returns the current setting of the card clock from the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_ResetCard](#) (EMVSIM\_Type \*base, [emvsim\\_reset\\_card\\_t](#) srst)  
*Asserts/de-asserts the card reset signal from the EMVSIM controller.*
- static [emvsim\\_reset\\_card\\_t](#) [EMVSIM\\_HAL\\_GetCardResetState](#) (EMVSIM\_Type \*base)  
*Returns whether the card reset signal has been asserted from the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetCardVCCEnablePolarity](#) (EMVSIM\_Type \*base, [emvsim\\_vcc\\_enable\\_polarity\\_t](#) vccenp)  
*Sets the polarity of the VCC enable signal from the EMVSIM controller.*
- static [emvsim\\_vcc\\_enable\\_polarity\\_t](#) [EMVSIM\\_HAL\\_GetCardVCCEnablePolarity](#) (EMVSIM\_Type \*base)  
*Returns the polarity of the VCC enable signal from the EMVSIM controller.*

## EMVSIM HAL driver

- static void [EMVSIM\\_HAL\\_SetVCCEnable](#) (EMVSIM\_Type \*base, bool svccEnable)  
*Controls the state of the VCC enable signal from the EMVSIM controller.*
- static bool [EMVSIM\\_HAL\\_GetVCCEnable](#) (EMVSIM\_Type \*base)  
*Returns the state of the VCC enable signal from the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_EnableAutoPowerDown](#) (EMVSIM\_Type \*base)  
*Enables the auto power down feature of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_DisableAutoPowerDown](#) (EMVSIM\_Type \*base)  
*Disables the auto power down feature of the EMVSIM controller.*
- static bool [EMVSIM\\_HAL\\_IsAutoPowerDownEnabled](#) (EMVSIM\_Type \*base)  
*Returns the current state of the auto power down feature of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_GetChar](#) (EMVSIM\_Type \*base, uint8\_t \*readData)  
*Reads the received data byte from the EMVSIM controller.*
- static uint32\_t [EMVSIM\\_HAL\\_GetRxDataRegAddr](#) (EMVSIM\_Type \*base)  
*Returns the address of the receive data byte register of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_PutChar](#) (EMVSIM\_Type \*base, uint8\_t writeData)  
*Writes a byte data to the transmit data byte of the EMVSIM controller.*
- static uint32\_t [EMVSIM\\_HAL\\_GetTxDataRegAddr](#) (EMVSIM\_Type \*base)  
*Returns the address of the transmit data byte register of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetAdditionalTransmitterGuardTime](#) (EMVSIM\_Type \*base, uint8\_t getu)  
*Sets an additional transmitter guard time value of the EMVSIM controller.*
- static uint8\_t [EMVSIM\\_HAL\\_GetAdditionalTransmitterGuardTime](#) (EMVSIM\_Type \*base)  
*Returns the current setting of the additional transmitter guard time value of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetCharacterWaitTime](#) (EMVSIM\_Type \*base, uint16\_t cwt)  
*Sets the character wait time value of the EMVSIM controller.*
- static uint16\_t [EMVSIM\\_HAL\\_GetCharacterWaitTime](#) (EMVSIM\_Type \*base)  
*Returns the character wait time value of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetBlockWaitTime](#) (EMVSIM\_Type \*base, uint32\_t bwt)  
*Sets the block wait time value of the EMVSIM controller.*
- static uint32\_t [EMVSIM\\_HAL\\_GetBlockWaitTime](#) (EMVSIM\_Type \*base)  
*Returns the block wait time value of the EMVSIM controller.*
- static void [EMVSIM\\_HAL\\_SetBlockGuardTime](#) (EMVSIM\_Type \*base, uint16\_t bgt)  
*Sets the block guard time value of the EMVSIM controller.*
- static uint16\_t [EMVSIM\\_HAL\\_GetBlockGuardTime](#) (EMVSIM\_Type \*base)  
*Returns the block guard time value of the EMVSIM controller.*
- void [EMVSIM\\_HAL\\_SetGPCNTValue](#) (EMVSIM\_Type \*base, uint8\_t gpcntIndex, uint16\_t gpcntVal)  
*Sets the timeout value of the general purpose counters of the EMVSIM controller.*
- uint16\_t [EMVSIM\\_HAL\\_GetGPCNTValue](#) (EMVSIM\_Type \*base, uint8\_t gpcntIndex)  
*Returns the timeout value of the general purpose counters of the EMVSIM controller.*

## 68.2.2 Enumeration Type Documentation

### 68.2.2.1 enum emvsim\_module\_param\_t

Enumerator

- kEmvsimParamVersion* Module version.
- kEmvsimParamTxFifoSize* Transmit FIFO size.

*kEmvsimParamRxFifoSize* Receive FIFO size.

### 68.2.2.2 enum emvsim\_gpc\_clock\_select\_t

Enumerator

*kEmvsimGPCClockDisable* Disabled.  
*kEmvsimGPCCardClock* Card clock.  
*kEmvsimGPCRxClock* Receive clock.  
*kEmvsimGPCTxClock* Transmit ETU clock.

### 68.2.2.3 enum emvsim\_crc\_flip\_control\_t

Enumerator

*kEmvsimCrcNoFlip* Bits are not reversed.  
*kEmvsimCrcFlip* Bits are reversed.

### 68.2.2.4 enum emvsim\_crc\_inv\_control\_t

Enumerator

*kEmvsimCrcNoInv* Bits are not inverted.  
*kEmvsimCrcInv* Bits are inverted.

### 68.2.2.5 enum emvsim\_stop\_clock\_control\_t

Enumerator

*kEmvsimStopDownAllClocks* Shut down all clocks.  
*kEmvsimStopDownAllButCardClock* Shut down all but card clock.

### 68.2.2.6 enum emvsim\_doze\_clock\_control\_t

Enumerator

*kEmvsimDozeDownAllClocks* Shut down all clocks.  
*kEmvsimDozeDownNoClocks* Don't shut down clocks.

## EMVSIM HAL driver

### 68.2.2.7 enum emvsim\_data\_convention\_t

Enumerator

- kEmvsimDirectConvention* Direct convention.
- kEmvsimInverseConvention* Inverse convention.

### 68.2.2.8 enum emvsim\_character\_mode\_t

Enumerator

- kEmvsimCharacter12EtuMode* 12 ETU character mode
- kEmvsimCharacter11EtuMode* 11 ETU character mode

### 68.2.2.9 enum emvsim\_control\_t

Enumerator

- kEmvsimCtrlInverseConvention* Select direct or inverse convention.
- kEmvsimCtrlInitialCharacterMode* Enable/disable initial character detection.
- kEmvsimCtrlANACKEnable* Enable/disable Auto NACK function.
- kEmvsimCtrlONACKEnable* Enable/disable NACK on Overflow function.
- kEmvsimCtrlFlushRx* Reset receiver or in normal operation.
- kEmvsimCtrlFlushTx* Reset transmitter or in normal operation.
- kEmvsimCtrlSwRst* Reset EMVSIM or in normal operation.
- kEmvsimCtrlKillClocks* Enable/disable EMVSIM input clock.
- kEmvsimCtrlDozeEnable* Enable/disable DOZE instruction effect on clocks.
- kEmvsimCtrlStopEnable* Enable/disable STOP instruction effect on clocks.
- kEmvsimCtrlReceiverEnable* Enable/disable receiver.
- kEmvsimCtrlTransmitterEnable* Enable/disable transmitter.
- kEmvsimCtrlRcvr11ModeEnable* Configure receiver in 12 or 11 etu mode.
- kEmvsimCtrlRxDmaEnable* Enable/disable receiver DMA.
- kEmvsimCtrlTxDmaEnable* Enable/disable transmitter DMA.
- kEmvsimCtrlInvertCrcOutput* Controls CRC output to be inverted or not.
- kEmvsimCtrlFlipCrcOutput* Controls CRC output to be flipped or not.
- kEmvsimCtrlFlipCrcInput* Controls CRC input to be flipped or not.
- kEmvsimCtrlCWTEnable* Enable/disable CWT timer.
- kEmvsimCtrlLrcEnable* Enable/disable LRC operation.
- kEmvsimCtrlCrcEnable* Enable/disable CRC operation.
- kEmvsimCtrlXmtCrcOrLrcEnable* Enable/disable CRC or LRC operation in transmission.
- kEmvsimCtrlBWTEnable* Enable/disable BWT timer.

### 68.2.2.10 enum emvsim\_interrupt\_t

Enumerator

- kEmvsimIntRxData* Receive data interrupt.
- kEmvsimIntGPCnt1* General purpose counter 1 timeout interrupt.
- kEmvsimIntBGTErr* Block guard time error interrupt.
- kEmvsimIntBWTErr* Block wait time error interrupt.
- kEmvsimIntRxNackThreshold* Receiver NACK threshold interrupt.
- kEmvsimIntCWTErr* Character wait time error interrupt.
- kEmvsimIntGPCnt0* General purpose counter 0 timeout interrupt.
- kEmvsimIntTxDataThreshold* Transmit data threshold interrupt.
- kEmvsimIntTxFIFOFull* Transmit FIFO full interrupt.
- kEmvsimIntTxNackThresold* Transmit NACK threshold interrupt.
- kEmvsimIntTxFIFOEmpty* Transmit FIFO empty interrupt.
- kEmvsimIntEarlyTxComplete* Early transmit complete interrupt.
- kEmvsimIntRxFIFOOverflow* Receive FIFO overflow interrupt.
- kEmvsimIntTxComplete* Transmit complete interrupt.
- kEmvsimIntRxDataThreshold* Receive data threshold interrupt.
- kEmvsimIntPresenceDetect* Card presence detect interrupt.

### 68.2.2.11 enum emvsim\_rx\_status\_t

Enumerator

- kEmvsimFrameErr* Frame error flag.
- kEmvsimParityErr* Parity error flag.
- kEmvsimBGTErr* Block guard time error flag.
- kEmvsimBWTErr* Block wait time error flag.
- kEmvsimRxNackThresholdErr* Received NACK threshold error flag.
- kEmvsimCWTErr* Character wait time error flag.
- kEmvsimCRCCheckOk* CRC check OK flag.
- kEmvsimLRCCheckOk* LRC check OK flag.
- kEmvsimRxDataThreshold* Received data threshold interrupt flag.
- kEmvsimRxData* Receive data interrupt flag.
- kEmvsimRxDataOverflow* Receive data overflow flag.
- kEmvsimRxAllStatus* All receive status flags.

### 68.2.2.12 enum emvsim\_tx\_status\_t

Enumerator

- kEmvsimGPCNT1Timeout* General purpose counter 1 timeout flag.
- kEmvsimGPCNT0Timeout* General purpose counter 0 timeout flag.

## EMVSIM HAL driver

*kEmvsimTxDataThreshold* Transmit data threshold flag.  
*kEmvsimTxFIFOFull* Transmit FIFO full flag.  
*kEmvsimTxComplete* Transmit complete flag.  
*kEmvsimEarlyTxComplete* Early transmit complete flag.  
*kEmvsimTxFIFOEmpty* Transmit FIFO empty flag.  
*kEmvsimTxNackThresholdErr* Transmit NACK threshold error flag.  
*kEmvsimTxAllStatus* All transmit status flags.

### 68.2.2.13 enum emvsim\_presence\_detect\_edge\_t

Enumerator

*kEmvsimPDOnFallingEdge* Presence detected on falling edge.  
*kEmvsimPDOnRisingEdge* Presence detected on rising edge.

### 68.2.2.14 enum emvsim\_presence\_detect\_status\_t

Enumerator

*kEmvsimPDPinIsLow* Presence detected pin is logic low.  
*kEmvsimPDPinIsHigh* Presence detected pin is logic high.

### 68.2.2.15 enum emvsim\_card\_clock\_stop\_polarity\_t

Enumerator

*kEmvsimCardClockStopPolarityIsLow* Card clock stop polarity is logic low.  
*kEmvsimCardClockStopPolarityIsHigh* Card clock stop polarity is logic high.

### 68.2.2.16 enum emvsim\_reset\_card\_t

Enumerator

*kEmvsimResetAssert* Smart card reset is assert.  
*kEmvsimResetDeassert* Smart card reset de-assert.

### 68.2.2.17 enum emvsim\_vcc\_en\_polarity\_t

Enumerator

*kEmvsimVccEnIsHigh* VCC\_EN polarity is active high.  
*kEmvsimVccEnIsLow* VCC\_EN polarity is active low.

## 68.2.3 Function Documentation

### 68.2.3.1 void EMVSIM\_HAL\_Init ( EMVSIM\_Type \* *base* )

This function initializes the module to a known state.

## EMVSIM HAL driver

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

### 68.2.3.2 `uint32_t EMVSIM_HAL_GetModuleParameter ( EMVSIM_Type * base, emvsim_module_param_t param )`

This function returns the EMVSIM controller version and transmit and receive FIFO sizes.

Parameters

|              |                             |
|--------------|-----------------------------|
| <i>base</i>  | EMVSIM module base pointer. |
| <i>param</i> | Parameter type.             |

Returns

Version number, transmit or receive FIFO sizes.

### 68.2.3.3 `static uint8_t EMVSIM_HAL_GetTxFifoSize ( EMVSIM_Type * base ) [inline], [static]`

This function returns the EMVSIM transmit FIFO size.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Transmit FIFO size.

### 68.2.3.4 `static uint8_t EMVSIM_HAL_GetRxFifoSize ( EMVSIM_Type * base ) [inline], [static]`

This function returns the EMVSIM receive FIFO size.

Parameters

---

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Receive FIFO size.

### 68.2.3.5 void EMVSIM\_HAL\_SetGPCClockSelect ( EMVSIM\_Type \* *base*, uint8\_t *gpcNumber*, emvsim\_gpc\_clock\_select\_t *gpcClockSel* )

This function selects the clock for the general purpose counters.

Parameters

|                    |                                 |
|--------------------|---------------------------------|
| <i>base</i>        | EMVSIM module base pointer.     |
| <i>gpcNumber</i>   | General purpose counter number. |
| <i>gpcClockSel</i> | Clock selection input.          |

### 68.2.3.6 static void EMVSIM\_HAL\_SetClockPrescaler ( EMVSIM\_Type \* *base*, uint8\_t *prescaler* ) [inline], [static]

This function sets the clock prescaler value of the EMVSIM controller.

Parameters

|                  |                             |
|------------------|-----------------------------|
| <i>base</i>      | EMVSIM module base pointer. |
| <i>prescaler</i> | Clock prescaler value.      |

### 68.2.3.7 static void EMVSIM\_HAL\_SetBaudrateDivisor ( EMVSIM\_Type \* *base*, uint16\_t *divisor* ) [inline], [static]

This function sets the baudrate divisor value of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

## EMVSIM HAL driver

|                |                         |
|----------------|-------------------------|
| <i>divisor</i> | Baudrate divisor value. |
|----------------|-------------------------|

### 68.2.3.8 void EMVSIM\_HAL\_SetControl ( EMVSIM\_Type \* *base*, emvsim\_control\_t *control*, bool *enable* )

This function enables/disables different control functions of the EMVSIM controller.

Parameters

|                |                                                    |
|----------------|----------------------------------------------------|
| <i>base</i>    | EMVSIM module base pointer.                        |
| <i>control</i> | Control functions as described in emvsim_control_t |
| <i>enable</i>  | Enable/disable control function                    |

### 68.2.3.9 bool EMVSIM\_HAL\_GetControl ( EMVSIM\_Type \* *base*, emvsim\_control\_t *control* )

This function returns the current state of different control functions of the EMVSIM controller.

Parameters

|                |                                                    |
|----------------|----------------------------------------------------|
| <i>base</i>    | EMVSIM module base pointer.                        |
| <i>control</i> | Control functions as described in emvsim_control_t |

Returns

true - The control function is enabled  
false - The control function is disabled

### 68.2.3.10 void EMVSIM\_HAL\_SetIntMode ( EMVSIM\_Type \* *base*, emvsim\_interrupt\_t *interrupt*, bool *enable* )

This function enables/disables the different interrupt reasons of the EMVSIM controller to raise an interrupt.

Parameters

---

|                  |                                                                   |
|------------------|-------------------------------------------------------------------|
| <i>base</i>      | EMVSIM module base pointer.                                       |
| <i>interrupt</i> | - interrupt reasons                                               |
| <i>enable</i>    | true - enable interrupt (unmask) false - disable interrupt (mask) |

**68.2.3.11 bool EMVSIM\_HAL\_GetIntMode ( EMVSIM\_Type \* *base*, emvsim\_interrupt\_t *interrupt* )**

This function returns whether different interrupt masks are enabled/disabled for different interrupt reasons of the EMVSIM controller.

Parameters

|                  |                             |
|------------------|-----------------------------|
| <i>base</i>      | EMVSIM module base pointer. |
| <i>interrupt</i> | - interrupt reasons         |

Returns

true - interrupt enabled (unmasked) false - interrupt disabled (masked)

**68.2.3.12 static void EMVSIM\_HAL\_SetReceiverNackThreshold ( EMVSIM\_Type \* *base*, uint8\_t *rackThreshold* ) [inline], [static]**

This function sets a value for the receiver NACK threshold in the EMVSIM controller.

Parameters

|                      |                               |
|----------------------|-------------------------------|
| <i>base</i>          | EMVSIM module base pointer.   |
| <i>rackThreshold</i> | Receiver NACK threshold value |

**68.2.3.13 static uint8\_t EMVSIM\_HAL\_GetReceiverNackThreshold ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the value for the receiver NACK threshold in the EMVSIM controller.

Parameters

---

## EMVSIM HAL driver

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Receiver NACK threshold value

**68.2.3.14 static void EMVSIM\_HAL\_SetReceiverDataThreshold ( EMVSIM\_Type \* *base*, uint8\_t *rdt* ) [inline], [static]**

This function sets a value for the receiver data threshold value in the EMVSIM controller, i.e., the number of bytes that must exist in the receive FIFO to trigger the corresponding interrupt flag.

Parameters

|             |                               |
|-------------|-------------------------------|
| <i>base</i> | EMVSIM module base pointer.   |
| <i>rdt</i>  | Receiver data threshold value |

**68.2.3.15 static uint8\_t EMVSIM\_HAL\_GetReceiverDataThreshold ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the value for the receiver data threshold value in the EMVSIM controller, i.e., the number of bytes that must exist in the receive FIFO to trigger the corresponding interrupt flag.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Receiver data threshold value

**68.2.3.16 static void EMVSIM\_HAL\_SetTransmitterNackThreshold ( EMVSIM\_Type \* *base*, uint8\_t *tnackThreshold* ) [inline], [static]**

This function sets a value for the transmitter NACK threshold value in the EMVSIM controller.

Parameters

|                       |                                  |
|-----------------------|----------------------------------|
| <i>base</i>           | EMVSIM module base pointer.      |
| <i>tnackThreshold</i> | Transmitter NACK threshold value |

**68.2.3.17 static uint8\_t EMVSIM\_HAL\_GetTransmitterNackThreshold ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the value for the transmitter NACK threshold value in the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Transmitter NACK threshold value

**68.2.3.18 static void EMVSIM\_HAL\_SetTransmitterDataThreshold ( EMVSIM\_Type \* *base*, uint8\_t *tdt* ) [inline], [static]**

This function sets a value for the transmitter data threshold value in the EMVSIM controller, i.e., the the threshold value for the transmit FIFO at which the corresponding interrupt flag is set.

Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | EMVSIM module base pointer.      |
| <i>tdt</i>  | Transmitter data threshold value |

**68.2.3.19 static uint8\_t EMVSIM\_HAL\_GetTransmitterDataThreshold ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the value for transmitter data threshold value in the EMVSIM controller.

Parameters

---

## EMVSIM HAL driver

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Transmitter data threshold value

### 68.2.3.20 **static bool EMVSIM\_HAL\_IsReceiveFifoEmpty ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function the state of receive FIFO (either empty or has bytes to read from the EMVSIM controller).

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

true - Receive FIFO is empty false - Receive FIFO has bytes to read.

### 68.2.3.21 **static bool EMVSIM\_HAL\_IsTransmitFifoFull ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the state of the transmitted FIFO (either full or bytes can be written into the transmit FIFO of the EMVSIM controller).

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

true - Transmit FIFO is full false - Data bytes can be written into transmit FIFO

### 68.2.3.22 **bool EMVSIM\_HAL\_GetReceiveStatus ( EMVSIM\_Type \* *base*, emvsim\_rx\_status\_t *rxStatus* )**

This function returns the receive status of the EMVSIM controller.

Parameters

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>base</i>     | EMVSIM module base pointer.                                  |
| <i>rxStatus</i> | Indicates a particular receive status information to return. |

Returns

true - Indicate the particular receive status is set, false - Indicate the particular receive status is clear

**68.2.3.23 void EMVSIM\_HAL\_ClearReceiveStatus ( EMVSIM\_Type \* *base*, emvsim\_rx\_status\_t *rxStatus* )**

This function clears the receive status of the EMVSIM controller.

Parameters

|                 |                                                 |
|-----------------|-------------------------------------------------|
| <i>base</i>     | EMVSIM module base pointer.                     |
| <i>rxStatus</i> | Indicates a particular receive status to clear. |

**68.2.3.24 bool EMVSIM\_HAL\_GetTransmitStatus ( EMVSIM\_Type \* *base*, emvsim\_tx\_status\_t *txStatus* )**

This function returns the transmit status of the EMVSIM controller.

Parameters

|                 |                                                               |
|-----------------|---------------------------------------------------------------|
| <i>base</i>     | EMVSIM module base pointer.                                   |
| <i>txStatus</i> | Indicates a particular transmit status information to return. |

Returns

true - Indicate the particular transmit status is set, false - Indicate the particular transmit status is clear

**68.2.3.25 void EMVSIM\_HAL\_ClearTransmitStatus ( EMVSIM\_Type \* *base*, emvsim\_tx\_status\_t *txStatus* )**

This function clears the transmit status of the EMVSIM controller.

## EMVSIM HAL driver

### Parameters

|                 |                                                  |
|-----------------|--------------------------------------------------|
| <i>base</i>     | EMVSIM module base pointer.                      |
| <i>txStatus</i> | Indicates a particular transmit status to clear. |

**68.2.3.26 static void EMVSIM\_HAL\_SetCardPresenceDetectEdge ( EMVSIM\_Type \* *base*, emvsim\_presence\_detect\_edge\_t *spdes* ) [inline], [static]**

This function sets the card presence detection edge of the EMVSIM controller.

### Parameters

|              |                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>  | EMVSIM module base pointer.                                                                                            |
| <i>spdes</i> | kEmvsimPDOnFallingEdge - presence detection on falling edge, kEmvsimPDOnRisingEdge - presence detection on rising edge |

**68.2.3.27 static emvsim\_presence\_detect\_edge\_t EMVSIM\_HAL\_GetCardPresenceDetectEdge ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the current setting of the card presence detection edge of the EMVSIM controller.

### Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

### Returns

kEmvsimPDOnFallingEdge - presence detection on falling edge, kEmvsimPDOnRisingEdge - presence detection on rising edge

**68.2.3.28 static emvsim\_presence\_detect\_status\_t EMVSIM\_HAL\_GetCardPresenceDetectPinStatus ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the card presence detection pin level of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

kEmvsimPDPinIsLow - presence detection pin level is LOW, kEmvsimPDPinIsHigh - presence detection pin level is HIGH

**68.2.3.29 static bool EMVSIM\_HAL\_GetCardPresenceDetectInterruptStatus ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the card presence detection interrupt status of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

true - card presence has been detected, false - card presence has not been detected

**68.2.3.30 static void EMVSIM\_HAL\_ClearCardPresenceDetectInterruptStatus ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function clears the card presence detection interrupt status of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

**68.2.3.31 static void EMVSIM\_HAL\_SetAutoPowerDown ( EMVSIM\_Type \* *base*, bool *spd* ) [inline], [static]**

This function enables/disables the auto power down of the EMVSIM controller.

Parameters

---

## EMVSIM HAL driver

|             |                                                  |
|-------------|--------------------------------------------------|
| <i>base</i> | EMVSIM module base pointer.                      |
| <i>spd</i>  | true - Start auto power down, false - No effect. |

### 68.2.3.32 **static bool EMVSIM\_HAL\_GetAutoPowerDown ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the state of auto power down of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

true - Auto power down has been started or in progress, false - Auto power down is not activated.

### 68.2.3.33 **static void EMVSIM\_HAL\_SetCardClockStopPolarity ( EMVSIM\_Type \* *base*, emvsim\_card\_clock\_stop\_polarity\_t *scsp* ) [inline], [static]**

This function sets clock signal polarity during clock stop of EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

*scsp* kEmvsimCardClockStopPolarityIsLow - clock stop polarity is LOW, kEmvsimCardClockStopPolarityIsHigh - clock stop polarity is HIGH.

### 68.2.3.34 **static emvsim\_card\_clock\_stop\_polarity\_t EMVSIM\_HAL\_GetCardClockStopPolarity ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the current setting of the clock signal polarity during the clock stop of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

kEmvsimCardClockStopPolarityIsLow - clock stop polarity is LOW, kEmvsimCardClockStopPolarityIsHigh - clock stop polarity is HIGH.

**68.2.3.35 static void EMVSIM\_HAL\_EnableCardClock ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function enables the card clock from the the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

**68.2.3.36 static void EMVSIM\_HAL\_DisableCardClock ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function disables the card clock from the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

**68.2.3.37 static bool EMVSIM\_HAL\_IsCardClockEnabled ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function returns the current setting of the card clock from the EMVSIM controller, whether it is enabled or disabled.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

true - Card clock is enabled, false - Card clock is disabled.

---

**EMVSIM HAL driver**

**68.2.3.38** `static void EMVSIM_HAL_ResetCard ( EMVSIM_Type * base,  
emvsim_reset_card_t rsst ) [inline], [static]`

This function asserts/de-asserts the card reset signal from the EMVSIM controller.

## Parameters

|             |                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------|
| <i>base</i> | EMVSIM module base pointer.                                                                                    |
| <i>srst</i> | - kEmvsimResetAssert - Card reset signal is asserted, kEmvsimResetDeassert - Card reset signal is de-asserted. |

**68.2.3.39 static emvsim\_reset\_card\_t EMVSIM\_HAL\_GetCardResetState ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns whether the card reset signal has been asserted/de-asserted from the EMVSIM controller.

## Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

## Returns

kEmvsimResetAssert - Card reset signal is asserted, kEmvsimResetDeassert - Card reset signal is de-asserted.

**68.2.3.40 static void EMVSIM\_HAL\_SetCardVCCEnablePolarity ( EMVSIM\_Type \* *base*, emvsim\_vcc\_en\_polarity\_t *vccenp* ) [inline], [static]**

This function sets the polarity of the VCC enable signal from the EMVSIM controller.

## Parameters

|               |                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | EMVSIM module base pointer.                                                                                           |
| <i>vccenp</i> | - kEmvsimVccEnIsHigh - VCC enable signal polarity is HIGH,<br>• kEmvsimVccEnIsLow- VCC enable signal polarity is LOW. |

**68.2.3.41 static emvsim\_vcc\_en\_polarity\_t EMVSIM\_HAL\_GetCardVCCEnablePolarity ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the polarity of the VCC enable signal from the EMVSIM controller.

## EMVSIM HAL driver

### Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

### Returns

kEmvsimVccEnIsHigh - VCC enable signal polarity is HIGH, kEmvsimVccEnIsLow- VCC enable signal polarity is LOW.

#### 68.2.3.42 **static void EMVSIM\_HAL\_SetVCCEnable ( EMVSIM\_Type \* *base*, bool *svccEnable* ) [inline], [static]**

This function controls the state of the VCC enable signal from the EMVSIM controller.

### Parameters

|                   |                                                                                      |
|-------------------|--------------------------------------------------------------------------------------|
| <i>base</i>       | EMVSIM module base pointer.                                                          |
| <i>svccEnable</i> | - true - Smart card voltage is enabled,<br>• false - Smart card voltage is disabled. |

#### 68.2.3.43 **static bool EMVSIM\_HAL\_GetVCCEnable ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the state of the VCC enable signal from the EMVSIM controller.

### Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

### Returns

true - Smart card voltage is enabled, false - Smart card voltage is disabled.

#### 68.2.3.44 **static void EMVSIM\_HAL\_EnableAutoPowerDown ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function enables the auto power down feature of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

**68.2.3.45 static void EMVSIM\_HAL\_DisableAutoPowerDown ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function disables the auto power down feature of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

**68.2.3.46 static bool EMVSIM\_HAL\_IsAutoPowerDownEnabled ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function returns the current state of the auto power down feature of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

true - Auto power down feature is enabled, false - Auto power down feature is disabled.

**68.2.3.47 static void EMVSIM\_HAL\_GetChar ( EMVSIM\_Type \* *base*, uint8\_t \* *readData* )  
[inline], [static]**

This function reads the byte value from the top of the received FIFO of the EMVSIM controller.

Parameters

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| <i>base</i>     | EMVSIM module base pointer.                               |
| <i>readData</i> | Pointer to memory where the read data byte must be stored |

**68.2.3.48 static uint32\_t EMVSIM\_HAL\_GetRxDataRegAddr ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function returns the address of the receive data byte register of the EMVSIM controller.

## EMVSIM HAL driver

### Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

### Returns

Address of receive data register

**68.2.3.49 static void EMVSIM\_HAL\_PutChar ( EMVSIM\_Type \* *base*, uint8\_t *writeData* )  
[inline], [static]**

This function writes a data byte to the transmit data FIFO of the EMVSIM controller.

### Parameters

|                  |                                                     |
|------------------|-----------------------------------------------------|
| <i>base</i>      | EMVSIM module base pointer.                         |
| <i>writeData</i> | Data byte value to be written to transmit data FIFO |

**68.2.3.50 static uint32\_t EMVSIM\_HAL\_GetTxDataRegAddr ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function returns the address of the transmit data byte register of the EMVSIM controller.

### Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

### Returns

Address of transmit data register

**68.2.3.51 static void EMVSIM\_HAL\_SetAdditionalTransmitterGuardTime ( EMVSIM\_Type \* *base*, uint8\_t *getu* ) [inline], [static]**

This function sets an additional transmitter guard time value of the EMVSIM controller.

### Parameters

---

|             |                                                                          |
|-------------|--------------------------------------------------------------------------|
| <i>base</i> | EMVSIM module base pointer.                                              |
| <i>getu</i> | Additional ETU guard time to be inserted between bytes to be transmitted |

**68.2.3.52 static uint8\_t EMVSIM\_HAL\_GetAdditionalTransmitterGuardTime ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the currently set value of the additional transmitter guard time of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Additional ETU guard time to be inserted between bytes to be transmitted

**68.2.3.53 static void EMVSIM\_HAL\_SetCharacterWaitTime ( EMVSIM\_Type \* *base*, uint16\_t *cwt* ) [inline], [static]**

This function sets the character wait time value of the EMVSIM controller.

Parameters

|             |                                    |
|-------------|------------------------------------|
| <i>base</i> | EMVSIM module base pointer.        |
| <i>cwt</i>  | Wait time value between characters |

**68.2.3.54 static uint16\_t EMVSIM\_HAL\_GetCharacterWaitTime ( EMVSIM\_Type \* *base* ) [inline], [static]**

This function returns the character wait time value of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Wait time value between characters

---

## EMVSIM HAL driver

**68.2.3.55** `static void EMVSIM_HAL_SetBlockWaitTime ( EMVSIM_Type * base, uint32_t bwt ) [inline], [static]`

This function sets the block wait time value of the EMVSIM controller.

Parameters

|             |                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i> | EMVSIM module base pointer.                                                                                                             |
| <i>bwt</i>  | Wait time value between the strat bit of last byte sent from EMVSIM module and the start bit of the first byte received from smart card |

**68.2.3.56 static uint32\_t EMVSIM\_HAL\_GetBlockWaitTime ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function returns the block wait time value of the EMVSIM controller.

Parameters

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

Returns

Wait time value between the strat bit of last byte sent from EMVSIM module and the start bit of the first byte received from smart card

**68.2.3.57 static void EMVSIM\_HAL\_SetBlockGuardTime ( EMVSIM\_Type \* *base*, uint16\_t *bgt* ) [inline], [static]**

This function sets the guard wait time value of the EMVSIM controller.

Parameters

|             |                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i> | EMVSIM module base pointer.                                                                                                              |
| <i>bgt</i>  | Guard time value between the strat bit of last byte sent from EMVSIM module and the start bit of the first byte received from smart card |

**68.2.3.58 static uint16\_t EMVSIM\_HAL\_GetBlockGuardTime ( EMVSIM\_Type \* *base* )  
[inline], [static]**

This function returns the guard wait time value of the EMVSIM controller.

Parameters

\_\_\_\_\_

## EMVSIM HAL driver

|             |                             |
|-------------|-----------------------------|
| <i>base</i> | EMVSIM module base pointer. |
|-------------|-----------------------------|

### Returns

Guard time value between the strat bit of last byte sent from EMVSIM module and the start bit of the first byte received from smart card

### 68.2.3.59 void EMVSIM\_HAL\_SetGPCNTValue ( EMVSIM\_Type \* *base*, uint8\_t *gpcntIndex*, uint16\_t *gpcntVal* )

This function sets the timeout values of the general purpose counters of the EMVSIM controller.

### Parameters

|                   |                                   |
|-------------------|-----------------------------------|
| <i>base</i>       | EMVSIM module base pointer.       |
| <i>gpcntIndex</i> | Index to general purpose counters |
| <i>gpcntVal</i>   | Timer timeout value               |

### 68.2.3.60 uint16\_t EMVSIM\_HAL\_GetGPCNTValue ( EMVSIM\_Type \* *base*, uint8\_t *gpcntIndex* )

This function returns the timeout values of the general purpose counters of the EMVSIM controller.

### Parameters

|                   |                                   |
|-------------------|-----------------------------------|
| <i>base</i>       | EMVSIM module base pointer.       |
| <i>gpcntIndex</i> | Index to general purpose counters |

### Returns

Timer timeout value

### **68.2.3.61 Smart Card Interface Direct Driver**

The Smart Card interface direct driver handles the EMVSIM peripheral, which covers all necessary functions to control the ICC. These functions are ICC clock setup, ICC voltage setup, ICC card detection, activation/deactivation, and ICC reset sequences. The EMVSIM peripheral covers all features of interface ICC chips.

## EMV SIM HAL driver

### 68.2.4 Smart Card Interface Driver

#### 68.2.4.1 Overview

This section describes features of Smart Card interface drivers which handle all necessary ICC actions, such as activation/deactivation, reset sequence and operating voltage setting.

The Smart Card interface driver is initialized by calling function [SMARTCARD\\_DRV\\_Init\(\)](#), which calls the internal interface driver initialization. During the initialization phase, internal driver structures are initialized and additional hardware settings which are specific for each interface driver.

#### Modules

- [Smart Card Interface Direct Driver](#)
- [Smart Card Interface NCN8025 Driver](#)

#### 68.2.4.2 Smart Card Interface NCN8025 Driver

The Smart Card interface NCN8025 driver handles the external interface chip NCN8025 which supports all necessary functions to control the ICC. These functions involve ICC pin initialization, ICC clock generation, ICC card detection, and activation/deactivation sequences.

---

## EMVSIM HAL driver

### 68.2.5 Smart Card UART Driver

The Smart Card UART driver uses a standard UART peripheral which supports the ISO-7816 standard. The driver supports transmission functionality in CPU and also DMA mode. The driver also supports blocking (synchronous) and non-blocking (asynchronous) types of data transfers.

## 68.3 Smart Card driver

### 68.3.1 Overview

This chapter describes the programming interface of the Smart Card driver.

The driver provides synchronous and also asynchronous functions to communicate with the Integrated Circuit Card (ICC). The driver uses a semaphores as synchronization objects of synchronous transfers. The driver is implemented single threaded and additional protection for multithreading is not supported.

Smart Card driver also provides DMA transfers, which is useful for bigger transfer sizes. This feature can be activated in the Smart Card user configuration.

### 68.3.2 SmartCard Driver Initialization

Smart Card Driver is initialized by calling the [SMARTCARD\\_DRV\\_Init\(\)](#) function. If DMA features are required, initialize eDMA driver first. The Smart Card Driver initialization configuration structure requires these settings:

- Smart Card voltage class
- Smart Card Interface options such as the RST, IRQ, CLK pins, and so on.

The driver also supports user callback installation for assertion/de-assertion Smart Card events. This feature is useful to detect the card presence following a card reset. The user should initialize the Smart Card driver, which then initializes IP and PHY drivers. In other words, the user should use only the Smart Card driver which covers all functionality.

### 68.3.3 SmartCard Call diagram

Because the call diagram is complex, the detailed use of the Smart Card driver is not described in this section. For details how to use the Smart Card driver, see the Smart Card driver example which demonstrates a simple use case.

## Modules

- [Smart Card EMVSIM Driver](#)
- [Smart Card Interface Driver](#)
- [Smart Card UART Driver](#)

## Data Structures

- struct [smartcard\\_card\\_params\\_t](#)  
*Defines card-specific parameters for Smart card driver. [More...](#)*
- struct [smartcard\\_timers\\_state\\_t](#)  
*Defines the state of the EMV timers in the Smart card driver. [More...](#)*

## Smart Card driver

- struct [smartcard\\_ext\\_timer\\_config\\_t](#)  
*Defines state of user specified configuration of Smart card interface. [More...](#)*
- struct [smartcard\\_interface\\_config\\_t](#)  
*Defines state of user specified configuration of Smart card interface. [More...](#)*
- struct [smartcard\\_interface\\_state\\_t](#)  
*Defines state of Smart card interface slots. [More...](#)*
- struct [smartcard\\_state\\_t](#)  
*Runtime state of the Smart card driver. [More...](#)*
- struct [smartcard\\_user\\_config\\_t](#)  
*User configuration structure for the Smart card driver. [More...](#)*
- struct [smartcard\\_driver\\_interface\\_t](#)  
*Smart card driver interface, which holds function pointers for implementation-specific functions. [More...](#)*
- struct [smartcard\\_interface\\_slot\\_t](#)  
*SMARTCARD interface slot parameters, specific to interface IC. [More...](#)*

## Typedefs

- typedef void(\* [smartcard\\_interface\\_callback\\_t](#))(uint32\_t instance, void \*smartcardState)  
*Smart card interface interrupt callback function type.*

## Enumerations

- enum [smartcard\\_status\\_t](#)  
*Error codes for the Smart card driver.*
- enum [smartcard\\_control\\_t](#)  
*Control codes for the Smart card protocol timers and misc.*
- enum [smartcard\\_card\\_voltage\\_class\\_t](#)  
*Defines Smart card interface voltage class values.*
- enum [smartcard\\_transfer\\_state\\_t](#)  
*Defines Smart card I/O transfer states.*
- enum [smartcard\\_reset\\_type\\_t](#)  
*Defines Smart card reset types.*
- enum [smartcard\\_transport\\_type\\_t](#)  
*Defines Smart card transport protocol types.*
- enum [smartcard\\_parity\\_type\\_t](#)  
*Defines Smart card data parity types.*
- enum [smartcard\\_xfer\\_mode\\_t](#)  
*Defines data transfer mode: CPU or DMA.*
- enum [smartcard\\_card\\_convention\\_t](#)  
*Defines data convention format.*
- enum [smartcard\\_interface\\_control\\_t](#)  
*Defines interface IC control types.*
- enum [smartcard\\_interface\\_control\\_t](#)  
*Defines interface IC control types.*

## Functions

- void [SMARTCARD\\_DRV\\_InstallDriverFunctions](#) ([smartcard\\_driver\\_interface\\_t](#) \*smartcardDrv-InterfacePtr)  
*Installs the Smart card peripheral driver functions.*
- void [SMARTCARD\\_DRV\\_InstallInterfaceFunctions](#) ([smartcard\\_driver\\_interface\\_t](#) \*smartcard-DrvInterfacePtr)  
*Installs the Smart card PHY/interface driver functions.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_Init](#) ([uint32\\_t](#) instance, [smartcard\\_state\\_t](#) \*smartcard-StatePtr, const [smartcard\\_user\\_config\\_t](#) \*smartcardUserConfig)  
*Initializes a Smart card instance for operation.*
- void [SMARTCARD\\_DRV\\_Deinit](#) ([uint32\\_t](#) instance)  
*Shuts down the Smart card by disabling interrupts and the transmitter/receiver.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_SendDataBlocking](#) ([uint32\\_t](#) instance, const [uint8\\_t](#) \*tx-Buffer, [uint32\\_t](#) txSize, [uint32\\_t](#) timeout)  
*Sends (transmits) data out through the Smart card module using a blocking method.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_SendData](#) ([uint32\\_t](#) instance, const [uint8\\_t](#) \*txBuff, [uint32\\_t](#) txSize)  
*Sends (transmits) data through the Smart card module using a non-blocking method.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_GetTransmitStatus](#) ([uint32\\_t](#) instance, [uint32\\_t](#) \*bytes-Remaining)  
*Returns whether the previous Smart card transmit has finished.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_AbortSendingData](#) ([uint32\\_t](#) instance)  
*Terminates an asynchronous Smart card transmission early.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_ReceiveDataBlocking](#) ([uint32\\_t](#) instance, [uint8\\_t](#) \*rx-Buffer, [uint32\\_t](#) rxSize, [uint32\\_t](#) \*rcvdSize, [uint32\\_t](#) timeout)  
*Gets (receives) data from the Smart card module using a blocking method.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_ReceiveData](#) ([uint32\\_t](#) instance, [uint8\\_t](#) \*rxBuff, [uint32\\_t](#) rxSize)  
*Gets (receives) data from the Smart card module using a non-blocking method.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_GetReceiveStatus](#) ([uint32\\_t](#) instance, [uint32\\_t](#) \*bytes-Remaining)  
*Returns whether the previous Smart card receive is complete.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_AbortReceivingData](#) ([uint32\\_t](#) instance)  
*Terminates an asynchronous Smart card receive early.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_Control](#) ([uint32\\_t](#) instance, [smartcard\\_control\\_t](#) control, void \*controlBuff)  
*Controls the Smart card modules per different user requests.*
- [smartcard\\_interface\\_callback\\_t](#) [SMARTCARD\\_DRV\\_InstallInterfaceCallback](#) ([uint32\\_t](#) instance, [smartcard\\_interface\\_callback\\_t](#) function, void \*callbackParam)  
*Installs a user callback function to be called after any interface interrupt is serviced.*
- void [SMARTCARD\\_DRV\\_Reset](#) ([uint32\\_t](#) instance, [smartcard\\_reset\\_type\\_t](#) resetType)  
*Resets the Smart card interface/card slot for the given reset type.*
- void [SMARTCARD\\_DRV\\_Deactivate](#) ([uint32\\_t](#) instance)  
*Deactivates the Smart card interface/card slot.*
- void [SMARTCARD\\_DRV\\_InterfaceControl](#) ([uint32\\_t](#) instance, void \*interfaceControl, void \*param)  
*Reads the status of card presence from the Smart card interface/card slot.*
- [smartcard\\_status\\_t](#) [SMARTCARD\\_DRV\\_DirectInit](#) ([uint32\\_t](#) interfaceInstance, [smartcard\\_state\\_t](#)

## Smart Card driver

- `*smartcardStatePtr, const smartcard_interface_config_t *interfaceUserConfig)`  
*Initializes an SMARTCARD interface instance for operation.*
- `void SMARTCARD_DRV_DirectDeInit (uint32_t instance)`  
*De-initializes an SMARTCARD interface instance for operation.*
- `smartcard_interface_callback_t SMARTCARD_DRV_DirectInstallCallback (uint32_t instance, smartcard_interface_callback_t function, void *callbackParam)`  
*Installs a callback function for an SMARTCARD interface instance.*
- `void SMARTCARD_DRV_DirectActivate (uint32_t instance, smartcard_reset_type_t resetType)`  
*Activates the SMARTCARD interface.*
- `void SMARTCARD_DRV_DirectDeactivate (uint32_t instance)`  
*De-activates the SMARTCARD interface.*
- `void SMARTCARD_DRV_DirectControl (uint32_t instance, void *interfaceControl, void *param)`  
*Controls SMARTCARD interface IC.*
- `smartcard_status_t SMARTCARD_DRV_NCN8025Init (uint32_t interfaceInstance, smartcard_state_t *smartcardStatePtr, const smartcard_interface_config_t *interfaceUserConfig)`  
*Initializes an SMARTCARD interface instance for operation.*
- `void SMARTCARD_DRV_NCN8025DeInit (uint32_t instance)`  
*De-initializes an SMARTCARD interface instance for operation.*
- `smartcard_interface_callback_t SMARTCARD_DRV_NCN8025InstallCallback (uint32_t instance, smartcard_interface_callback_t function, void *callbackParam)`  
*Installs a callback function for an SMARTCARD interface instance.*
- `void SMARTCARD_DRV_NCN8025Activate (uint32_t instance, smartcard_reset_type_t resetType)`  
*Activates the SMARTCARD interface.*
- `void SMARTCARD_DRV_NCN8025Deactivate (uint32_t instance)`  
*De-activates the SMARTCARD interface.*
- `void SMARTCARD_DRV_NCN8025Control (uint32_t instance, void *interfaceControl, void *param)`  
*Controls SMARTCARD interface IC.*
- `void SMARTCARD_DRV_NCN8025IRQHandler (uint32_t instance)`  
*SMARTCARD interface IC IRQ ISR.*

## Variables

- `EMVSIM_Type *const g_emvsimBase [EMVSIM_INSTANCE_COUNT]`  
*Table of base addresses for EMVSIM instances.*
- `UART_Type *const g_uartBase [UART_INSTANCE_COUNT]`  
*Table of base addresses for UART instances.*

## Smart card Interrupt Driver

- `smartcard_status_t SMARTCARD_EMVSIM_DRV_Init (uint32_t instance, smartcard_state_t *smartcardStatePtr, const smartcard_user_config_t *smartcardUserConfig)`  
*Initializes an EMVSIM instance for Smart card/EMV operation.*
- `void SMARTCARD_EMVSIM_DRV_Deinit (uint32_t instance)`  
*This function disables the EMVSIM interrupts, disables the transmitter and receiver, and flushes the FIFOs (for modules that support FIFOs).*

- [smartcard\\_status\\_t SMARTCARD\\_EMVSIM\\_DRV\\_SendDataBlocking](#) (uint32\_t instance, const uint8\_t \*txBuff, uint32\_t txSize, uint32\_t timeout)  
*Sends (transmits) data out through the EMVSIM module using a blocking method.*
- [smartcard\\_status\\_t SMARTCARD\\_EMVSIM\\_DRV\\_SendData](#) (uint32\_t instance, const uint8\_t \*txBuff, uint32\_t txSize)  
*Sends (transmits) data through the EMVSIM module using a non-blocking method.*
- [smartcard\\_status\\_t SMARTCARD\\_EMVSIM\\_DRV\\_GetTransmitStatus](#) (uint32\_t instance, uint32\_t \*bytesRemaining)  
*Returns whether the previous EMVSIM transmit has finished.*
- [smartcard\\_status\\_t SMARTCARD\\_EMVSIM\\_DRV\\_AbortSendingData](#) (uint32\_t instance)  
*Terminates an asynchronous EMVSIM transmission early.*
- [smartcard\\_status\\_t SMARTCARD\\_EMVSIM\\_DRV\\_ReceiveDataBlocking](#) (uint32\_t instance, uint8\_t \*rxBuff, uint32\_t rxSize, uint32\_t \*rcvdSize, uint32\_t timeout)  
*Gets (receives) data from the EMVSIM module using a blocking method.*
- [smartcard\\_status\\_t SMARTCARD\\_EMVSIM\\_DRV\\_ReceiveData](#) (uint32\_t instance, uint8\_t \*rxBuff, uint32\_t rxSize)  
*Gets (receives) data from the EMVSIM module using a non-blocking method.*

*Smart card interface card slots state pointers.*

### 68.3.4.6 `struct smartcard_state_t`

#### Data Fields

- `uint8_t txFifoEntryCount`  
*Number of data word entries in transmit FIFO.*
- `const uint8_t * txBuff`  
*The buffer of data being sent.*
- `uint8_t * rxBuff`  
*The buffer of received data.*
- `volatile size_t txSize`  
*The remaining number of bytes to be transmitted.*
- `volatile size_t rxSize`

- The remaining number of bytes to be received.*
- volatile bool **isTxBusy**

*True if there is an active transmit.*
- volatile bool **isRxBusy**

*True if there is an active receive.*
- volatile bool **isTxBlocking**

*True if transmit is blocking transaction.*
- volatile bool **isRxBlocking**

*True if receive is blocking transaction.*
- volatile bool **bwtActive**

*True if Global Counter 1 is set to wait for min.*
- semaphore\_t **txIrqSync**

*Used to wait for ISR to complete its transmit.*
- semaphore\_t **rxIrqSync**

*Used to wait for ISR to complete its receive.*
- smartcard\_interface\_callback\_t **interfaceCallback**

*Callback to invoke after interface IC raised interrupt.*
- void \* **interfaceCallbackParam**

*Interface callback parameter pointer.*
- uint32\_t **sCClock**

*Smart card clock set in Hz.*
- smartcard\_transport\_type\_t **tType**

*Transfer type.*
- bool **useDMA**

*Indicates whether to use DMA mode.*
- smartcard\_reset\_type\_t **resetType**

*Indicates whether a Cold reset or Warm reset was requested.*
- smartcard\_transfer\_state\_t **transState**

*Indicates the current transfer state.*
- uint8\_t **IFSD**

*Indicates IFSD value of the terminal.*
- smartcard\_parity\_type\_t **parity**

*Indicates current parity even/odd.*
- volatile bool **rxTCrossed**

*Indicates whether RXT thresholds has been crossed.*
- volatile bool **txTCrossed**

*Indicates whether TXT thresholds has been crossed.*
- volatile bool **wtxRequested**

*Indicates whether WTX has been requested or not.*
- volatile bool **parityError**

*Indicates whether a parity error has been detected.*
- uint8\_t **statusBytes** [2]

*Used to store Status bytes SW1, SW2 of the last executed card command response.*
- smartcard\_interface\_state\_t \* **interfaceState**

*Holds a pointer to the working state of the Interface IC.*
- smartcard\_interface\_config\_t **interfaceConfig**

*Indicates the card slot number of the interface IC.*
- smartcard\_ext\_timer\_config\_t **extTimerConfig**

*Indicates the id of TS detection and ATR timers.*
- smartcard\_timers\_state\_t **timersState**

*Indicates the state of different protocol timers used in driver.*

## Smart Card driver

- [smartcard\\_card\\_params\\_t cardParams](#)  
*Indicates the card parameters (ATR and current)*

68.3.4.6.0.3.15 `smartcard_reset_type_t smartcard_state_t::resetType`

### 68.3.4.7 struct smartcard\_user\_config\_t

Use an instance of this structure with the [SMARTCARD\\_DRV\\_Init\(\)](#) function. This enables configuration of the most common settings of the UART peripheral with a single function call. Settings include: Smart card clock, Smart card interface configuration: interface instance no, slot no; Smart card operating voltage request: 1.8V, 3.3V, 5V.

### Data Fields

- `uint32_t sCClock`  
*Smart card Clock set in Hz.*
- [smartcard\\_xfer\\_mode\\_t xferMode](#)  
*Smart card driver transfer mode.*

- [smartcard\\_interface\\_config\\_t interfaceConfig](#)  
*Smart card interface configuration.*
- [smartcard\\_ext\\_timer\\_config\\_t extTimerConfig](#)  
*Indicates the id of TS detection and ATR timers.*

- *Function pointer to Smart card implementation-specific function to read status information.*

### 68.3.4.9 struct smartcard\_interface\_slot\_t

#### Data Fields

- uint32\_t [clockToResetDelay](#)  
*Indicates clock to RST apply delay.*
- [smartcard\\_card\\_voltage\\_class\\_t](#) [vcc](#)  
*Indicates smart card voltage classes.*
- bool [present](#)  
*Indicates if a smart card is present.*
- bool [active](#)  
*Indicates if the smart card is activated.*
- uint8\_t [status](#)  
*Indicates smart card status.*
- bool [faulty](#)  
*Indicates whether smart card/interface is faulty.*

### 68.3.5 Enumeration Type Documentation

#### 68.3.5.1 enum smartcard\_status\_t

#### 68.3.5.2 enum smartcard\_control\_t

### 68.3.6 Function Documentation

#### 68.3.6.1 void SMARTCARD\_DRV\_InstallDriverFunctions ( [smartcard\\_driver\\_interface\\_t](#) \* [smartcardDrvInterfacePtr](#) )

Parameters

|                                  |                                                                           |
|----------------------------------|---------------------------------------------------------------------------|
| <i>smartcardDrv-InterfacePtr</i> | Pointer to the Smart card composite driver structure of function pointers |
|----------------------------------|---------------------------------------------------------------------------|

**68.3.6.2 void SMARTCARD\_DRV\_InstallInterfaceFunctions ( smartcard\_driver\_interface\_t \* smartcardDrvInterfacePtr )**

Parameters

|                                  |                                                                           |
|----------------------------------|---------------------------------------------------------------------------|
| <i>smartcardDrv-InterfacePtr</i> | Pointer to the Smart card composite driver structure of function pointers |
|----------------------------------|---------------------------------------------------------------------------|

**68.3.6.3 smartcard\_status\_t SMARTCARD\_DRV\_Init ( uint32\_t instance, smartcard\_state\_t \* smartcardStatePtr, const smartcard\_user\_config\_t \* smartcardUserConfig )**

This function initializes the run-time state structure to keep track of the on-going transfers, un-gates the clock to the Smart card module, initializes the module to user-defined settings and default settings, configures the IRQ state structure, and enables the module-level interrupt to the core, and the Smart card module transmitter and receiver.

Parameters

|                             |                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>             | The Smart card instance number.                                                                                                                                                                                                                                                 |
| <i>smartcard-StatePtr</i>   | A pointer to the Smart card driver state structure memory. The user is only responsible to pass in the memory for this run-time state structure and the Smart card driver fills out the members. This run-time state structure keeps track of the current transfer in progress. |
| <i>smartcard-UserConfig</i> | The user configuration structure of type <a href="#">smartcard_user_config_t</a> . The user is responsible to fill out the members of this structure and to pass the pointer of this structure into this function.                                                              |

Returns

An error code or kStatus\_SMARTCARD\_Success.

**68.3.6.4 void SMARTCARD\_DRV\_Deinit ( uint32\_t instance )**

This function disables the Smart card interrupts, the transmitter and receiver, and flushes the FIFOs (for modules that support FIFOs).

## Smart Card driver

### Parameters

|                 |                                 |
|-----------------|---------------------------------|
| <i>instance</i> | The Smart card instance number. |
|-----------------|---------------------------------|

### 68.3.6.5 smartcard\_status\_t SMARTCARD\_DRV\_SendDataBlocking ( uint32\_t instance, const uint8\_t \* txBuff, uint32\_t txSize, uint32\_t timeout )

A blocking (also known as synchronous) function means that the function does not return until the transmit is complete. This blocking function is used to send data through the Smart card port.

### Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The Smart card instance number.                                         |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send.     |
| <i>txSize</i>   | The number of bytes to send.                                            |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

### Returns

An error code or kStatus\_SMARTCARD\_Success.

### 68.3.6.6 smartcard\_status\_t SMARTCARD\_DRV\_SendData ( uint32\_t instance, const uint8\_t \* txBuff, uint32\_t txSize )

A non-blocking (also known as asynchronous) function means that the function returns immediately after initiating the transmit function. The application has to get the transmit status to see when the transmit is complete. In other words, after calling non-blocking (asynchronous) send function, the application must get the transmit status to check if transmit is complete. The asynchronous method of transmitting and receiving allows the Smart card to perform a full duplex operation (simultaneously transmit and receive).

### Parameters

|                 |                                                                     |
|-----------------|---------------------------------------------------------------------|
| <i>instance</i> | The Smart card module instance number.                              |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send. |
| <i>txSize</i>   | The number of bytes to send.                                        |

Returns

An error code or `kStatus_SMARTCARD_Success`.

**68.3.6.7 smartcard\_status\_t SMARTCARD\_DRV\_GetTransmitStatus ( uint32\_t *instance*, uint32\_t \* *bytesRemaining* )**

When performing an a-sync transmit, call this function to ascertain the state of the current transmission: in progress (or busy) or complete (success). If the transmission is still in progress, the user can obtain the number of words that have been transferred.

Parameters

|                        |                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The Smart card module instance number.                                                                     |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes that are remaining in the active transfer. |

Return values

|                                  |                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_SMARTCARD_Success</i> | The transmit has completed successfully.                                                                                                    |
| <i>kStatus_SMARTCARD_TxBusy</i>  | The transmit is still in progress. <code>bytesTransmitted</code> is filled with the number of bytes which are transmitted up to that point. |

**68.3.6.8 smartcard\_status\_t SMARTCARD\_DRV\_AbortSendingData ( uint32\_t *instance* )**

During an a-sync Smart card transmission, the user can terminate the transmission early if the transmission is still in progress.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>instance</i> | The Smart card module instance number. |
|-----------------|----------------------------------------|

Return values

---

## Smart Card driver

|                                                          |                                           |
|----------------------------------------------------------|-------------------------------------------|
| <i>kStatus_SMARTCARD_</i><br><i>Success</i>              | The transmit was successful.              |
| <i>kStatus_SMARTCARD_</i><br><i>NoTransmitInProgress</i> | No transmission is currently in progress. |

### 68.3.6.9 `smartcard_status_t SMARTCARD_DRV_ReceiveDataBlocking ( uint32_t instance, uint8_t * rxBuff, uint32_t rxSize, uint32_t * rcvdSize, uint32_t timeout )`

A blocking (also known as synchronous) function means that the function does not return until the receive is complete. This blocking function sends data through the UART port.

#### Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The Smart card module instance number.                                  |
| <i>rxBuff</i>   | A pointer to the buffer containing 8-bit read data chars received.      |
| <i>rxSize</i>   | The number of bytes to receive.                                         |
| <i>rcvdSize</i> | The number of bytes actually received.                                  |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

#### Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.10 `smartcard_status_t SMARTCARD_DRV_ReceiveData ( uint32_t instance, uint8_t * rxBuff, uint32_t rxSize )`

A non-blocking (also known as asynchronous) function means that the function returns immediately after initiating the receive function. The application has to get the receive status to see when the receive is complete. In other words, after calling non-blocking (asynchronous) get function, the application must get the receive status to check if receive is completed or not. The asynchronous method of transmitting and receiving allows the UART to perform a full duplex operation (simultaneously transmit and receive).

#### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>instance</i> | The Smart card module instance number. |
|-----------------|----------------------------------------|

|               |                                                                    |
|---------------|--------------------------------------------------------------------|
| <i>rxBuff</i> | A pointer to the buffer containing 8-bit read data chars received. |
| <i>rxSize</i> | The number of bytes to receive.                                    |

Returns

An error code or `kStatus_SMARTCARD_Success`.

#### 68.3.6.11 `smartcard_status_t SMARTCARD_DRV_GetReceiveStatus ( uint32_t instance, uint32_t * bytesRemaining )`

When performing an a-sync receive, the user can call this function to ascertain the state of the current receive progress: in progress (or busy) or complete (success). In addition, if the receive is still in progress, the user can obtain the number of words that have been currently received.

Parameters

|                        |                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The Smart card module instance number.                                                                                  |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes which still need to be received in the active transfer. |

Return values

|                                   |                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_SMARTCARD_-Success</i> | The receive has completed successfully.                                                                                        |
| <i>kStatus_SMARTCARD_-RxBusy</i>  | The receive is still in progress. <i>bytesReceived</i> is filled with the number of bytes which are received up to that point. |

#### 68.3.6.12 `smartcard_status_t SMARTCARD_DRV_AbortReceivingData ( uint32_t instance )`

During an a-sync UART receive, the user can terminate the receive early if the receive is still in progress.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>instance</i> | The Smart card module instance number. |
|-----------------|----------------------------------------|

Return values

## Smart Card driver

|                                                          |                                              |
|----------------------------------------------------------|----------------------------------------------|
| <i>kStatus_SMARTCARD_</i><br><i>Success</i>              | Aborting the receive process was successful. |
| <i>kStatus_SMARTCARD_</i><br><i>NoTransmitInProgress</i> | No receive is currently in progress.         |

### 68.3.6.13 **smartcard\_status\_t SMARTCARD\_DRV\_Control ( uint32\_t *instance*, smartcard\_control\_t *control*, void \* *controlBuff* )**

#### Parameters

|                 |                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------|
| <i>instance</i> | The Smart card module instance number.                                                  |
| <i>control</i>  | control parameter. controlBuff A buffer pointer to be used along with control parameter |

#### Return values

|           |                                        |
|-----------|----------------------------------------|
| <i>An</i> | error code as per operation execution. |
|-----------|----------------------------------------|

### 68.3.6.14 **smartcard\_interface\_callback\_t SMARTCARD\_DRV\_InstallInterfaceCallback ( uint32\_t *instance*, smartcard\_interface\_callback\_t *function*, void \* *callbackParam* )**

#### Parameters

|                      |                                                   |
|----------------------|---------------------------------------------------|
| <i>instance</i>      | The Smart card module instance number.            |
| <i>function</i>      | Pointer to interface callback function.           |
| <i>callbackParam</i> | Pointer to interface callback function parameter. |

#### Return values

|                 |                                                  |
|-----------------|--------------------------------------------------|
| <i>Function</i> | pointer of the last installed callback function. |
|-----------------|--------------------------------------------------|

### 68.3.6.15 **void SMARTCARD\_DRV\_Reset ( uint32\_t *instance*, smartcard\_reset\_type\_t *resetType* )**

## Parameters

|                  |                                                                                           |
|------------------|-------------------------------------------------------------------------------------------|
| <i>instance</i>  | The Smart card module instance number.                                                    |
| <i>resetType</i> | type of reset to be performed, possible values = kSmartcardColdReset, kSmartcardWarmReset |

**68.3.6.16 void SMARTCARD\_DRV\_Deactivate ( uint32\_t *instance* )**

## Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>instance</i> | The Smart card module instance number. |
|-----------------|----------------------------------------|

**68.3.6.17 void SMARTCARD\_DRV\_InterfaceControl ( uint32\_t *instance*, void \* *interfaceControl*, void \* *param* )**

## Parameters

|                         |                                        |
|-------------------------|----------------------------------------|
| <i>instance</i>         | The Smart card module instance number. |
| <i>interfaceControl</i> | interface control type                 |
| <i>param</i>            | interface control parameter if any     |

**68.3.6.18 smartcard\_status\_t SMARTCARD\_EMVSIM\_DRV\_Init ( uint32\_t *instance*, smartcard\_state\_t \* *smartcardStatePtr*, const smartcard\_user\_config\_t \* *smartcardUserConfig* )**

This function initializes the run-time state structure to keep track of the on-going transfers, un-gates the clock to the Smart card module, initializes the module to user-defined settings and default settings, configures the IRQ state structure, and enables the module-level interrupt to the core, initializes the DMA, and enables the Smart card module transmitter and receiver.

## Parameters

|                 |                             |
|-----------------|-----------------------------|
| <i>instance</i> | The EMVSIM instance number. |
|-----------------|-----------------------------|

## Smart Card driver

|                             |                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>smartcard-StatePtr</i>   | A pointer to the Smart card driver state structure memory. The user is only responsible to pass in the memory for this run-time state structure and the Smart card driver fills out the members. This run-time state structure keeps track of the current transfer in progress. |
| <i>smartcard-UserConfig</i> | The user configuration structure of type <a href="#">smartcard_user_config_t</a> . The user is responsible to fill out the members of this structure and to pass the pointer of this structure into this function.                                                              |

### Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.19 void SMARTCARD\_EMVSIM\_DRV\_Deinit ( uint32\_t *instance* )

#### Parameters

|                 |                             |
|-----------------|-----------------------------|
| <i>instance</i> | The EMVSIM instance number. |
|-----------------|-----------------------------|

### 68.3.6.20 smartcard\_status\_t SMARTCARD\_EMVSIM\_DRV\_SendDataBlocking ( uint32\_t *instance*, const uint8\_t \* *txBuff*, uint32\_t *txSize*, uint32\_t *timeout* )

A blocking (also known as synchronous) function means that the function does not return until the transmit is complete. This blocking function is used to send data through the EMVSIM port.

#### Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The EMVSIM instance number.                                             |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send.     |
| <i>txSize</i>   | The number of bytes to send.                                            |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

### Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.21 smartcard\_status\_t SMARTCARD\_EMVSIM\_DRV\_SendData ( uint32\_t *instance*, const uint8\_t \* *txBuff*, uint32\_t *txSize* )

A non-blocking (also known as asynchronous) function means that the function returns immediately after initiating the transmit function. The application has to get the transmit status to see when the transmit is

complete. In other words, after calling non-blocking (asynchronous) send function, the application must get the transmit status to check if transmit is complete.

## Smart Card driver

### Parameters

|                 |                                                                     |
|-----------------|---------------------------------------------------------------------|
| <i>instance</i> | The EMVSIM module instance number.                                  |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send. |
| <i>txSize</i>   | The number of bytes to send.                                        |

### Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.22 `smartcard_status_t SMARTCARD_EMVSIM_DRV_GetTransmitStatus ( uint32_t instance, uint32_t * bytesRemaining )`

When performing an async transmit, call this function to ascertain the state of the current transmission: in progress (or busy) or complete (success). If the transmission is still in progress, the user can obtain the number of words that have been transferred.

### Parameters

|                        |                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The EMVSIM module instance number.                                                                         |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes that are remaining in the active transfer. |

### Return values

|                                  |                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_SMARTCARD_Success</i> | The transmit has completed successfully.                                                                                                    |
| <i>kStatus_SMARTCARD_TxBusy</i>  | The transmit is still in progress. <code>bytesTransmitted</code> is filled with the number of bytes which are transmitted up to that point. |

### 68.3.6.23 `smartcard_status_t SMARTCARD_EMVSIM_DRV_AbortSendingData ( uint32_t instance )`

During an async EMVSIM transmission, the user can terminate the transmission early if the transmission is still in progress.

### Parameters

---

|                 |                                    |
|-----------------|------------------------------------|
| <i>instance</i> | The EMVSIM module instance number. |
|-----------------|------------------------------------|

Return values

|                                                  |                                           |
|--------------------------------------------------|-------------------------------------------|
| <i>kStatus_SMARTCARD_ - Success</i>              | The transmit abort was successful.        |
| <i>kStatus_SMARTCARD_ - NoTransmitInProgress</i> | No transmission is currently in progress. |

**68.3.6.24 smartcard\_status\_t SMARTCARD\_EMVSIM\_DRV\_ReceiveDataBlocking ( uint32\_t instance, uint8\_t \* rxBuff, uint32\_t rxSize, uint32\_t \* rcvdSize, uint32\_t timeout )**

A blocking (also known as synchronous) function means that the function does not return until the reception is complete. This blocking function receives data through the EMVSIM port.

Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The EMVSIM module instance number.                                      |
| <i>rxBuff</i>   | A pointer to the buffer containing 8-bit read data chars received.      |
| <i>rxSize</i>   | The number of bytes to receive.                                         |
| <i>rcvdSize</i> | The number of bytes actually received.                                  |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

Returns

An error code or kStatus\_SMARTCARD\_Success.

**68.3.6.25 smartcard\_status\_t SMARTCARD\_EMVSIM\_DRV\_ReceiveData ( uint32\_t instance, uint8\_t \* rxBuff, uint32\_t rxSize )**

A non-blocking (also known as asynchronous) function means that the function returns immediately after initiating the receive function. The application has to get the receive status to see when the receive is complete. In other words, after calling non-blocking (asynchronous) get function, the application must get the receive status to check if receive is completed or not.

## Smart Card driver

### Parameters

|                 |                                                                    |
|-----------------|--------------------------------------------------------------------|
| <i>instance</i> | The EMVSIM module instance number.                                 |
| <i>rxBuff</i>   | A pointer to the buffer containing 8-bit read data chars received. |
| <i>rxSize</i>   | The number of bytes to receive.                                    |

### Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.26 `smartcard_status_t SMARTCARD_EMVSIM_DRV_GetReceiveStatus ( uint32_t instance, uint32_t * bytesRemaining )`

When performing an a-sync receive, the user can call this function to ascertain the state of the current receive progress: in progress (or busy) or complete (success). In addition, if the reception is still in progress, the user can obtain the number of words that have been currently received.

### Parameters

|                        |                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The EMVSIM module instance number.                                                                                      |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes which still need to be received in the active transfer. |

### Return values

|                                  |                                                                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_SMARTCARD_Success</i> | The receive has completed successfully.                                                                                              |
| <i>kStatus_SMARTCARD_RxBusy</i>  | The receive is still in progress. <code>bytesReceived</code> is filled with the number of bytes which are received up to that point. |

### 68.3.6.27 `smartcard_status_t SMARTCARD_EMVSIM_DRV_AbortReceivingData ( uint32_t instance )`

During an a-sync EMVSIM receive, the user can terminate the receive early if the receive is still in progress.

### Parameters

---

|                 |                                    |
|-----------------|------------------------------------|
| <i>instance</i> | The EMVSIM module instance number. |
|-----------------|------------------------------------|

Return values

|                                                 |                                        |
|-------------------------------------------------|----------------------------------------|
| <i>kStatus_SMARTCARD_ - Success</i>             | The abort in reception was successful. |
| <i>kStatus_SMARTCARD_ - NoReceiveInProgress</i> | No receive is currently in progress.   |

**68.3.6.28 smartcard\_status\_t SMARTCARD\_EMVSIM\_DRV\_Control ( uint32\_t *instance*, smartcard\_control\_t *control*, void \* *controlBuff* )**

Parameters

|                    |                                                 |
|--------------------|-------------------------------------------------|
| <i>instance</i>    | The EMVSIM module instance number.              |
| <i>control</i>     | Control type                                    |
| <i>controlBuff</i> | A pointer to parameter specific to control type |

Return values

|                                     |                                       |
|-------------------------------------|---------------------------------------|
| <i>kStatus_SMARTCARD_ - Success</i> | The control operation was successful. |
|-------------------------------------|---------------------------------------|

**68.3.6.29 smartcard\_status\_t SMARTCARD\_UART\_DRV\_Init ( uint32\_t *instance*, smartcard\_state\_t \* *smartcardStatePtr*, const smartcard\_user\_config\_t \* *smartcardUserConfig* )**

This function initializes the run-time state structure to keep track of the on-going transfers, un-gates the clock to the Smart card module, initializes the module to user-defined settings and default settings, configures the IRQ state structure, and enables the module-level interrupt to the core, initializes the DMA, and enables the Smart card module transmitter and receiver.

## Smart Card driver

### Parameters

|                             |                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>             | The UART instance number.                                                                                                                                                                                                                                                       |
| <i>smartcard-StatePtr</i>   | A pointer to the Smart card driver state structure memory. The user is only responsible to pass in the memory for this run-time state structure and the Smart card driver fills out the members. This run-time state structure keeps track of the current transfer in progress. |
| <i>smartcard-UserConfig</i> | The user configuration structure of type <a href="#">smartcard_user_config_t</a> . The user is responsible to fill out the members of this structure and to pass the pointer of this structure into this function.                                                              |

### Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.30 void SMARTCARD\_UART\_DRV\_Deinit ( uint32\_t instance )

#### Parameters

|                 |                           |
|-----------------|---------------------------|
| <i>instance</i> | The UART instance number. |
|-----------------|---------------------------|

### 68.3.6.31 smartcard\_status\_t SMARTCARD\_UART\_DRV\_SendDataBlocking ( uint32\_t instance, const uint8\_t \* txBuff, uint32\_t txSize, uint32\_t timeout )

A blocking (also known as synchronous) function means that the function does not return until the transmit is complete. This blocking function is used to send data through the UART port.

#### Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The UART instance number.                                               |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send.     |
| <i>txSize</i>   | The number of bytes to send.                                            |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

### Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.32 `smartcard_status_t SMARTCARD_UART_DRV_SendData ( uint32_t instance, const uint8_t * txBuff, uint32_t txSize )`

A non-blocking (also known as synchronous) function means that the function returns immediately after initiating the transmit function. The application has to get the transmit status to see when the transmit is complete. In other words, after calling non-blocking (asynchronous) send function, the application must get the transmit status to check if transmit is complete.

Parameters

|                 |                                                                     |
|-----------------|---------------------------------------------------------------------|
| <i>instance</i> | The UART module instance number.                                    |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send. |
| <i>txSize</i>   | The number of bytes to send.                                        |

Returns

An error code or `kStatus_SMARTCARD_Success`.

### 68.3.6.33 `smartcard_status_t SMARTCARD_UART_DRV_GetTransmitStatus ( uint32_t instance, uint32_t * bytesRemaining )`

When performing an a-sync transmit, call this function to ascertain the state of the current transmission: in progress (or busy) or complete (success). If the transmission is still in progress, the user can obtain the number of words that have been transferred.

Parameters

|                        |                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The UART module instance number.                                                                           |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes that are remaining in the active transfer. |

Return values

|                                  |                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_UART_Success</i>      | The transmit has completed successfully.                                                                                                    |
| <i>kStatus_SMARTCARD_-TxBusy</i> | The transmit is still in progress. <code>bytesTransmitted</code> is filled with the number of bytes which are transmitted up to that point. |

## Smart Card driver

### 68.3.6.34 `smartcard_status_t SMARTCARD_UART_DRV_AbortSendingData ( uint32_t instance )`

During an a-sync UART transmission, the user can terminate the transmission early if the transmission is still in progress.

Parameters

|                 |                                  |
|-----------------|----------------------------------|
| <i>instance</i> | The UART module instance number. |
|-----------------|----------------------------------|

Return values

|                                               |                                           |
|-----------------------------------------------|-------------------------------------------|
| <i>kStatus_SMARTCARD_Success</i>              | The transmit was successful.              |
| <i>kStatus_SMARTCARD_NoTransmitInProgress</i> | No transmission is currently in progress. |

### 68.3.6.35 `smartcard_status_t SMARTCARD_UART_DRV_ReceiveDataBlocking ( uint32_t instance, uint8_t * rxBuff, uint32_t rxSize, uint32_t * rcvdSize, uint32_t timeout )`

A blocking (also known as synchronous) function means that the function does not return until the receive is complete. This blocking function receives data through the UART port.

Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The UART module instance number.                                        |
| <i>rxBuff</i>   | A pointer to the buffer containing 8-bit read data chars received.      |
| <i>rxSize</i>   | The number of bytes to receive.                                         |
| <i>rcvdSize</i> | The number of bytes actually received.                                  |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

**Returns**

An error code or `kStatus_SMARTCARD_Success`.

**68.3.6.36 smartcard\_status\_t SMARTCARD\_UART\_DRV\_ReceiveData ( uint32\_t *instance*, uint8\_t \* *rxBuff*, uint32\_t *rxSize* )**

A non-blocking (also known as synchronous) function means that the function returns immediately after initiating the receive function. The application has to get the receive status to see when the receive is complete. In other words, after calling non-blocking (asynchronous) get function, the application must get the receive status to check if receive is completed or not.

**Parameters**

|                 |                                                                    |
|-----------------|--------------------------------------------------------------------|
| <i>instance</i> | The UART module instance number.                                   |
| <i>rxBuff</i>   | A pointer to the buffer containing 8-bit read data chars received. |
| <i>rxSize</i>   | The number of bytes to receive.                                    |

**Returns**

An error code or `kStatus_SMARTCARD_Success`.

**68.3.6.37 smartcard\_status\_t SMARTCARD\_UART\_DRV\_GetReceiveStatus ( uint32\_t *instance*, uint32\_t \* *bytesRemaining* )**

When performing an a-sync receive, the user can call this function to ascertain the state of the current receive progress: in progress (or busy) or complete (success). In addition, if the receive is still in progress, the user can obtain the number of words that have been currently received.

**Parameters**

|                        |                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The UART module instance number.                                                                                        |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes which still need to be received in the active transfer. |

**Return values**

---

## Smart Card driver

|                                             |                                                                                                                         |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_SMARTCARD_</i><br><i>Success</i> | The receive has completed successfully.                                                                                 |
| <i>kStatus_SMARTCARD_</i><br><i>RxBusy</i>  | The receive is still in progress. bytesReceived is filled with the number of bytes which are received up to that point. |

### 68.3.6.38 `smartcard_status_t SMARTCARD_UART_DRV_AbortReceivingData ( uint32_t instance )`

During an a-sync UART receive, the user can terminate the receive early if the receive is still in progress.

Parameters

|                 |                                  |
|-----------------|----------------------------------|
| <i>instance</i> | The UART module instance number. |
|-----------------|----------------------------------|

Return values

|                                                         |                                      |
|---------------------------------------------------------|--------------------------------------|
| <i>kStatus_SMARTCARD_</i><br><i>Success</i>             | The receive was successful.          |
| <i>kStatus_SMARTCARD_</i><br><i>NoReceiveInProgress</i> | No receive is currently in progress. |

### 68.3.6.39 `smartcard_status_t SMARTCARD_UART_DRV_Control ( uint32_t instance, smartcard_control_t control, void * controlBuff )`

Parameters

|                    |                                                 |
|--------------------|-------------------------------------------------|
| <i>instance</i>    | The UART module instance number.                |
| <i>control</i>     | control type                                    |
| <i>controlBuff</i> | A pointer to parameter specific to control type |

Return values

|                                             |                                       |
|---------------------------------------------|---------------------------------------|
| <i>kStatus_SMARTCARD_</i><br><i>Success</i> | The control operation was successful. |
|---------------------------------------------|---------------------------------------|

**68.3.6.40** `smartcard_status_t SMARTCARD_DRV_DirectInit ( uint32_t interfaceInstance, smartcard_state_t * smartcardStatePtr, const smartcard_interface_config_t * interfaceUserConfig )`

Parameters

|                             |                                                                                                                                                                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-Instance</i>   | The SMARTCARD interface instance number.                                                                                                                                                                                |
| <i>smartcard-StatePtr</i>   | A pointer to the SMARTCARD driver state structure memory. The user is only responsible to pass in the memory for this run-time state structure where the SMARTCARD driver will take care of filling out the members.    |
| <i>interfaceUser-Config</i> | The user configuration structure of type <a href="#">smartcard_interface_config_t</a> . The user is responsible to fill out the members of this structure and to pass the pointer of this structure into this function. |

**68.3.6.41** `void SMARTCARD_DRV_DirectDelnit ( uint32_t instance )`

Parameters

|                 |                                   |
|-----------------|-----------------------------------|
| <i>instance</i> | smart card device instance number |
|-----------------|-----------------------------------|

**68.3.6.42** `smartcard_interface_callback_t SMARTCARD_DRV_DirectInstallCallback ( uint32_t instance, smartcard_interface_callback_t function, void * callbackParam )`

The installed callback function should be called from the interrupt service routine context of the interface device.

Parameters

|                 |                                             |
|-----------------|---------------------------------------------|
| <i>instance</i> | The SMARTCARD module instance number.       |
| <i>function</i> | Pointer to the interface callback function. |

## Smart Card driver

|                      |                                                       |
|----------------------|-------------------------------------------------------|
| <i>callbackParam</i> | Pointer to the interface callback function parameter. |
|----------------------|-------------------------------------------------------|

Return values

|                 |                                                  |
|-----------------|--------------------------------------------------|
| <i>Function</i> | pointer of the last installed callback function. |
|-----------------|--------------------------------------------------|

### 68.3.6.43 void SMARTCARD\_DRV\_DirectActivate ( uint32\_t *instance*, smartcard\_reset\_type\_t *resetType* )

Parameters

|                  |                                                                                            |
|------------------|--------------------------------------------------------------------------------------------|
| <i>instance</i>  | The SMARTCARD module instance number.                                                      |
| <i>resetType</i> | type of reset to be performed, possible values = kSmartcardColdReset, kSmartcard-WarmReset |

### 68.3.6.44 void SMARTCARD\_DRV\_DirectDeactivate ( uint32\_t *instance* )

Parameters

|                 |                                       |
|-----------------|---------------------------------------|
| <i>instance</i> | The SMARTCARD module instance number. |
| <i>slot</i>     | slot number.                          |

### 68.3.6.45 void SMARTCARD\_DRV\_DirectControl ( uint32\_t *instance*, void \* *interfaceControl*, void \* *param* )

Parameters

|                 |                                       |
|-----------------|---------------------------------------|
| <i>instance</i> | The SMARTCARD module instance number. |
| <i>slot</i>     | card slot numner.                     |

### 68.3.6.46 smartcard\_status\_t SMARTCARD\_DRV\_NCN8025Init ( uint32\_t *interfaceInstance*, smartcard\_state\_t \* *smartcardStatePtr*, const smartcard\_interface\_config\_t \* *interfaceUserConfig* )

## Parameters

|                             |                                                                                                                                                                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-Instance</i>   | The SMARTCARD interface instance number.                                                                                                                                                                                |
| <i>smartcard-StatePtr</i>   | A pointer to the SMARTCARD driver state structure memory. The user is only responsible to pass in the memory for this run-time state structure where the SMARTCARD driver will take care of filling out the members.    |
| <i>interfaceUser-Config</i> | The user configuration structure of type <a href="#">smartcard_interface_config_t</a> . The user is responsible to fill out the members of this structure and to pass the pointer of this structure into this function. |

**68.3.6.47 void SMARTCARD\_DRV\_NCN8025DeInit ( uint32\_t *instance* )**

## Parameters

|                 |                                   |
|-----------------|-----------------------------------|
| <i>instance</i> | smart card device instance number |
|-----------------|-----------------------------------|

**68.3.6.48 smartcard\_interface\_callback\_t SMARTCARD\_DRV\_NCN8025InstallCallback ( uint32\_t *instance*, smartcard\_interface\_callback\_t *function*, void \* *callbackParam* )**

The installed callback function should be called from the interrupt service routine context of the interface device.

## Parameters

|                      |                                                       |
|----------------------|-------------------------------------------------------|
| <i>instance</i>      | The SMARTCARD module instance number.                 |
| <i>function</i>      | Pointer to the interface callback function.           |
| <i>callbackParam</i> | Pointer to the interface callback function parameter. |

## Return values

|                 |                                                  |
|-----------------|--------------------------------------------------|
| <i>Function</i> | pointer of the last installed callback function. |
|-----------------|--------------------------------------------------|

**68.3.6.49 void SMARTCARD\_DRV\_NCN8025Activate ( uint32\_t *instance*, smartcard\_reset\_type\_t *resetType* )**

## Smart Card driver

Parameters

|                  |                                                                                            |
|------------------|--------------------------------------------------------------------------------------------|
| <i>instance</i>  | The SMARTCARD module instance number.                                                      |
| <i>resetType</i> | type of reset to be performed, possible values = kSmartcardColdReset, kSmartcard-WarmReset |

### 68.3.6.50 void SMARTCARD\_DRV\_NCN8025Deactivate ( uint32\_t *instance* )

Parameters

|                 |                                       |
|-----------------|---------------------------------------|
| <i>instance</i> | The SMARTCARD module instance number. |
| <i>slot</i>     | slot number.                          |

### 68.3.6.51 void SMARTCARD\_DRV\_NCN8025Control ( uint32\_t *instance*, void \* *interfaceControl*, void \* *param* )

Parameters

|                 |                                       |
|-----------------|---------------------------------------|
| <i>instance</i> | The SMARTCARD module instance number. |
| <i>slot</i>     | card slot numner.                     |

### 68.3.6.52 void SMARTCARD\_DRV\_NCN8025IRQHandler ( uint32\_t *instance* )

Parameters

|                 |                                       |
|-----------------|---------------------------------------|
| <i>instance</i> | The SMARTCARD module instance number. |
|-----------------|---------------------------------------|

## Chapter 69 System Mode Controller (SMC)

### 69.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the System Mode Controller (SMC) block of Kinetis devices.

### Modules

- [SMC HAL driver](#)

## SMC HAL driver

### 69.2 SMC HAL driver

#### 69.2.1 Overview

The section describes the programming interface of the SMC HAL driver. The System Mode Controller (SMC) sequences the system in and out of all low-power stop and run modes. Specifically, it monitors events to trigger transitions between the power modes while controlling the power, clocks, and memories of the system to achieve the power consumption and functionality of that mode. It also provides a set of functions to configure the power mode protection, the power mode, and other configuration settings.

#### 69.2.2 Power Mode Configuration APIs

The function [SMC\\_HAL\\_SetMode\(\)](#) configures the power mode based on the configuration. If it cannot switch to the target mode directly, this function performs an internal check and chooses the right path.

If an interrupt or a reset occurs during a stop entry sequence, the SMC can abort the transition early without completely entering the stop mode. The function [SMC\\_HAL\\_IsStopAbort\(\)](#) checks whether the previous stop mode entry was aborted.

To get the current power mode, use the function [SMC\\_HAL\\_GetStat\(\)](#).

This is an example of the SMC manager APIs.

```
#include "fsl_smc_hal.h"

// power mode configuration structure //
smc_power_mode_config_t smcConfig;

// power mode and option mode //
smcConfig.powerModeName = kPowerModeRun;

// set the power mode //
SMC_HAL_SetMode(&smcConfig);
```

#### 69.2.3 Power Mode Protection APIs

To configure the allowed power mode, use the function [SMC\\_HAL\\_SetProtection\(\)](#) and pass the allowed power modes. This function should only be called once after system reset.

This example shows how to use this function:

```
#include "fsl_smc_hal.h"

// Allow LLS mode and VLLS mode.
SMC_HAL_SetProtection(SMC, kAllowPowerModeLls |
 kAllowPowerModeVlls);
```

At the same time, the function [SMC\\_HAL\\_GetProtection\(\)](#) checks whether the specified modes are allowed.

## Files

- file `fsl_smc_hal.h`

## Data Structures

- struct `smc_power_mode_config_t`  
*Power mode control configuration used for calling the SMC\_SYS\_SetPowerMode API. [More...](#)*

## Enumerations

- enum `power_modes_t`

`kSmcRam2DisPowered`,  
`kSmcRam2Powered` }

*RAM2 power option.*

- enum `smc_lpo_option_t` {  
`kSmcLpoEnabled`,  
`kSmcLpoDisabled` }

*LPO power option.*

## System mode controller APIs

- `smc_hal_error_code_t` `SMC_HAL_SetMode` (`SMC_Type *base`, `const smc_power_mode_config_t *powerModeConfig`)  
*Configures the power mode.*
- static void `SMC_HAL_SetProtection` (`SMC_Type *base`, `uint8_t allowedModes`)  
*Configures all power mode protection settings.*
- static `uint8_t` `SMC_HAL_GetProtection` (`SMC_Type *base`, `uint8_t modes`)  
*Gets the power mode protection setting.*
- static `bool` `SMC_HAL_IsStopAbort` (`SMC_Type *base`)  
*Checks whether the previous stop mode entry was successful.*
- `power_mode_stat_t` `SMC_HAL_GetStat` (`SMC_Type *base`)  
*Gets the current power mode status.*

## 69.2.4 Data Structure Documentation

### 69.2.4.1 struct smc\_power\_mode\_config\_t

#### Data Fields

- [power\\_modes\\_t powerModeName](#)  
*Power mode(enum), see power\_modes\_t.*
- [smc\\_stop\\_submode\\_t stopSubMode](#)  
*Stop submode(enum), see smc\_stop\_submode\_t.*

## 69.2.5 Enumeration Type Documentation

### 69.2.5.1 enum smc\_hal\_error\_code\_t

Enumerator

- kSmcHalSuccess* Success.
- kSmcHalNoSuchModeName* Cannot find the mode name specified.
- kSmcHalAlreadyInTheState* Already in the required state.
- kSmcHalFailed* Unknown error, operation failed.

### 69.2.5.2 enum power\_mode\_stat\_t

Enumerator

- kStatRun* 0000\_0001 - Current power mode is RUN
- kStatStop* 0000\_0010 - Current power mode is STOP
- kStatVlpr* 0000\_0100 - Current power mode is VLPR
- kStatVlpw* 0000\_1000 - Current power mode is VLPW
- kStatVlps* 0001\_0000 - Current power mode is VLPS
- kStatVlls* 0100\_0000 - Current power mode is VLLS

### 69.2.5.3 enum power\_modes\_protect\_t

Enumerator

- kAllowPowerModeVlls* Allow Very-Low-Leakage Stop Mode.
- kAllowPowerModeVlp* Allow Very-Low-Power Modes.
- kAllowPowerModeAll* Allow all power modes.

## SMC HAL driver

### 69.2.5.4 enum smc\_run\_mode\_t

Enumerator

- kSmcRun* normal RUN mode
- kSmcVlpr* Very-Low-Power RUN mode.

### 69.2.5.5 enum smc\_stop\_mode\_t

Enumerator

- kSmcStop* Normal STOP mode.
- kSmcReservedStop1* Reserved.
- kSmcVlps* Very-Low-Power STOP mode.
- kSmcVlls* Very-Low-Leakage Stop mode.

### 69.2.5.6 enum smc\_stop\_submode\_t

Enumerator

- kSmcStopSub0* Stop submode 0, for VLLS0/LLS0.
- kSmcStopSub1* Stop submode 1, for VLLS1/LLS1.
- kSmcStopSub2* Stop submode 2, for VLLS2/LLS2.
- kSmcStopSub3* Stop submode 3, for VLLS3/LLS3.

### 69.2.5.7 enum smc\_lpwui\_option\_t

Enumerator

- kSmcLpwuiDisabled* Low Power Wake Up on Interrupt disabled.
- kSmcLpwuiEnabled* Low Power Wake Up on Interrupt enabled.

### 69.2.5.8 enum smc\_pstop\_option\_t

Enumerator

- kSmcPstopStop* STOP - Normal Stop mode.
- kSmcPstopStop1* Partial Stop with both system and bus clocks disabled.
- kSmcPstopStop2* Partial Stop with system clock disabled and bus clock enabled.

### 69.2.5.9 enum smc\_por\_option\_t

Enumerator

- kSmcPorEnabled* POR detect circuit is enabled in VLLS0.
- kSmcPorDisabled* POR detect circuit is disabled in VLLS0.

### 69.2.5.10 enum smc\_ram2\_option\_t

Enumerator

- kSmcRam2DisPowered* RAM2 not powered in LLS2/VLLS2.
- kSmcRam2Powered* RAM2 powered in LLS2/VLLS2.

### 69.2.5.11 enum smc\_lpo\_option\_t

Enumerator

- kSmcLpoEnabled* LPO clock is enabled in LLS/VLLSx.
- kSmcLpoDisabled* LPO clock is disabled in LLS/VLLSx.

## 69.2.6 Function Documentation

### 69.2.6.1 smc\_hal\_error\_code\_t SMC\_HAL\_SetMode ( SMC\_Type \* base, const smc\_power\_mode\_config\_t \* powerModeConfig )

This function configures the power mode base on configuration structure. If it not possible to switch to the target mode directly, this function checks internally and chooses the right path.

Parameters

|                         |                                                                            |
|-------------------------|----------------------------------------------------------------------------|
| <i>base</i>             | Base address for current SMC instance.                                     |
| <i>powerMode-Config</i> | Power mode configuration structure <a href="#">smc_power_mode_config_t</a> |

Returns

SMC error code.

## SMC HAL driver

**69.2.6.2 static void SMC\_HAL\_SetProtection ( SMC\_Type \* *base*, uint8\_t *allowedModes* ) [inline], [static]**

This function configures the power mode protection settings for supported power modes in the specified chip family. The available power modes are defined in the `power_modes_protect_t`. This should be done at an early system level initialization stage. See the reference manual for details. This register can only write once after the power reset.

The allowed modes are passed as bit map, for example, to allow LLS and VLLS, use `SMC_HAL_SetProtection(SMC, kAllowPowerModeLLs | kAllowPowerModeVlls)`. To allow all modes, use `SMC_HAL_SetProtection(SMC, kAllowPowerModeAll)`.

Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <i>base</i>         | Base address for current SMC instance. |
| <i>allowedModes</i> | Bitmap of the allowed power modes.     |

**69.2.6.3 static uint8\_t SMC\_HAL\_GetProtection ( SMC\_Type \* *base*, uint8\_t *modes* ) [inline], [static]**

This function checks whether the power modes are allowed. The modes to check are passed as a bit map, for example, to check LLS and VLLS, use `SMC_HAL_GetProtection(SMC, kAllowPowerModeLLs | kAllowPowerModeVlls)`. To test all modes, use `SMC_HAL_GetProtection(SMC, kAllowPowerModeAll)`.

Parameters

|              |                                        |
|--------------|----------------------------------------|
| <i>base</i>  | Base address for current SMC instance. |
| <i>modes</i> | Bitmap of the power modes to check.    |

Returns

Bitmap of the allowed power modes.

**69.2.6.4 static bool SMC\_HAL\_IsStopAbort ( SMC\_Type \* *base* ) [inline], [static]**

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SMC instance. |
|-------------|----------------------------------------|

Returns

The previous stop mode entry status.

Return values

|              |                                              |
|--------------|----------------------------------------------|
| <i>true</i>  | The previous stop mode entry was aborted.    |
| <i>false</i> | The previous stop mode entry was successful. |

### 69.2.6.5 `power_mode_stat_t` `SMC_HAL_GetStat ( SMC_Type * base )`

This function returns the current power mode stat. Once application switches the power mode, it should always check the stat to check whether it runs into the specified mode or not. An application should check this mode before switching to a different mode. The system requires that only certain modes can switch to other specific modes. See the reference manual for details and the `_power_mode_stat` for information about the power stat.

Parameters

|             |                                        |
|-------------|----------------------------------------|
| <i>base</i> | Base address for current SMC instance. |
|-------------|----------------------------------------|

Returns

Current power mode status.

## Chapter 70

# Serial Peripheral Interface (SPI)

### 70.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Serial Peripheral Interface (SPI) block of Kinetis L-series devices. For K- and V-series Kinetis devices, refer to the DSPI module driver.

#### Modules

- [SPI Classes](#)
- [SPI HAL driver](#)
- [SPI Master Peripheral Driver](#)
- [SPI Slave Peripheral Driver](#)
- [Shared SPI Types](#)

## SPI Classes

### 70.2 SPI Classes

This chapter describes the SPI driver C++ classes.

## 70.3 SPI HAL driver

### 70.3.1 Overview

This section describes the programming interface of the SPI HAL driver.

#### Files

- file `fsl_spi_hal.h`

#### Enumerations

- enum `spi_status_t` { ,

kSpiRxfofTxfofRxferrTxferr = 15 }
 SPI error flags.

```

## Configuration

- void **SPI\_HAL\_Init** (SPI\_Type \*base)  
*Restores the SPI to the reset configuration.*
- static void **SPI\_HAL\_Enable** (SPI\_Type \*base)  
*Enables the SPI peripheral.*
- static void **SPI\_HAL\_Disable** (SPI\_Type \*base)  
*Disables the SPI peripheral.*
- uint32\_t **SPI\_HAL\_SetBaud** (SPI\_Type \*base, uint32\_t bitsPerSec, uint32\_t sourceClockInHz)  
*Sets the SPI baud rate in bits per second.*
- static void **SPI\_HAL\_SetBaudDivisors** (SPI\_Type \*base, uint32\_t prescaleDivisor, uint32\_t rate-Divisor)  
*Configures the baud rate divisors manually.*
- static void **SPI\_HAL\_SetMasterSlave** (SPI\_Type \*base, spi\_master\_slave\_mode\_t mode)  
*Configures the SPI for master or slave.*
- static bool **SPI\_HAL\_IsMaster** (SPI\_Type \*base)  
*Returns whether the SPI module is in master mode.*
- void **SPI\_HAL\_SetSlaveSelectOutputMode** (SPI\_Type \*base, spi\_ss\_output\_mode\_t mode)  
*Sets how the slave select output operates.*
- void **SPI\_HAL\_SetDataFormat** (SPI\_Type \*base, spi\_clock\_polarity\_t polarity, spi\_clock\_phase\_t phase, spi\_shift\_direction\_t direction)  
*Sets the polarity, phase, and shift direction.*
- static uint32\_t **SPI\_HAL\_GetDataRegAddr** (SPI\_Type \*base)  
*Gets the SPI data register address for DMA operation.*
- void **SPI\_HAL\_SetPinMode** (SPI\_Type \*base, spi\_pin\_mode\_t mode)  
*Sets the SPI pin mode.*

## SPI HAL driver

### Interrupts

- void [SPI\\_HAL\\_SetIntMode](#) (SPI\_Type \*base, spi\_interrupt\_source\_t interrupt, bool enable)  
*Enables or disables the SPI interrupts.*
- static void [SPI\\_HAL\\_SetReceiveAndFaultIntCmd](#) (SPI\_Type \*base, bool enable)  
*Enables or disables the SPI receive buffer/FIFO full and mode fault interrupt.*
- static void [SPI\\_HAL\\_SetTransmitIntCmd](#) (SPI\_Type \*base, bool enable)  
*Enables or disables the SPI transmit buffer/FIFO empty interrupt.*
- static void [SPI\\_HAL\\_SetMatchIntCmd](#) (SPI\_Type \*base, bool enable)  
*Enables or disables the SPI match interrupt.*

### Status

- static bool [SPI\\_HAL\\_GetIntStatusFlag](#) (SPI\_Type \*base, spi\_int\_status\_flag\_t flag)  
*Gets the SPI interrupt status flag state.*
- static bool [SPI\\_HAL\\_IsReadBuffFullPending](#) (SPI\_Type \*base)  
*Checks whether the read buffer/FIFO is full.*
- static bool [SPI\\_HAL\\_IsTxBuffEmptyPending](#) (SPI\_Type \*base)  
*Checks whether the transmit buffer/FIFO is empty.*
- static bool [SPI\\_HAL\\_IsModeFaultPending](#) (SPI\_Type \*base)  
*Checks whether a mode fault occurred.*
- void [SPI\\_HAL\\_ClearModeFaultFlag](#) (SPI\_Type \*base)  
*Clears the mode fault flag.*
- static bool [SPI\\_HAL\\_IsMatchPending](#) (SPI\_Type \*base)  
*Checks whether the data received matches the previously-set match value.*
- void [SPI\\_HAL\\_ClearMatchFlag](#) (SPI\_Type \*base)  
*Clears the match flag.*

### Data transfer

- static uint8\_t [SPI\\_HAL\\_ReadData](#) (SPI\_Type \*base)  
*Reads a byte from the data buffer.*
- static void [SPI\\_HAL\\_WriteData](#) (SPI\_Type \*base, uint8\_t data)  
*Writes a byte into the data buffer.*
- void [SPI\\_HAL\\_WriteDataBlocking](#) (SPI\_Type \*base, uint8\_t data)  
*Writes a byte into the data buffer and waits till complete to return.*

### Match byte

- static void [SPI\\_HAL\\_SetMatchValue](#) (SPI\_Type \*base, uint8\_t matchByte)  
*Sets the value which triggers the match interrupt.*

## 70.3.2 Enumeration Type Documentation

### 70.3.2.1 enum spi\_status\_t

Enumerator

*kStatus\_SPI\_SlaveTxUnderrun* SPI Slave TX Underrun error.  
*kStatus\_SPI\_SlaveRxOverrun* SPI Slave RX Overrun error.  
*kStatus\_SPI\_Timeout* SPI transfer timed out.  
*kStatus\_SPI\_Busy* SPI instance is already busy performing a transfer.  
*kStatus\_SPI\_NoTransferInProgress* Attempt to abort a transfer when no transfer was in progress.  
*kStatus\_SPI\_OutOfRange* SPI out-of-range error used in slave callback.  
*kStatus\_SPI\_TxBufferNotEmpty* SPI TX buffer register is not empty.  
*kStatus\_SPI\_InvalidParameter* Parameter is invalid.  
*kStatus\_SPI\_NonInit* SPI driver is not initialized.  
*kStatus\_SPI\_AlreadyInitialized* SPI driver already initialized.  
*kStatus\_SPI\_DMACHannelInvalid* SPI driver cannot requests DMA channel.  
*kStatus\_SPI\_Error* SPI driver error.

### 70.3.2.2 enum spi\_master\_slave\_mode\_t

Enumerator

*kSpiMaster* SPI peripheral operates in master mode.  
*kSpiSlave* SPI peripheral operates in slave mode.

### 70.3.2.3 enum spi\_clock\_polarity\_t

Enumerator

*kSpiClockPolarity\_ActiveHigh* Active-high SPI clock (idles low).  
*kSpiClockPolarity\_ActiveLow* Active-low SPI clock (idles high).

### 70.3.2.4 enum spi\_clock\_phase\_t

Enumerator

*kSpiClockPhase\_FirstEdge* First edge on SPSCCK occurs at the middle of the first cycle of a data transfer.  
*kSpiClockPhase\_SecondEdge* First edge on SPSCCK occurs at the start of the first cycle of a data transfer.

## SPI HAL driver

### 70.3.2.5 enum spi\_shift\_direction\_t

Enumerator

*kSpiMsbFirst* Data transfers start with most significant bit.

*kSpiLsbFirst* Data transfers start with least significant bit.

### 70.3.2.6 enum spi\_ss\_output\_mode\_t

Enumerator

*kSpiSlaveSelect\_AsGpio* Slave select pin configured as GPIO.

*kSpiSlaveSelect\_FaultInput* Slave select pin configured for fault detection.

*kSpiSlaveSelect\_AutomaticOutput* Slave select pin configured for automatic SPI output.

### 70.3.2.7 enum spi\_pin\_mode\_t

Enumerator

*kSpiPinMode\_Normal* Pins operate in normal, single-direction mode.

*kSpiPinMode\_Input* Bidirectional mode. Master: MOSI pin is input; Slave: MISO pin is input

*kSpiPinMode\_Output* Bidirectional mode. Master: MOSI pin is output; Slave: MISO pin is output

### 70.3.2.8 enum spi\_data\_bitcount\_mode\_t

Enumerator

*kSpi8BitMode* 8-bit data transmission mode

*kSpi16BitMode* 16-bit data transmission mode

### 70.3.2.9 enum spi\_interrupt\_source\_t

Enumerator

*kSpiRxFullAndModfInt* Receive buffer full (SPRF) and mode fault (MODF) interrupt.

*kSpiTxEmptyInt* Transmit buffer empty interrupt.

*kSpiMatchInt* Match interrupt.

**70.3.2.10 enum spi\_int\_status\_flag\_t**

Enumerator

- kSpiRxBufferFullFlag* Read buffer full flag.
- kSpiMatchFlag* Match flag.
- kSpiTxBufferEmptyFlag* Transmit buffer empty flag.
- kSpiModeFaultFlag* Mode fault flag.

**70.3.2.11 enum spi\_fifo\_interrupt\_source\_t**

Enumerator

- kSpiRxFifoNearFullInt* Receive FIFO nearly full interrupt.
- kSpiTxFifoNearEmptyInt* Transmit FIFO nearly empty interrupt.

**70.3.2.12 enum spi\_w1c\_interrupt\_t**

Enumerator

- kSpiRxFifoFullClearInt* Receive FIFO full interrupt.
- kSpiTxFifoEmptyClearInt* Transmit FIFO empty interrupt.
- kSpiRxNearFullClearInt* Receive FIFO nearly full interrupt.
- kSpiTxNearEmptyClearInt* Transmit FIFO nearly empty interrupt.

**70.3.2.13 enum spi\_txfifo\_watermark\_t****70.3.2.14 enum spi\_rxfifo\_watermark\_t****70.3.2.15 enum spi\_fifo\_status\_flag\_t****70.3.2.16 enum spi\_fifo\_error\_flag\_t**

Enumerator

- kSpiNoFifoError* No error is detected.
- kSpiRxfof* Receive FIFO Overflow.
- kSpiTxfof* Transmit FIFO Overflow.
- kSpiRxfofTxfof* Receive FIFO Overflow, Transmit FIFO Overflow.
- kSpiRxferr* Receive FIFO Error.
- kSpiRxfofRxferr* Receive FIFO Overflow, Receive FIFO Error.
- kSpiTxfofRxferr* Transmit FIFO Overflow, Receive FIFO Error.
- kSpiRxfofTxfofRxferr* Receive FIFO Overflow, Transmit FIFO Overflow, Receive FIFO Error.

## SPI HAL driver

*kSpiTxferr* Transmit FIFO Error.

*kSpiRxfofTxferr* Receive FIFO Overflow, Transmit FIFO Error.

*kSpiTxfofTxferr* Transmit FIFO Overflow, Transmit FIFO Error.

*kSpiRxfofTxfofTxferr* Receive FIFO Overflow, Transmit FIFO Overflow, Transmit FIFO Error.

*kSpiRxferrTxferr* Receive FIFO Error, Transmit FIFO Error.

*kSpiRxfofRxferrTxferr* Receive FIFO Overflow, Receive FIFO Error, Transmit FIFO Error.

*kSpiTxfofRxferrTxferr* Transmit FIFO Overflow, Receive FIFO Error, Transmit FIFO Error.

*kSpiRxfofTxfofRxferrTxferr* Receive FIFO Overflow, Transmit FIFO Overflow Receive FIFO Error, Transmit FIFO Error.

### 70.3.3 Function Documentation

#### 70.3.3.1 void SPI\_HAL\_Init ( SPI\_Type \* base )

This function basically resets all of the SPI registers to their default setting including disabling the module.

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

#### 70.3.3.2 static void SPI\_HAL\_Enable ( SPI\_Type \* base ) [inline], [static]

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

#### 70.3.3.3 static void SPI\_HAL\_Disable ( SPI\_Type \* base ) [inline], [static]

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

#### 70.3.3.4 uint32\_t SPI\_HAL\_SetBaud ( SPI\_Type \* base, uint32\_t bitsPerSec, uint32\_t sourceClockInHz )

This function takes in the desired bitsPerSec (baud rate) and calculates the nearest possible baud rate without exceeding the desired baud rate unless the baud rate requested is less than the absolute minimum in which case the minimum baud rate is returned. The returned baud rate is in bits-per-second. It requires that the caller also provide the frequency of the module source clock (in Hertz).

## Parameters

|                         |                                           |
|-------------------------|-------------------------------------------|
| <i>base</i>             | Module base pointer of type SPI_Type.     |
| <i>bitsPerSec</i>       | The desired baud rate in bits per second. |
| <i>sourceClockIn-Hz</i> | Module source input clock in Hertz.       |

## Returns

The actual calculated baud rate in Hz.

**70.3.3.5 static void SPI\_HAL\_SetBaudDivisors ( SPI\_Type \* *base*, uint32\_t *prescaleDivisor*, uint32\_t *rateDivisor* ) [inline], [static]**

This function allows the caller to manually set the baud rate divisors in the event that these dividers are known and the caller does not wish to call the SPI\_HAL\_SetBaudRate function.

## Parameters

|                         |                                       |
|-------------------------|---------------------------------------|
| <i>base</i>             | Module base pointer of type SPI_Type. |
| <i>prescale-Divisor</i> | baud rate prescale divisor setting.   |
| <i>rateDivisor</i>      | baud rate divisor setting.            |

**70.3.3.6 static void SPI\_HAL\_SetMasterSlave ( SPI\_Type \* *base*, spi\_master\_slave\_mode\_t *mode* ) [inline], [static]**

## Parameters

|             |                                                                  |
|-------------|------------------------------------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type.                            |
| <i>mode</i> | Mode setting (master or slave) of type dspi_master_slave_mode_t. |

**70.3.3.7 static bool SPI\_HAL\_IsMaster ( SPI\_Type \* *base* ) [inline], [static]**

## SPI HAL driver

### Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

### Returns

true The module is in master mode. false The module is in slave mode.

### 70.3.3.8 void SPI\_HAL\_SetSlaveSelectOutputMode ( SPI\_Type \* *base*, spi\_ss\_output\_mode\_t *mode* )

This function allows the user to configure the slave select in one of the three operational modes: as GPIO, as a fault input, or as an automatic output for standard SPI modes.

### Parameters

|             |                                                                     |
|-------------|---------------------------------------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type.                               |
| <i>mode</i> | Selection input of one of three modes of type spi_ss_output_mode_t. |

### 70.3.3.9 void SPI\_HAL\_SetDataFormat ( SPI\_Type \* *base*, spi\_clock\_polarity\_t *polarity*, spi\_clock\_phase\_t *phase*, spi\_shift\_direction\_t *direction* )

This function configures the clock polarity, clock phase, and data shift direction.

### Parameters

|                  |                                                                  |
|------------------|------------------------------------------------------------------|
| <i>base</i>      | Module base pointer of type SPI_Type.                            |
| <i>polarity</i>  | Clock polarity setting of type spi_clock_polarity_t.             |
| <i>phase</i>     | Clock phase setting of type spi_clock_phase_t.                   |
| <i>direction</i> | Data shift direction (MSB or LSB) of type spi_shift_direction_t. |

### 70.3.3.10 static uint32\_t SPI\_HAL\_GetDataRegAddr ( SPI\_Type \* *base* ) [inline], [static]

This function gets the SPI data register address as this value is needed for DMA operation.

## Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

## Returns

The SPI data register address.

**70.3.3.11 void SPI\_HAL\_SetPinMode ( SPI\_Type \* *base*, spi\_pin\_mode\_t *mode* )**

This function configures the SPI data pins to one of three modes (of type spi\_pin\_mode\_t): Single direction mode: MOSI and MISO pins operate in normal, single direction mode. Bidirectional mode: Master: MOSI configured as input, Slave: MISO configured as input. Bidirectional mode: Master: MOSI configured as output, Slave: MISO configured as output.

## Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type.           |
| <i>mode</i> | Operational of SPI pins of type spi_pin_mode_t. |

**70.3.3.12 void SPI\_HAL\_SetIntMode ( SPI\_Type \* *base*, spi\_interrupt\_source\_t *interrupt*, bool *enable* )**

This function enables or disables the SPI receive buffer (or FIFO if the module supports a FIFO) full and mode fault interrupt, SPI transmit buffer (or FIFO if the module supports a FIFO) empty interrupt, and the SPI match interrupt.

Example, to set the receive and mode fault interrupt: SPI\_HAL\_SetIntMode(base, kSpiRxFullAndModf-Int, true);

## Parameters

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <i>base</i>      | Module base pointer of type SPI_Type.                                              |
| <i>interrupt</i> | SPI interrupt source to configure of type spi_interrupt_source_t.                  |
| <i>enable</i>    | Enable (true) or disable (false) the receive buffer full and mode fault interrupt. |

**70.3.3.13 static void SPI\_HAL\_SetReceiveAndFaultIntCmd ( SPI\_Type \* *base*, bool *enable* ) [inline], [static]**

This function enables or disables the SPI receive buffer (or FIFO if the module supports a FIFO) full and mode fault interrupt.

## SPI HAL driver

### Parameters

|               |                                                                                    |
|---------------|------------------------------------------------------------------------------------|
| <i>base</i>   | Module base pointer of type SPI_Type.                                              |
| <i>enable</i> | Enable (true) or disable (false) the receive buffer full and mode fault interrupt. |

### 70.3.3.14 static void SPI\_HAL\_SetTransmitIntCmd ( SPI\_Type \* *base*, bool *enable* ) [inline], [static]

This function enables or disables the SPI transmit buffer (or FIFO if the module supports a FIFO) empty interrupt.

### Parameters

|               |                                                                       |
|---------------|-----------------------------------------------------------------------|
| <i>base</i>   | Module base pointer of type SPI_Type.                                 |
| <i>enable</i> | Enable (true) or disable (false) the transmit buffer empty interrupt. |

### 70.3.3.15 static void SPI\_HAL\_SetMatchIntCmd ( SPI\_Type \* *base*, bool *enable* ) [inline], [static]

This function enables or disables the SPI match interrupt.

### Parameters

|               |                                                       |
|---------------|-------------------------------------------------------|
| <i>base</i>   | Module base pointer of type SPI_Type.                 |
| <i>enable</i> | Enable (true) or disable (false) the match interrupt. |

### 70.3.3.16 static bool SPI\_HAL\_GetIntStatusFlag ( SPI\_Type \* *base*, spi\_int\_status\_flag\_t *flag* ) [inline], [static]

This function returns the state (set or cleared) of the SPI interrupt status flag.

### Parameters

|             |                                                                    |
|-------------|--------------------------------------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type.                              |
| <i>flag</i> | The requested interrupt status flag of type spi_int_status_flag_t. |

Returns

Current setting of the requested interrupt status flag.

### 70.3.3.17 **static bool SPI\_HAL\_IsReadBuffFullPending ( SPI\_Type \* *base* ) [inline], [static]**

The read buffer (or FIFO if the module supports a FIFO) full flag is only cleared by reading it when it is set, then reading the data register by calling the [SPI\\_HAL\\_ReadData\(\)](#). This example code demonstrates how to check the flag, read data, and clear the flag.

```
// Check read buffer flag.
if (SPI_HAL_IsReadBuffFullPending(base))
{
 // Read the data in the buffer, which also clears the flag.
 byte = SPI_HAL_ReadData(base);
}
```

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

Returns

Current setting of the read buffer full flag.

### 70.3.3.18 **static bool SPI\_HAL\_IsTxBuffEmptyPending ( SPI\_Type \* *base* ) [inline], [static]**

To clear the transmit buffer (or FIFO if the module supports a FIFO) empty flag, read the flag when it is set. Then, write a new data value into the transmit buffer with a call to the [SPI\\_HAL\\_WriteData\(\)](#). The example code shows how to do this.

```
// Check if transmit buffer is empty.
if (SPI_HAL_IsTxBuffEmptyPending(base))
{
 // Buffer has room, so write the next data value.
 SPI_HAL_WriteData(base, byte);
}
```

## SPI HAL driver

### Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

### Returns

Current setting of the transmit buffer empty flag.

### 70.3.3.19 static bool SPI\_HAL\_IsModeFaultPending ( SPI\_Type \* *base* ) [inline], [static]

### Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

### Returns

Current setting of the mode fault flag.

### 70.3.3.20 void SPI\_HAL\_ClearModeFaultFlag ( SPI\_Type \* *base* )

### Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type |
|-------------|--------------------------------------|

### 70.3.3.21 static bool SPI\_HAL\_IsMatchPending ( SPI\_Type \* *base* ) [inline], [static]

### Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

### Returns

Current setting of the match flag.

### 70.3.3.22 void SPI\_HAL\_ClearMatchFlag ( SPI\_Type \* *base* )

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

**70.3.3.23 static uint8\_t SPI\_HAL\_ReadData ( SPI\_Type \* *base* ) [inline], [static]**

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
|-------------|---------------------------------------|

Returns

The data read from the data buffer.

**70.3.3.24 static void SPI\_HAL\_WriteData ( SPI\_Type \* *base*, uint8\_t *data* ) [inline], [static]**

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
| <i>data</i> | The data to send.                     |

**70.3.3.25 void SPI\_HAL\_WriteDataBlocking ( SPI\_Type \* *base*, uint8\_t *data* )**

This function writes data to the SPI data register and waits until the TX is empty to return.

Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>base</i> | Module base pointer of type SPI_Type. |
| <i>data</i> | The data to send.                     |

**70.3.3.26 static void SPI\_HAL\_SetMatchValue ( SPI\_Type \* *base*, uint8\_t *matchByte* ) [inline], [static]**

## SPI HAL driver

### Parameters

|                  |                                               |
|------------------|-----------------------------------------------|
| <i>base</i>      | Module base pointer of type SPI_Type.         |
| <i>matchByte</i> | The value which triggers the match interrupt. |

## 70.4 SPI Master Peripheral Driver

### 70.4.1 Overview

This chapter describes the programming interface of the SPI master mode peripheral driver. The SPI master mode peripheral driver transfers data to and from the external devices on the SPI bus in master mode. It provides an easy way to transfer buffers of data with a single function call.

The driver is separated into two implementations: interrupt-driven and DMA-driven. The interrupt-driven driver uses interrupts to alert the CPU that the SPI module needs to service the SPI data transmit and receive operations. The DMA-driven driver uses the DMA module to transfer data between the buffers located in memory and the SPI module transmit/receive buffers/FIFOs. Note that some SPI modules may not support DMA transfers and this is distinguished in the driver using the feature name "FSL\_FEATURE\_SPI\_HAS\_DMA\_SUPPORT". The interrupt-driven and DMA-driven driver APIs are distinguished by the keyword "dma" in the source file name and by the keyword "Dma" in the API name. Each set of drivers have the same API functionality and are described in the following chapters. Note that the DMA-driven driver also uses interrupts to alert the CPU that the DMA has completed its transfer or that one final piece of data still needs to be received which is handled by the IRQ handler in the DMA-driven driver. In both the interrupt and DMA drivers, the SPI module interrupts are enabled in the NVIC. In addition, the DMA driven driver requests channels from the DMA module. Also, subsequent chapters refer to either set of drivers as the "SPI master driver" when discussing items that pertain to either driver. Note, when using the DMA-driven SPI driver, initialize the DMA module. An example is shown later under the Initialization chapter.

The following is a basic step-by-step overview of how to initialize and transfer SPI data. For API specific examples, refer to the examples below. The following uses the interrupt-driven APIs and a blocking transfer to illustrate a high-level step-by-step usage. The usage of DMA driver is similar to interrupt-driven driver. Keep in mind that using interrupt and DMA drivers in the same runtime application is not normally recommended because the SPI interrupt handler needs to be changed. The interrupt driver calls SPI\_DRV\_IRQHandler() and DMA driver calls SPI\_DRV\_DmaIRQHandler(). Refer to files fsl\_spi\_irq.c and fsl\_spi\_dma\_irq.c for an example of these function calls.

```
// Init the SPI
SPI_DRV_MasterInit(masterInstance, &spiMasterState, &userConfig);
// Configure the SPI bus
SPI_DRV_MasterConfigureBus(masterInstance, &spiDevice, &calculatedBaudRate);
// Perform the transfer
SPI_DRV_MasterTransferBlocking(masterInstance, NULL, s_spiSourceBuffer,
 s_spiSinkBuffer, 32, 1000);
// Do other transfers, when done with the SPI, then de-init to shut it down
SPI_DRV_MasterDeinit(instance);
```

Note that it is not normally recommended to mix interrupt and DMA-driven drivers in the same application. However, should the user decide to do so, they can separately set up and initialize another instance for DMA operations. The user can also de-init the current interrupt-driven SPI instance and re-initialize it for DMA operations. Note that since the DMA-driven driver also uses interrupts, the user must take care to direct the IRQ handler from the vector table to the desired driver's IRQ handler. Refer to files fsl\_spi\_irq.c and fsl\_spi\_dma\_irq.c for examples on how to re-direct the IRQ handlers from the vector table to the interrupt-driven and DMA-driven driver IRQ handlers. Such files need to be included in the applications

## SPI Master Peripheral Driver

project in order to direct the SPI interrupt vectors to the proper IRQ handlers. There are also two other files, `fsl_spi_shared_function.c` and `fsl_spi_dma_shared_function.c` that direct the interrupts from the vector table to the appropriate master or slave driver interrupt handler by checking the SPI mode via the HAL function `SPI_HAL_IsMaster(baseAddr)`. Note that the interrupt driver calls `SPI_DRV_IRQHandler()` and DMA driver calls `SPI_DRV_DmaIRQHandler()`. Refer to files `fsl_spi_irq.c` and `fsl_spi_dma_irq.c` for an example of these function calls.

### 70.4.2 SPI Run-time state structures

The SPI master driver uses a run-time state structure to track the ongoing data transfers. The state structure for the interrupt-driven driver is called `spi_master_state_t` while the state structure for the DMA-driven driver is called `spi_dma_master_state_t`. This structure holds data that the SPI master peripheral driver uses to communicate between the transfer function and the interrupt handler and other driver functions. The interrupt handler in the interrupt-driven driver also uses this information to keep track of its progress. The user is only required to pass the memory for the run-time state structure. The SPI master driver populates the members.

### 70.4.3 SPI Device structures

The SPI master driver uses instances of the `spi_device_t` or `spi_dma_device_t` structure to represent the SPI bus configuration required to communicate to an external device that is connected to the bus.

The device structure can be passed into the `SPI_DRV_MasterConfigureBus` or `SPI_DRV_DmaMasterConfigureBus` functions to manually configure the bus for a particular device. For example, if there is only one device connected to the bus, the user might configure it only once. Alternatively the device structure can be passed to the data transfer functions where the bus is reconfigured before the transfer is started. The device structure consists of the following settings: bitsPerSec (baud rate in Hz), bit count (if the SPI module supports both 8- and 16-bit transfers), clock polarity and phase, and data shift direction (msb or lsb).

### 70.4.4 SPI Initialization

To initialize the SPI master driver, call the `SPI_DRV_MasterInit()` or `SPI_DRV_DmaMasterInit()` function and pass the instance number of the SPI peripheral you want to use. For example, to use the SPI1 module, pass a value 1 to the initialization function. In addition, the user also passes in the pointer to the run-time state structure used by the master driver to keep track of data transfers.

The user first calls the SPI master initialization to initialize the SPI module, then calls the SPI master configuration bus to configure the module for the specific device on the SPI bus. For the interrupt-driven case, while the `SPI_DRV_MasterInit()` function initializes the SPI peripheral, the `SPI_DRV_MasterConfigureBus()` function configures the SPI bus parameters such as bits/frame, clock characteristics, data shift direction, and baud rate. The DMA-driven case follows the same logic (except that it uses the DMA API

names) and both examples are provided below. First, the interrupt-driven example is provided followed by the DMA example.

Example code to initialize and configure the SPI master interrupt-driven driver including setting up the user configuration and device structures:

```
// Set up and init the master //
uint32_t calculatedBaudRate;
uint32_t masterInstance = 1; // example using SPI instance 1
spi_master_state_t spiMasterState; // simply allocate memory for this

// configure the members of the user config //
spi_master_user_config_t userConfig;
userConfig.polarity = kSpiClockPolarity_ActiveHigh;
userConfig.phase = kSpiClockPhase_FirstEdge;
userConfig.direction = kSpiMsbFirst;
userConfig.bitsPerSec = 5000; // 5KHz baud rate
#if FSL_FEATURE_SPI_16BIT_TRANSFERS
userConfig.bitCount= kSpi8BitMode; // set only if SPI module supports bit count feature
#endif
// init the SPI module //
SPI_DRV_MasterInit(masterInstance, &spiMasterState);

// configure the SPI bus //
SPI_DRV_MasterConfigureBus(masterInstance, &userConfig, &calculatedBaudRate);
```

Example code to initialize and configure the SPI master DMA-driven driver including setting up the user configuration and device structures. Note that some SPI modules may not support DMA transfers and this is distinguished in the driver using the feature name "FSL\_FEATURE\_SPI\_HAS\_DMA\_SUPPORT".

```
#if FSL_FEATURE_SPI_HAS_DMA_SUPPORT
// First, need to init the DMA peripheral driver.
// NOTE: THIS IS NOT PART OF THE SPI DRIVER. THIS PART INITIALIZES THE DMA DRIVER SO
// THAT THE SPI DMA DRIVER CAN WORK!
dma_state_t state; // <- The user simply allocates memory for this structure.
DMA_DRV_Init(&state);

// Set up and init the master //
uint32_t calculatedBaudRate;
uint32_t masterInstance = 0; // example using SPI instance 0
spi_dma_master_state_t spiDmaMasterState; // simply allocate memory for this

// configure the members of the user config //
spi_dma_master_user_config_t userDmaConfig;
userDmaConfig.polarity = kSpiClockPolarity_ActiveHigh;
userDmaConfig.phase = kSpiClockPhase_FirstEdge;
userDmaConfig.direction = kSpiMsbFirst;
userDmaConfig.bitsPerSec = 5000; // 5KHz baud rate
#if FSL_FEATURE_SPI_16BIT_TRANSFERS
userDmaConfig.bitCount= kSpi8BitMode; // set only if SPI module supports bit count feature
#endif
// init the SPI module //
SPI_DRV_DmaMasterInit(masterInstance, &spiDmaMasterState);

// configure the SPI bus //
SPI_DRV_DmaMasterConfigureBus(masterInstance, &userDmaConfig, &
calculatedBaudRate);
#endif
```

## SPI Master Peripheral Driver

### 70.4.5 SPI Transfers

The driver supports two different modes to transfer data: blocking and non-blocking. The blocking transfer function waits until the transfer is complete before returning. A timeout parameter is passed into the blocking function. A non-blocking (async) function returns immediately after starting the transfer. It is the responsibility of the user to get the transfer status during the transfer to ascertain when the transfer is complete. As such, additional functions are provided to aid in non-blocking transfers: get transfer status and abort transfer.

Note that some SPI modules may not support DMA transfers.

Blocking transfer function APIs (interrupt and DMA-driven):

```
spi_status_t SPI_DRV_MasterTransferBlocking(uint32_t instance,
 const spi_master_user_config_t *
 restrict device,
 const uint8_t * restrict sendBuffer,
 uint8_t * restrict receiveBuffer,
 size_t transferByteCount,
 uint32_t timeout);

spi_status_t SPI_DRV_DmaMasterTransferBlocking(uint32_t
 instance,
 const
 spi_dma_master_user_config_t * restrict device,
 const uint8_t * restrict sendBuffer,
 uint8_t * restrict receiveBuffer,
 size_t transferByteCount,
 uint32_t timeout);
```

Non-blocking function APIs and associated functions (interrupt and DMA-driven):

```
// interrupt-driven transfer function
spi_status_t SPI_DRV_MasterTransfer(uint32_t instance,
 const spi_master_user_config_t * restrict device,
 const uint8_t * restrict sendBuffer,
 uint8_t * restrict receiveBuffer,
 size_t transferByteCount);

// Returns whether the previous transfer is completed (interrupt-driven)
spi_status_t SPI_DRV_MasterGetTransferStatus(uint32_t instance,
 uint32_t * bytesTransferred);

// Terminates an asynchronous transfer early (interrupt-driven)
spi_status_t SPI_DRV_MasterAbortTransfer(uint32_t instance);

// DMA-driven transfer function
spi_status_t SPI_DRV_DmaMasterTransfer(uint32_t instance,
 const spi_dma_master_user_config_t *
 restrict device,
 const uint8_t * restrict sendBuffer,
 uint8_t * restrict receiveBuffer,
 size_t transferByteCount);

// Returns whether the previous transfer is completed (DMA-driven)
spi_status_t SPI_DRV_DmaMasterGetTransferStatus(uint32_t
 instance, uint32_t * bytesTransferred);

// Terminates an asynchronous transfer early (DMA-driven)
spi_status_t SPI_DRV_DmaMasterAbortTransfer(uint32_t instance);
```

Example of a blocking transfer (interrupt and DMA-driven). Note, first need to initialize the peripheral driver. Refer to the Initialization chapter to perform this first before transferring.

```
// Example blocking transfer function call (interrupt)
// Note: providing another device structure is optional and for this example, we'll assume the call
// to the SPI_DRV_MasterConfigureBus was sufficient, so we'll pass in NULL for the device structure.
// Also, this example shows that we're transferring 32 bytes with a timeout of 1000us.
SPI_DRV_MasterTransferBlocking(masterInstance, NULL, s_spiSourceBuffer,
 s_spiSinkBuffer, 32, 1000);

// Example blocking transfer function call (DMA)
// Note: providing another device structure is optional and for this example, we'll assume the call
// to the SPI_DRV_DmaMasterConfigureBus was sufficient, so we'll pass in NULL for the device
// structure. Also, this example shows that we're transferring 32 bytes with a timeout of 1000us.
SPI_DRV_DmaMasterTransferBlocking(masterInstance, NULL, s_spiSourceBuffer,
 s_spiSinkBuffer,
 32, 1000);
```

Example of a non-blocking transfer (interrupt and DMA-driven). Note, first need to initialize the peripheral driver. Refer to the Initialization chapter to perform this first before transferring:

```
// Interrupt Example

uint32_t bytesXfer;

// Example non-blocking transfer function call
// Note: providing another device structure is optional and for this example, we'll assume the call
// to the SPI_DRV_MasterConfigureBus was sufficient, so we'll pass in NULL for the device structure.
// Also, this example shows that we're transferring 32 bytes.
SPI_DRV_MasterTransfer(masterInstance, NULL, s_spiSourceBuffer, s_spiSinkBuffer, 32);

// For non-blocking/async transfers, need to check back to get transfer status, for example
// Where bytesXfer returns the number of bytes transferred
SPI_DRV_MasterGetTransferStatus(masterInstance, &bytesXfer);

// Additionally, if for some reason we need to terminate the on-going transfer:
SPI_DRV_MasterAbortTransfer(masterInstance);

// DMA Example
// Example non-blocking transfer function call
// Note: providing another device structure is optional and for this example, we'll assume the call
// to the SPI_DRV_DmaMasterConfigureBus was sufficient, so we'll pass in NULL for the device
// structure. Also, this example shows that we're transferring 32 bytes.
SPI_DRV_DmaMasterTransfer(masterInstance, NULL, s_spiSourceBuffer, s_spiSinkBuffer
 , 32);

// For non-blocking/async transfers, need to check back to get transfer status, for example
// Where bytesXfer returns the number of bytes transferred
SPI_DRV_DmaMasterGetTransferStatus(masterInstance, &bytesXfer);

// Additionally, if for some reason we need to terminate the on-going transfer:
SPI_DRV_DmaMasterAbortTransfer(masterInstance);
```

## 70.4.6 SPI De-initialization

To de-initialize and shut down the SPI module, call the function:

```
// interrupt-driven
```

## SPI Master Peripheral Driver

```
void SPI_DRV_MasterDeinit(masterInstance);

// DMA-driven
void SPI_DRV_DmaMasterDeinit(masterInstance);
```

### 70.4.8 Enumeration Type Documentation

#### 70.4.8.1 `enum _spi_dma_timeouts`

Enumerator

`kSpiDmaWaitForever` Waits forever for a transfer to complete.

### 70.4.8.2 enum \_spi\_timeouts

Enumerator

*kSpiWaitForever* Waits forever for a transfer to complete.

## 70.4.9 Function Documentation

### 70.4.9.1 spi\_status\_t SPI\_DRV\_DmaMasterInit ( uint32\_t instance, spi\_dma\_master\_state\_t \* spiDmaState )

This function uses a DMA-driven method for transferring data. This function initializes the run-time state structure to track the ongoing transfers, un-gates the clock to the SPI module, resets the SPI module, initializes the module to user defined settings and default settings, configures the IRQ state structure, enables the module-level interrupt to the core, and enables the SPI module.

This initialization function also configures the DMA module by requesting channels for DMA operation.

Parameters

|                    |                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>    | The instance number of the SPI peripheral.                                                                                                                                                                                                        |
| <i>spiDmaState</i> | The pointer to the SPI DMA master driver state structure. The user must pass the memory for this run-time state structure and the SPI master driver fills out the members. This run-time state structure keeps track of the transfer in progress. |

Returns

kStatus\_SPI\_Success indicating successful initialization

### 70.4.9.2 spi\_status\_t SPI\_DRV\_DmaMasterDeinit ( uint32\_t instance )

This function resets the SPI peripheral, gates its clock, disables any used interrupts to the core, and releases any used DMA channels.

Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

Returns

kStatus\_SPI\_Success indicating successful de-initialization

## SPI Master Peripheral Driver

### 70.4.9.3 void SPI\_DRV\_DmaMasterConfigureBus ( uint32\_t *instance*, const spi\_dma\_master\_user\_config\_t \* *device*, uint32\_t \* *calculatedBaudRate* )

The term "device" is used to indicate the SPI device for which the SPI master is communicating. The user has two options to configure the device parameters: either pass in the pointer to the device configuration structure to the desired transfer function or pass it in to the SPI\_DRV\_DmaMasterConfigureBus function. The user can pass in a device structure to the transfer function which contains the parameters for the bus (the transfer function then calls this function). However, the user has the option to call this function directly especially to get the calculated baud rate, at which point they may pass in NULL for the device structure in the transfer function (assuming they have called this configure bus function first).

#### Parameters

|                            |                                                                                                                                                                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>            | The instance number of the SPI peripheral.                                                                                                                                                                                                                                                            |
| <i>device</i>              | Pointer to the device information structure. This structure contains the settings for SPI bus configurations.                                                                                                                                                                                         |
| <i>calculated-BaudRate</i> | The calculated baud rate passed back to the user to determine if the calculated baud rate is close enough to meet the needs. The baud rate never exceeds the desired baud rate unless the baud rate requested is less than the absolute minimum in which case the minimum baud rate will be returned. |

### 70.4.9.4 spi\_status\_t SPI\_DRV\_DmaMasterTransferBlocking ( uint32\_t *instance*, const spi\_dma\_master\_user\_config\_t \* *device*, const uint8\_t \* *sendBuffer*, uint8\_t \* *receiveBuffer*, size\_t *transferByteCount*, uint32\_t *timeout* )

This function simultaneously sends and receives data on the SPI bus, as SPI is naturally a full-duplex bus. The function does return until the transfer is complete.

#### Parameters

|                   |                                                                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>   | The instance number of the SPI peripheral.                                                                                                                                                                                               |
| <i>device</i>     | Pointer to the device information structure. This structure contains the settings for the SPI bus configuration for this transfer. You may pass NULL for this parameter, in which case the current bus configuration is used unmodified. |
| <i>sendBuffer</i> | Buffer of data to send. You may pass NULL for this parameter, in which case bytes with a value of 0 (zero) are sent.                                                                                                                     |

|                           |                                                                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>receiveBuffer</i>      | Buffer where received bytes are stored. If you pass NULL for this parameter, the received bytes are ignored.                                                                            |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                                                                                                                                                |
| <i>timeout</i>            | A timeout for the transfer in microseconds. If the transfer takes longer than this amount of time, the transfer is aborted and a <a href="#">kStatus_SPI_Timeout</a> error is returned. |

### Returns

[#kStatus\\_Success](#) The transfer was successful. [kStatus\\_SPI\\_Busy](#) Cannot perform another transfer because one is already in progress. [kStatus\\_SPI\\_Timeout](#) The transfer timed out and was aborted.

#### 70.4.9.5 `spi_status_t SPI_DRV_DmaMasterTransfer ( uint32_t instance, const spi_dma_master_user_config_t * device, const uint8_t * sendBuffer, uint8_t * receiveBuffer, size_t transferByteCount )`

This function returns immediately. It is the user's responsibility to check back to ascertain if the transfer is complete (using the `SPI_DRV_DmaMasterGetTransferStatus` function). This function simultaneously sends and receives data on the SPI bus, as SPI is naturally a full-duplex bus. The function does not return until the transfer is complete.

### Parameters

|                           |                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>           | The instance number of the SPI peripheral.                                                                                                                                                                                               |
| <i>device</i>             | Pointer to the device information structure. This structure contains the settings for the SPI bus configuration for this transfer. You may pass NULL for this parameter, in which case the current bus configuration is used unmodified. |
| <i>sendBuffer</i>         | Buffer of data to send. You may pass NULL for this parameter, in which case bytes with a value of 0 (zero) is sent.                                                                                                                      |
| <i>receiveBuffer</i>      | Buffer where received bytes are stored. If you pass NULL for this parameter, the received bytes are ignored.                                                                                                                             |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                                                                                                                                                                                                 |

### Returns

[#kStatus\\_Success](#) The transfer was successful. [kStatus\\_SPI\\_Busy](#) Cannot perform another transfer because one is already in progress. [kStatus\\_SPI\\_Timeout](#) The transfer timed out and was aborted.

## SPI Master Peripheral Driver

### 70.4.9.6 spi\_status\_t SPI\_DRV\_DmaMasterGetTransferStatus ( uint32\_t instance, uint32\_t \* bytesTransferred )

When performing an a-sync transfer, the user can call this function to ascertain the state of the current transfer: in progress (or busy) or complete (success). In addition, if the transfer is still in progress, the user can get the number of words that have been transferred up to now.

#### Parameters

|                          |                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------|
| <i>instance</i>          | The instance number of the SPI peripheral.                                                          |
| <i>bytes-Transferred</i> | Pointer to a value that is filled in with the number of bytes that were sent in the active transfer |

#### Returns

kStatus\_Success The transfer has completed successfully. kStatus\_SPI\_Busy The transfer is still in progress. *bytesTransferred* is filled with the number of bytes that have been transferred so far.

### 70.4.9.7 spi\_status\_t SPI\_DRV\_DmaMasterAbortTransfer ( uint32\_t instance )

During an a-sync transfer, the user has the option to terminate the transfer early if the transfer is still in progress.

#### Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

#### Returns

kStatus\_SPI\_Success The transfer was successful. kStatus\_SPI\_NoTransferInProgress No transfer is currently in progress.

### 70.4.9.8 void SPI\_DRV\_DmaMasterIRQHandler ( uint32\_t instance )

This handler is used when the extraByte flag is set to retrieve the received last byte.

#### Parameters

---

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

### 70.4.9.9 **spi\_status\_t SPI\_DRV\_MasterInit ( uint32\_t *instance*, spi\_master\_state\_t \* *spiState* )**

This function uses a CPU interrupt driven method for transferring data. It initializes the run-time state structure to track the ongoing transfers, un-gates the clock to the SPI module, resets and initializes the module to default settings, configures the IRQ state structure, enables the module-level interrupt to the core, and enables the SPI module.

Parameters

|                 |                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral.                                                                                                                                                                                                |
| <i>spiState</i> | The pointer to the SPI master driver state structure. The user passes the memory for the run-time state structure and the SPI master driver populates the members. This run-time state structure keeps track of the transfer in progress. |

Returns

kStatus\_SPI\_Success indicating successful initialization

### 70.4.9.10 **spi\_status\_t SPI\_DRV\_MasterDeinit ( uint32\_t *instance* )**

This function resets the SPI peripheral, gates its clock, and disables the interrupt to the core.

Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

Returns

kStatus\_SPI\_Success indicating successful de-initialization

### 70.4.9.11 **void SPI\_DRV\_MasterConfigureBus ( uint32\_t *instance*, const spi\_master\_user\_config\_t \* *device*, uint32\_t \* *calculatedBaudRate* )**

The term "device" is used to indicate the SPI device for which the SPI master is communicating. The user has two options to configure the device parameters: either pass in the pointer to the device configuration structure to the desired transfer function (see SPI\_DRV\_MasterTransferDataBlocking or SPI\_DRV\_MasterTransferData) or pass it in to the SPI\_DRV\_MasterConfigureBus function. The user can pass in a device structure to the transfer function which contains the parameters for the bus (the transfer function

---

## SPI Master Peripheral Driver

then calls this function). However, the user has the option to call this function directly especially to get the calculated baud rate, at which point they may pass in NULL for the device structure in the transfer function (assuming they have called this configure bus function first).

### Parameters

|                            |                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>            | The instance number of the SPI peripheral.                                                                                                                                                                                                                                                       |
| <i>device</i>              | Pointer to the device information structure. This structure contains the settings for SPI bus configurations.                                                                                                                                                                                    |
| <i>calculated-BaudRate</i> | The calculated baud rate passed back to the user to determine if the calculated baud rate is close enough to meet the needs. The baud rate never exceeds the desired baud rate unless the baud rate requested is less than the absolute minimum in which case the minimum baud rate is returned. |

#### 70.4.9.12 `spi_status_t SPI_DRV_MasterTransferBlocking ( uint32_t instance, const spi_master_user_config_t * device, const uint8_t * sendBuffer, uint8_t * receiveBuffer, size_t transferByteCount, uint32_t timeout )`

This function simultaneously sends and receives data on the SPI bus, because the SPI is a full-duplex bus, and does not return until the transfer is complete.

### Parameters

|                           |                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>           | The instance number of the SPI peripheral.                                                                                                                                                                                               |
| <i>device</i>             | Pointer to the device information structure. This structure contains the settings for the SPI bus configuration for this transfer. You may pass NULL for this parameter, in which case the current bus configuration is used unmodified. |
| <i>sendBuffer</i>         | Buffer of data to send. You may pass NULL for this parameter, in which case bytes with a value of 0 (zero) are sent.                                                                                                                     |
| <i>receiveBuffer</i>      | Buffer where received bytes are stored. If you pass NULL for this parameter, the received bytes are ignored.                                                                                                                             |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                                                                                                                                                                                                 |
| <i>timeout</i>            | A timeout for the transfer in microseconds. If the transfer takes longer than this amount of time, the transfer is aborted and a <code>kStatus_SPI_Timeout</code> error is returned.                                                     |

## SPI Master Peripheral Driver

### Returns

`#kStatus_Success` The transfer was successful. `kStatus_SPI_Busy` Cannot perform another transfer because one is already in progress. `kStatus_SPI_Timeout` The transfer timed out and was aborted.

### 70.4.9.13 `spi_status_t SPI_DRV_MasterTransfer ( uint32_t instance, const spi_master_user_config_t * device, const uint8_t * sendBuffer, uint8_t * receiveBuffer, size_t transferByteCount )`

This function returns immediately. The user should check back to find out if the transfer is complete (using the `SPI_DRV_MasterGetTransferStatus` function). This function simultaneously sends and receives data on the SPI bus, because the SPI is a full-duplex bus, and does not return until the transfer is complete.

### Parameters

|                           |                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>           | The instance number of the SPI peripheral.                                                                                                                                                                                               |
| <i>device</i>             | Pointer to the device information structure. This structure contains the settings for the SPI bus configuration for this transfer. You may pass NULL for this parameter, in which case the current bus configuration is used unmodified. |
| <i>sendBuffer</i>         | Buffer of data to send. You may pass NULL for this parameter, in which case bytes with a value of 0 (zero) is sent.                                                                                                                      |
| <i>receiveBuffer</i>      | Buffer where received bytes are stored. If you pass NULL for this parameter, the received bytes are ignored.                                                                                                                             |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                                                                                                                                                                                                 |

### Returns

`#kStatus_Success` The transfer was successful. `kStatus_SPI_Busy` Cannot perform another transfer because one is already in progress. `kStatus_SPI_Timeout` The transfer timed out and was aborted.

### 70.4.9.14 `spi_status_t SPI_DRV_MasterGetTransferStatus ( uint32_t instance, uint32_t * bytesTransferred )`

When performing an a-sync transfer, calling this function shows the state of the current transfer: in progress (or busy) or complete (success). In addition, if the transfer is still in progress, the user can get the number of words that have been transferred up to now.

### Parameters

|                          |                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------|
| <i>instance</i>          | The instance number of the SPI peripheral.                                                          |
| <i>bytes-Transferred</i> | Pointer to a value that is filled in with the number of bytes that were sent in the active transfer |

### Returns

kStatus\_Success The transfer has completed successfully. kStatus\_SPI\_Busy The transfer is still in progress. *bytesTransferred* is filled with the number of bytes that have been transferred so far.

#### 70.4.9.15 spi\_status\_t SPI\_DRV\_MasterAbortTransfer ( uint32\_t instance )

During an a-sync transfer, the user has the option to terminate the transfer early if the transfer is still in progress.

### Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

### Returns

kStatus\_SPI\_Success The transfer was successful. kStatus\_SPI\_NoTransferInProgress No transfer is currently in progress.

#### 70.4.9.16 void SPI\_DRV\_MasterIRQHandler ( uint32\_t instance )

This handler uses the buffers stored in the [spi\\_master\\_state\\_t](#) structs to transfer data.

### Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

## SPI Slave Peripheral Driver

### 70.5 SPI Slave Peripheral Driver

#### 70.5.1 Overview

This section describes the programming interface of the SPI slave mode peripheral driver.

#### 70.5.2 SPI Overview

The SPI slave peripheral driver provides an easy way to use an SPI peripheral in slave mode. It supports transferring buffers of data with a single function call. When the SPI is configured for slave mode operations, it must first be set up to perform a transfer and then wait for the master to initiate the transfer. The driver is separated into two implementations: interrupt-driven and DMA-driven. The interrupt-driven driver uses interrupts to alert the CPU that the SPI module needs to service the SPI data transmit and receive operations. The DMA-driven driver uses the DMA module to transfer data between the buffers located in memory and the SPI module transmit/receive buffers/FIFOs. Note that some SPI modules may not support DMA transfers and this is distinguished in the driver using the feature name "FSL\_FEATURE\_SPI\_HAS\_DMA\_SUPPORT". The interrupt-driven and DMA-driven driver APIs are distinguished by the keyword "dma" in the source file name and by the keyword "Dma" in the API name. Each set of drivers have the same API functionality and are described in the following chapters. Note that the DMA-driven driver also uses interrupts to alert the CPU that the DMA has completed its transfer or that one final piece of data still needs to be received which is handled by the IRQ handler in the DMA-driven driver. In both the interrupt and DMA drivers, the SPI module interrupts are enabled in the NVIC. In addition, the DMA-driven driver requests channels from the DMA module. Also, subsequent chapters refer to either set of drivers simply as the "SPI slave driver" when discussing items that pertain to either driver. Note, when using the DMA-driven SPI driver, initialize the DMA module. An example is shown later under the Initialization chapter. The following is a basic step-by-step overview of how to setup the SPI for SPI slave mode operations. For API specific examples, refer to the examples below. The following uses the interrupt-driven APIs and a blocking transfer to illustrate a high-level step-by-step usage. The usage of DMA driver is similar to interrupt-driven driver. Keep in mind that using interrupt and DMA drivers in the same runtime application is not normally recommended because the SPI interrupt handler needs to be changed. The interrupt driver calls `SPI_DRV_IRQHandler()` and DMA driver calls `SPI_DRV_DmaIRQHandler()`. Refer to files `fsl_spi_irq.c` and `fsl_spi_dma_irq.c` for an example of these function calls.

```
// Init the SPI
SPI_DRV_SlaveInit(slaveInstance, &spiSlaveState, &userConfig);
// Perform the transfer (however, waits for master to initiate the transfer)
SPI_DRV_SlaveTransferBlocking(slaveInstance, s_spiSourceBuffer,
 s_spiSinkBuffer, 32, 1000);
// Do other transfers, when done with the SPI, then de-init to shut it down
SPI_DRV_SlaveDeinit(instance);
```

Note that it is not normally recommended to mix interrupt and DMA-driven drivers in the same application. However, should the user decide to do so, they can separately set up and initialize another instance for DMA operations. The user can also de-init the current interrupt-driven SPI instance and re-initialize it for DMA operations. Note that since the DMA-driven driver also uses interrupts, the user must take

care to direct the IRQ handler from the vector table to the desired driver's IRQ handler. Refer to files `fsl_spi_irq.c` and `fsl_spi_dma_irq.c` for examples on how to re-direct the IRQ handlers from the vector table to the interrupt-driven and DMA-driven driver IRQ handlers. Such files need to be included in the applications project in order to direct the SPI interrupt vectors to the proper IRQ handlers. There are also two other files, `fsl_spi_shared_function.c` and `fsl_spi_dma_shared_function.c` that direct the interrupts from the vector table to the appropriate master or slave driver interrupt handler by checking the SPI mode via the HAL function `SPI_HAL_IsMaster(baseAddr)`.

### 70.5.3 SPI Runtime state of the SPI slave driver

The SPI slave driver uses a run-time state structure to track the ongoing data transfers. The state structure for the interrupt-driven driver is called `spi_slave_state_t` while the state structure for the DMA-driven driver is called `spi_dma_slave_state_t`. The structure holds data that the SPI slave peripheral driver uses to communicate between the transfer function and the interrupt handler and other driver functions. The interrupt handler also uses this information to keep track of its progress. The user is only responsible to pass the memory for this run-time state structure and the SPI slave driver fills out the members.

### 70.5.4 SPI User configuration structures

The SPI slave driver uses instances of the user configuration structure for the SPI slave driver. The user configuration structure for the interrupt-driven driver is called `spi_slave_user_config_t` while the user configuration structure for the DMA-driven driver is called `spi_dma_slave_user_config_t`. For this reason, the user can configure the most common settings of the SPI peripheral with a single function call.

### 70.5.5 SPI Setup and Initialization

To initialize the SPI slave driver, first create and fill in a `spi_slave_user_config_t` structure for the interrupt-driven driver or `spi_dma_slave_user_config_t` structure for the DMA-driven driver. This structure defines the data format settings for the SPI peripheral. The structure is not required after the driver is initialized and can be allocated on the stack. The user also must pass the memory for the run-time state structure. Note that some SPI modules may not support DMA transfers and this is distinguished in the driver using the feature name "FSL\_FEATURE\_SPI\_HAS\_DMA\_SUPPORT".

This is an example code to initialize and configure the driver for interrupt and DMA operations:

```
// declare which module instance you want to use
uint32_t instance = 1;

// interrupt-driven
spi_slave_state_t spiSlaveState;
// update configs
spi_slave_user_config_t slaveUserConfig;
slaveUserConfig.direction = kSpiMsbFirst;
slaveUserConfig.polarity = kSpiClockPolarity_ActiveHigh;
slaveUserConfig.phase = kSpiClockPhase_FirstEdge;
slaveUserConfig.dummyPattern = SPI_DEFAULT_DUMMY_PATTERN;
```

## SPI Slave Peripheral Driver

```

#if FSL_FEATURE_SPI_16BIT_TRANSFERS
 slaveUserConfig.bitCount = kSpi8BitMode;
#endif

 // init the slave (interrupt-driven)
 SPI_DRV_SlaveInit(instance, &spiSlaveState, &slaveUserConfig);

#if FSL_FEATURE_SPI_HAS_DMA_SUPPORT
 // DMA-driven
 // First set up the DMA peripheral
 dma_state_t state; // <- The user simply allocates memory for this structure.
 DMA_DRV_Init(&state);

 // DMA-driven
 spi_dma_slave_state_t spiDmaSlaveState;
 // update configs
 spi_dma_slave_user_config_t slaveDmaUserConfig;
 slaveDmaUserConfig.direction = kSpiMsbFirst;
 slaveDmaUserConfig.polarity = kSpiClockPolarity_ActiveHigh;
 slaveDmaUserConfig.phase = kSpiClockPhase_FirstEdge;
 slaveDmaUserConfig.dummyPattern = SPI_DEFAULT_DUMMY_PATTERN;
#endif
#if FSL_FEATURE_SPI_16BIT_TRANSFERS
 slaveDmaUserConfig.bitCount = kSpi8BitMode;
#endif

 // init the slave (DMA-driven)
 SPI_DRV_DmaSlaveInit(instance, &spiDmaSlaveState, &slaveDmaUserConfig);
#endif

```

### 70.5.6 SPI Blocking and non-blocking

The SPI slave driver has two types of transfer functions, blocking and non-blocking calls. With non-blocking calls, the user starts the transfer and then waits for event flags are set. `kSpiTransferDone` indicates the transmission and reception are done. With the blocking call, the function only returns after the related process is all done.

Here is an example of blocking and non-blocking call (interrupt-driven)

```

spi_status_t result;
// Blocking call example
result = SPI_DRV_SlaveTransferBlocking(instance, // number of SPI peripheral
 sendBuffer, // pointer to transmit buffer, can be NULL
 receiveBuffer, // pointer to receive buffer, can be NULL
 transferSize, // size of receive and receive data
 10000); // Time out after 10000ms

// Check the result to know that transferring success or not.

// Non-blocking call example
result = SPI_DRV_SlaveTransfer(instance, // number of SPI peripheral
 sendBuffer, // pointer to transmit buffer, can be NULL
 receiveBuffer, // pointer to receive buffer, can be NULL
 transferSize); // size of receive and receive data

// Wait for transfer done
while(kStatus_SPI_Success != SPI_DRV_SlaveGetTransferStatus(instance, NULL));
// Must check the value of osaStatus to know that transferring success or not.

```

Additionally, some SPI modules support DMA transfers. To use the SPI with DMA, see the following example:

```

spi_status_t result;
// Blocking call example
result = SPI_DRV_DmaSlaveTransferBlocking(instance, // number of SPI
 peripheral
 sendBuffer, // pointer to transmit buffer, can be NULL
 receiveBuffer, // pointer to receive buffer, can be NULL
 transferSize, // size of receive and receive data
 10000); // Time out after 10000ms
// Check the result to know that transferring success or not.

// Non-blocking call example
result = SPI_DRV_DmaSlaveTransfer(instance, // number of SPI peripheral
 sendBuffer, // pointer to transmit buffer, can be NULL
 receiveBuffer, // pointer to receive buffer, can be NULL
 transferSize); // size of receive and receive data

// Wait for transfer done
while(kStatus_SPI_Success != SPI_DRV_DmaSlaveGetTransferStatus(instance,
 NULL));
// Must check the value of osaStatus to know that transferring success or not.

```

### 70.5.7 SPI De-initialization

To de-initialize and shut down the SPI module, call the function:

```

// interrupt-driven
void SPI_DRV_SlaveDeinit(masterInstance);

// DMA-driven
void SPI_DRV_DmaSlaveDeinit(masterInstance);

```

## SPI Slave Peripheral Driver

### 70.5.8.4.0.8 Field Documentation

70.5.8.4.0.8.1 `volatile bool spi_slave_state_t::isTransferInProgress`

70.5.8.4.0.8.2 `volatile int32_t spi_slave_state_t::remainingSendByteCount`

70.5.8.4.0.8.3 `volatile int32_t spi_slave_state_t::remainingReceiveByteCount`

70.5.8.4.0.8.4 `volatile int32_t spi_slave_state_t::transferredByteCount`

### 70.5.9 Function Documentation

**70.5.9.1 `spi_status_t SPI_DRV_DmaSlaveInit ( uint32_t instance, spi_dma_slave_state_t * spiState, const spi_dma_slave_user_config_t * slaveConfig )`**

This function un-gates the clock to the SPI module, initializes the SPI for slave mode. Once initialized, the SPI module is configured in slave mode and user can start transmit, receive data by calls send, receive, transfer functions. This function indicates SPI slave uses an interrupt mechanism.

Parameters

|                    |                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| <i>instance</i>    | The instance number of the SPI peripheral.                                                                |
| <i>spiState</i>    | The pointer to the SPI slave driver state structure.                                                      |
| <i>slaveConfig</i> | The configuration structure <a href="#">spi_slave_user_config_t</a> which configures the data bus format. |

Returns

An error code or `kStatus_SPI_Success`.

**70.5.9.2 `spi_status_t SPI_DRV_DmaSlaveDeinit ( uint32_t instance )`**

Disables the SPI module, gates its clock, change SPI slave driver state to NonInit for SPI slave module which is initialized with interrupt mechanism. After de-initialized, user can re-initialize SPI slave module with other mechanisms.

Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

Returns

kStatus\_SPI\_Success indicating successful de-initialization

### 70.5.9.3 spi\_status\_t SPI\_DRV\_DmaSlaveTransferBlocking ( uint32\_t *instance*, const uint8\_t \* *sendBuffer*, uint8\_t \* *receiveBuffer*, uint32\_t *transferByteCount*, uint32\_t *timeout* )

This function check driver status, mechanism and transmit/receive data through SPI bus. If sendBuffer is NULL, transmit process is ignored. If the receiveBuffer is NULL, the receive process is ignored. If both the receiveBuffer and the sendBuffer are available, the transmit and the receive progress are processed. If only the receiveBuffer available, the receive is processed. Otherwise, the transmit is processed. This function returns when its processes are completed. This function uses interrupt mechanism.

Parameters

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <i>instance</i>           | The instance number of SPI peripheral                                            |
| <i>sendBuffer</i>         | The pointer to data that user wants to transmit.                                 |
| <i>receiveBuffer</i>      | The pointer to data that user wants to store received data.                      |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                                         |
| <i>timeout</i>            | The maximum number of milliseconds that function waits before timed out reached. |

Returns

kStatus\_SPI\_Success if driver starts to send/receive data successfully. kStatus\_SPI\_Error if driver is error and needs to clean error. kStatus\_SPI\_Busy if driver is receiving/transmitting data and not available. kStatus\_SPI\_Timeout if time out reached while transferring is in progress.

### 70.5.9.4 spi\_status\_t SPI\_DRV\_DmaSlaveTransfer ( uint32\_t *instance*, const uint8\_t \* *sendBuffer*, uint8\_t \* *receiveBuffer*, uint32\_t *transferByteCount* )

This function checks the driver status then set buffer pointers to receive and transmit SPI data. If the sendBuffer is NULL, the transmit process is ignored. If the receiveBuffer is NULL, the receive process is ignored. If both the receiveBuffer and the sendBuffer available, transfer is done when the kDspiTxDone and kDspiRxDone are set. If only the receiveBuffer is available, the transfer is done when the kDspiRxDone flag is set. Otherwise, the transfer is done when the kDspiTxDone was set. This function uses an interrupt mechanism.

## SPI Slave Peripheral Driver

### Parameters

|                           |                                                             |
|---------------------------|-------------------------------------------------------------|
| <i>instance</i>           | The instance number of SPI peripheral                       |
| <i>sendBuffer</i>         | The pointer to data that user wants to transmit.            |
| <i>receiveBuffer</i>      | The pointer to data that user wants to store received data. |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                    |

### Returns

kStatus\_SPI\_Success if driver starts to send/receive data successfully. kStatus\_SPI\_Error if driver is error and needs to clean error. kStatus\_SPI\_Busy if driver is receiving/transmitting data and not available.

### 70.5.9.5 spi\_status\_t SPI\_DRV\_DmaSlaveAbortTransfer ( uint32\_t instance )

This function stops the transfer which was started by the [SPI\\_DRV\\_SlaveTransfer\(\)](#) function.

### Parameters

|                 |                                       |
|-----------------|---------------------------------------|
| <i>instance</i> | The instance number of SPI peripheral |
|-----------------|---------------------------------------|

### Returns

kStatus\_SPI\_Success if everything is OK. kStatus\_SPI\_InvalidMechanism if the current transaction does not use interrupt mechanism.

### 70.5.9.6 spi\_status\_t SPI\_DRV\_DmaSlaveGetTransferStatus ( uint32\_t instance, uint32\_t \* framesTransferred )

When performing an a-sync transfer, the user can call this function to ascertain the state of the current transfer: in progress (or busy) or complete (success). In addition, if the transfer is still in progress, the user can get the number of words that have been transferred up to now.

### Parameters

---

|                           |                                                                                                                                                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>           | The instance number of the SPI peripheral.                                                                                                                   |
| <i>frames-Transferred</i> | Pointer to value that is filled in with the number of frames that have been sent in the active transfer. A frame is defined as the number of bits per frame. |

### Returns

kStatus\_SPI\_Success The transfer has completed successfully, or kStatus\_SPI\_Busy The transfer is still in progress. framesTransferred is filled with the number of words that have been transferred so far.

### 70.5.9.7 void SPI\_DRV\_DmaSlaveIRQHandler ( uint32\_t *instance* )

This handler is used when the hasExtraByte flag is set to retrieve the received last byte.

### Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

### 70.5.9.8 spi\_status\_t SPI\_DRV\_SlaveInit ( uint32\_t *instance*, spi\_slave\_state\_t \* *spiState*, const spi\_slave\_user\_config\_t \* *slaveConfig* )

This function un-gates the clock to the SPI module, initializes the SPI for slave mode. After it is initialized, the SPI module is configured in slave mode and the user can start transmitting and receiving data by calling send, receive, and transfer functions. This function indicates SPI slave uses an interrupt mechanism.

### Parameters

|                    |                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| <i>instance</i>    | The instance number of the SPI peripheral.                                                                |
| <i>spiState</i>    | The pointer to the SPI slave driver state structure.                                                      |
| <i>slaveConfig</i> | The configuration structure <a href="#">spi_slave_user_config_t</a> which configures the data bus format. |

### Returns

An error code or kStatus\_SPI\_Success.

### 70.5.9.9 spi\_status\_t SPI\_DRV\_SlaveDeinit ( uint32\_t *instance* )

Disables the SPI module, gates its clock, and changes the SPI slave driver state to NonInit for the SPI slave module which is initialized with interrupt mechanism. After de-initialization, the user can re-initialize the SPI slave module with other mechanisms.

## SPI Slave Peripheral Driver

### Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>instance</i> | The instance number of the SPI peripheral. |
|-----------------|--------------------------------------------|

### Returns

An error code or `kStatus_SPI_Success`.

#### 70.5.9.10 `spi_status_t SPI_DRV_SlaveTransferBlocking ( uint32_t instance, const uint8_t * sendBuffer, uint8_t * receiveBuffer, uint32_t transferByteCount, uint32_t timeout )`

This function checks the driver status and mechanism, and transmits/receives data through the SPI bus. If the `sendBuffer` is NULL, the transmit process is ignored. If the `receiveBuffer` is NULL, the receive process is ignored. If both the `receiveBuffer` and the `sendBuffer` are available, the transmit and the receive progress is processed. If only the `receiveBuffer` is available, the receive is processed. Otherwise, the transmit is processed. This function only returns when the processes are completed. This function uses an interrupt mechanism.

### Parameters

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <i>instance</i>           | The instance number of SPI peripheral                                            |
| <i>sendBuffer</i>         | The pointer to data that user wants to transmit.                                 |
| <i>receiveBuffer</i>      | The pointer to data that user wants to store received data.                      |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                                         |
| <i>timeout</i>            | The maximum number of milliseconds that function waits before timed out reached. |

### Returns

`kStatus_SPI_Success` if driver starts to send/receive data successfully. `kStatus_SPI_Error` if driver is error and needs to clean error. `kStatus_SPI_Busy` if driver is receiving/transmitting data and not available. `kStatus_SPI_Timeout` if time out reached while transferring is in progress.

#### 70.5.9.11 `spi_status_t SPI_DRV_SlaveTransfer ( uint32_t instance, const uint8_t * sendBuffer, uint8_t * receiveBuffer, uint32_t transferByteCount )`

This function checks the driver status and sets buffer pointers to receive and transmit SPI data. If the `sendBuffer` is NULL, the transmit process is ignored. If the `receiveBuffer` is NULL, the receive process is ignored. If both the `receiveBuffer` and the `sendBuffer` are available, the transfer is done when the `kDspi-TxDone` and `kDspiRxDone` are set. If only the `receiveBuffer` is available, the transfer is done when the `kDspiRxDone` flag is set. Otherwise, the transfer is done when the `kDspiTxDone` was set. This function uses an interrupt mechanism.

### Parameters

|                           |                                                             |
|---------------------------|-------------------------------------------------------------|
| <i>instance</i>           | The instance number of SPI peripheral                       |
| <i>sendBuffer</i>         | The pointer to data that user wants to transmit.            |
| <i>receiveBuffer</i>      | The pointer to data that user wants to store received data. |
| <i>transferByte-Count</i> | The number of bytes to send and receive.                    |

### Returns

kStatus\_SPI\_Success if driver starts to send/receive data successfully. kStatus\_SPI\_Error if driver is error and needs to clean error. kStatus\_SPI\_Busy if driver is receiving/transmitting data and not available.

#### 70.5.9.12 spi\_status\_t SPI\_DRV\_SlaveAbortTransfer ( uint32\_t *instance* )

This function stops the transfer which was started by the calling the [SPI\\_DRV\\_SlaveTransfer\(\)](#) function.

### Parameters

|                 |                                       |
|-----------------|---------------------------------------|
| <i>instance</i> | The instance number of SPI peripheral |
|-----------------|---------------------------------------|

### Returns

kStatus\_SPI\_Success if everything is OK. kStatus\_SPI\_InvalidMechanism if the current transaction does not use interrupt mechanism.

#### 70.5.9.13 spi\_status\_t SPI\_DRV\_SlaveGetTransferStatus ( uint32\_t *instance*, uint32\_t \* *framesTransferred* )

When performing an a-sync transfer, the user can call this function to ascertain the state of the current transfer: in progress (or busy) or complete (success). In addition, if the transfer is still in progress, the user can get the number of words that have been transferred up to now.

### Parameters

---

## SPI Slave Peripheral Driver

|                           |                                                                                                                                                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>           | The instance number of the SPI peripheral.                                                                                                                   |
| <i>frames-Transferred</i> | Pointer to value that is filled in with the number of frames that have been sent in the active transfer. A frame is defined as the number of bits per frame. |

### Returns

kStatus\_SPI\_Success The transfer has completed successfully, or kStatus\_SPI\_Busy The transfer is still in progress. framesTransferred is filled with the number of words that have been transferred so far.

### 70.5.9.14 void SPI\_DRV\_SlaveIRQHandler ( uint32\_t *instance* )

#### Parameters

|                 |                                    |
|-----------------|------------------------------------|
| <i>instance</i> | Instance number of the SPI module. |
|-----------------|------------------------------------|

## 70.5.10 Variable Documentation

70.5.10.1 SPI\_Type\* const g\_spiBase[SPI\_INSTANCE\_COUNT]

70.5.10.2 const IRQn\_Type g\_spilrqld[SPI\_INSTANCE\_COUNT]

70.5.10.3 SPI\_Type\* const g\_spiBase[SPI\_INSTANCE\_COUNT]

70.5.10.4 const IRQn\_Type g\_spilrqld[SPI\_INSTANCE\_COUNT]

## **70.6 Shared SPI Types**

This chapter describes SPI driver shared types.

---

## Shared SPI Types

## Chapter 71

### Timer/PWM Module (TPM)

#### 71.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Timer/PWM (TPM) Module of Kinetis devices.

#### Modules

- [TPM HAL driver](#)
- [TPM Peripheral driver](#)

## TPM HAL driver

### 71.2 TPM HAL driver

#### 71.2.1 Overview

The section describes the programming interface of the TPM HAL driver.

#### Data Structures

- struct `tpm_pwm_param_t`  
*TPM driver PWM parameter. [More...](#)*

#### Enumerations

- enum `tpm_clock_mode_t`  
*TPM clock source selection for TPM\_SC[CMOD].*
- enum `tpm_counting_mode_t`  
*TPM counting mode, up or down.*
- enum `tpm_clock_ps_t`  
*TPM prescaler factor selection for clock source.*
- enum `tpm_trigger_source_t` {  
`kTpmTrigSel0 = 0,`  
`kTpmTrigSel1,`  
`kTpmTrigSel2,`  
`kTpmTrigSel3,`  
`kTpmTrigSel4,`  
`kTpmTrigSel5,`  
`kTpmTrigSel6,`  
`kTpmTrigSel7,`  
`kTpmTrigSel8,`  
`kTpmTrigSel9,`  
`kTpmTrigSel10,`  
`kTpmTrigSel11,`  
`kTpmTrigSel12,`  
`kTpmTrigSel13,`  
`kTpmTrigSel14,`  
`kTpmTrigSel15 }`  
*TPM trigger sources, please refer to the chip reference manual for available options.*
- enum `tpm_pwm_mode_t` {  
`kTpmEdgeAlignedPWM = 0,`  
`kTpmCenterAlignedPWM }`  
*TPM operation mode.*
- enum `tpm_pwm_edge_mode_t` {  
`kTpmHighTrue = 0,`  
`kTpmLowTrue }`  
*TPM PWM output pulse mode, high-true or low-true on match up.*

- enum `tpm_input_capture_mode_t`  
*TPM input capture modes.*
- enum `tpm_output_compare_mode_t`  
*TPM output compare modes.*
- enum `tpm_status_t` {  
`kStatusTpmSuccess = 0x00U`,  
`kStatusTpmFail = 0x01U` }  
*Error codes for TPM driver.*

## Functions

- void `TPM_HAL_Reset` (TPM\_Type \*base, uint32\_t instance)  
*Resets the TPM registers.*
- void `TPM_HAL_EnablePwmMode` (TPM\_Type \*base, `tpm_pwm_param_t` \*config, uint8\_t channel)  
*Enables the TPM PWM output mode.*
- void `TPM_HAL_DisableChn` (TPM\_Type \*base, uint8\_t channel)  
*Disables the TPM channel.*
- void `TPM_HAL_SetClockMode` (TPM\_Type \*base, `tpm_clock_mode_t` mode)  
*Sets the TPM clock mode.*
- static `tpm_clock_mode_t` `TPM_HAL_GetClockMode` (TPM\_Type \*base)  
*get TPM clock mode.*
- static void `TPM_HAL_SetClockDiv` (TPM\_Type \*base, `tpm_clock_ps_t` ps)  
*Sets the TPM clock divider.*
- static `tpm_clock_ps_t` `TPM_HAL_GetClockDiv` (TPM\_Type \*base)  
*Gets the TPM clock divider.*
- static void `TPM_HAL_EnableTimerOverflowInt` (TPM\_Type \*base)  
*Enables the TPM peripheral timer overflow interrupt.*
- static void `TPM_HAL_DisableTimerOverflowInt` (TPM\_Type \*base)  
*Disables the TPM peripheral timer overflow interrupt.*
- static bool `TPM_HAL_IsOverflowIntEnabled` (TPM\_Type \*base)  
*Reads the bit that controls TPM timer overflow interrupt enablement.*
- static bool `TPM_HAL_GetTimerOverflowStatus` (TPM\_Type \*base)  
*Returns the TPM peripheral timer overflow interrupt flag.*
- static void `TPM_HAL_ClearTimerOverflowFlag` (TPM\_Type \*base)  
*Clears the TPM timer overflow interrupt flag.*
- static void `TPM_HAL_SetCpwms` (TPM\_Type \*base, uint8\_t mode)  
*set TPM center-aligned PWM select.*
- static bool `TPM_HAL_GetCpwms` (TPM\_Type \*base)  
*Gets the TPM center-aligned PWM selection value.*
- static void `TPM_HAL_ClearCounter` (TPM\_Type \*base)  
*Clears the TPM peripheral current counter value.*
- static uint16\_t `TPM_HAL_GetCounterVal` (TPM\_Type \*base)  
*Returns the TPM peripheral current counter value.*
- static void `TPM_HAL_SetMod` (TPM\_Type \*base, uint16\_t val)  
*Sets the TPM peripheral timer modulo value.*
- static uint16\_t `TPM_HAL_GetMod` (TPM\_Type \*base)  
*Returns the TPM peripheral counter modulo value.*
- static void `TPM_HAL_SetChnMsnbaElsnbaVal` (TPM\_Type \*base, uint8\_t channel, uint8\_t value)

## TPM HAL driver

- Sets the TPM peripheral timer channel mode and edge level.*

  - static uint8\_t [TPM\\_HAL\\_GetChnMsnbaVal](#) (TPM\_Type \*base, uint8\_t channel)

*Gets the TPM peripheral timer channel mode.*

  - static uint8\_t [TPM\\_HAL\\_GetChnElsnbaVal](#) (TPM\_Type \*base, uint8\_t channel)

*Gets the TPM peripheral timer channel edge level.*

  - static void [TPM\\_HAL\\_EnableChnInt](#) (TPM\_Type \*base, uint8\_t channel)

*Enables the TPM peripheral timer channel(n) interrupt.*

  - static void [TPM\\_HAL\\_DisableChnInt](#) (TPM\_Type \*base, uint8\_t channel)

*Disables the TPM peripheral timer channel(n) interrupt.*

  - static bool [TPM\\_HAL\\_IsChnIntEnabled](#) (TPM\_Type \*base, uint8\_t channel)

*Gets the TPM peripheral timer channel(n) interrupt enabled or not.*

  - static bool [TPM\\_HAL\\_GetChnStatus](#) (TPM\_Type \*base, uint8\_t channel)

*Returns whether any event for TPM peripheral timer channel has occurred.*

  - static void [TPM\\_HAL\\_ClearChnInt](#) (TPM\_Type \*base, uint8\_t channel)

*Returns whether any event for the TPM peripheral timer channel has occurred.*

  - static void [TPM\\_HAL\\_SetChnCountVal](#) (TPM\_Type \*base, uint8\_t channel, uint16\_t val)

*Sets the TPM peripheral timer channel counter value.*

  - static uint16\_t [TPM\\_HAL\\_GetChnCountVal](#) (TPM\_Type \*base, uint8\_t channel)

*Gets the TPM peripheral timer channel counter value.*

  - static uint32\_t [TPM\\_HAL\\_GetStatusRegVal](#) (TPM\_Type \*base)

*Gets the TPM peripheral timer channel event status.*

  - static void [TPM\\_HAL\\_ClearStatusReg](#) (TPM\_Type \*base, uint16\_t tpm\_status)

*Clears the TPM peripheral timer clear status register value.*

  - static void [TPM\\_HAL\\_SetTriggerSrc](#) (TPM\_Type \*base, [tpm\\_trigger\\_source\\_t](#) trigger\_num)

*Sets the TPM peripheral timer trigger.*

  - static void [TPM\\_HAL\\_SetTriggerMode](#) (TPM\_Type \*base, bool enable)

*Sets the TPM peripheral timer running on trigger or not.*

  - static void [TPM\\_HAL\\_SetReloadOnTriggerMode](#) (TPM\_Type \*base, bool enable)

*Enables the TPM timer counter reload on selected trigger or not.*

  - static void [TPM\\_HAL\\_SetStopOnOverflowMode](#) (TPM\_Type \*base, bool enable)

*Enables the TPM timer counter stop on selected trigger or not.*

  - static void [TPM\\_HAL\\_EnableGlobalTimeBase](#) (TPM\_Type \*base, bool enable)

*Enables the TPM timer global time base.*

  - static void [TPM\\_HAL\\_SetDbgMode](#) (TPM\_Type \*base, bool enable)

*Sets BDM mode.*

  - static void [TPM\\_HAL\\_SetWaitMode](#) (TPM\_Type \*base, bool enable)

*Sets the WAIT mode behavior.*

## Variables

- const uint32\_t [g\\_tpmChannelCount](#) [TPM\_INSTANCE\_COUNT]
- Table of number of channels for each TPM instance.*

## 71.2.2 Data Structure Documentation

### 71.2.2.1 struct tpm\_pwm\_param\_t

#### Data Fields

- [tpm\\_pwm\\_mode\\_t mode](#)  
*TPM PWM operation mode.*
- [tpm\\_pwm\\_edge\\_mode\\_t edgeMode](#)  
*PWM output mode.*
- [uint32\\_t uFrequencyHZ](#)  
*PWM period in Hz.*
- [uint32\\_t uDutyCyclePercent](#)  
*PWM pulse width, value should be between 0 to 100 0=inactive signal(0% duty cycle)...*

#### 71.2.2.1.0.9 Field Documentation

##### 71.2.2.1.0.9.1 uint32\_t tpm\_pwm\_param\_t::uDutyCyclePercent

100=active signal (100% duty cycle).

## 71.2.3 Enumeration Type Documentation

### 71.2.3.1 enum tpm\_clock\_mode\_t

### 71.2.3.2 enum tpm\_trigger\_source\_t

Enumerator

- kTpmTrigSel0* TPM trigger source 0.
- kTpmTrigSel1* TPM trigger source 1.
- kTpmTrigSel2* TPM trigger source 2.
- kTpmTrigSel3* TPM trigger source 3.
- kTpmTrigSel4* TPM trigger source 4.
- kTpmTrigSel5* TPM trigger source 5.
- kTpmTrigSel6* TPM trigger source 6.
- kTpmTrigSel7* TPM trigger source 7.
- kTpmTrigSel8* TPM trigger source 8.
- kTpmTrigSel9* TPM trigger source 8.
- kTpmTrigSel10* TPM trigger source 10.
- kTpmTrigSel11* TPM trigger source 11.
- kTpmTrigSel12* TPM trigger source 12.
- kTpmTrigSel13* TPM trigger source 13.
- kTpmTrigSel14* TPM trigger source 14.
- kTpmTrigSel15* TPM trigger source 15.

## TPM HAL driver

### 71.2.3.3 enum tpm\_pwm\_mode\_t

Enumerator

*kTpmEdgeAlignedPWM* Edge aligned mode.  
*kTpmCenterAlignedPWM* Center aligned mode.

### 71.2.3.4 enum tpm\_pwm\_edge\_mode\_t

Enumerator

*kTpmHighTrue* Clear output on match, set output on reload.  
*kTpmLowTrue* Set output on match, clear output on reload.

### 71.2.3.5 enum tpm\_status\_t

Enumerator

*kStatusTpmSuccess* TPM success status.  
*kStatusTpmFail* TPM error status.

## 71.2.4 Function Documentation

### 71.2.4.1 void TPM\_HAL\_Reset ( TPM\_Type \* *base*, uint32\_t *instance* )

Parameters

|                 |                                     |
|-----------------|-------------------------------------|
| <i>base</i>     | TPM module base address pointer     |
| <i>instance</i> | The TPM peripheral instance number. |

### 71.2.4.2 void TPM\_HAL\_EnablePwmMode ( TPM\_Type \* *base*, tpm\_pwm\_param\_t \* *config*, uint8\_t *channel* )

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

|                |                             |
|----------------|-----------------------------|
| <i>config</i>  | PWM configuration parameter |
| <i>channel</i> | The TPM channel number.     |

**71.2.4.3 void TPM\_HAL\_DisableChn ( TPM\_Type \* *base*, uint8\_t *channel* )**

Parameters

|                |                                 |
|----------------|---------------------------------|
| <i>base</i>    | TPM module base address pointer |
| <i>channel</i> | The TPM channel number.         |

**71.2.4.4 void TPM\_HAL\_SetClockMode ( TPM\_Type \* *base*, tpm\_clock\_mode\_t *mode* )**

When disabling the TPM counter, the function waits till it receives an acknowledge from the TPM clock domain.

Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>base</i> | TPM module base address pointer      |
| <i>mode</i> | The TPM counter clock mode (source). |

**71.2.4.5 static tpm\_clock\_mode\_t TPM\_HAL\_GetClockMode ( TPM\_Type \* *base* )  
[inline], [static]**

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

Returns

The TPM counter clock mode (source).

**71.2.4.6 static void TPM\_HAL\_SetClockDiv ( TPM\_Type \* *base*, tpm\_clock\_ps\_t *ps* )  
[inline], [static]**

## TPM HAL driver

### Parameters

|             |                                           |
|-------------|-------------------------------------------|
| <i>base</i> | TPM module base address pointer           |
| <i>ps</i>   | The TPM peripheral clock prescale divider |

**71.2.4.7** `static tpm_clock_ps_t TPM_HAL_GetClockDiv ( TPM_Type * base ) [inline], [static]`

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

### Returns

The TPM peripheral clock prescale divider.

**71.2.4.8** `static void TPM_HAL_EnableTimerOverflowInt ( TPM_Type * base ) [inline], [static]`

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

**71.2.4.9** `static void TPM_HAL_DisableTimerOverflowInt ( TPM_Type * base ) [inline], [static]`

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

**71.2.4.10** `static bool TPM_HAL_IsOverflowIntEnabled ( TPM_Type * base ) [inline], [static]`

### Parameters

---

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

Returns

true if overflow interrupt is enabled, false if not

**71.2.4.11 static bool TPM\_HAL\_GetTimerOverflowStatus ( TPM\_Type \* *base* )  
[inline], [static]**

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

Returns

true if overflow, false if not

**71.2.4.12 static void TPM\_HAL\_ClearTimerOverflowFlag ( TPM\_Type \* *base* )  
[inline], [static]**

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

**71.2.4.13 static void TPM\_HAL\_SetCpwms ( TPM\_Type \* *base*, uint8\_t *mode* )  
[inline], [static]**

Parameters

|             |                                              |
|-------------|----------------------------------------------|
| <i>base</i> | TPM module base address pointer              |
| <i>mode</i> | 1 : upcounting mode 0:up_down counting mode. |

**71.2.4.14 static bool TPM\_HAL\_GetCpwms ( TPM\_Type \* *base* ) [inline], [static]**

## TPM HAL driver

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

### Returns

Whether the TPM center-aligned PWM is selected or not.

**71.2.4.15** `static void TPM_HAL_ClearCounter ( TPM_Type * base ) [inline], [static]`

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

**71.2.4.16** `static uint16_t TPM_HAL_GetCounterVal ( TPM_Type * base ) [inline], [static]`

### Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

### Returns

current TPM timer counter value

**71.2.4.17** `static void TPM_HAL_SetMod ( TPM_Type * base, uint16_t val ) [inline], [static]`

### Parameters

|             |                                         |
|-------------|-----------------------------------------|
| <i>base</i> | TPM module base address pointer         |
| <i>val</i>  | The value to be set to the timer modulo |

**71.2.4.18** `static uint16_t TPM_HAL_GetMod ( TPM_Type * base ) [inline], [static]`

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

Returns

TPM timer modula value

**71.2.4.19 static void TPM\_HAL\_SetChnMsnbaElsnbaVal ( TPM\_Type \* *base*, uint8\_t *channel*, uint8\_t *value* ) [inline], [static]**

TPM channel operate mode, MSnB, and ELSnBA should be set at the same time.

Parameters

|                |                                       |
|----------------|---------------------------------------|
| <i>base</i>    | The TPM base address                  |
| <i>channel</i> | The TPM peripheral channel number     |
| <i>value</i>   | The value to set for MSnBA and ELSnBA |

**71.2.4.20 static uint8\_t TPM\_HAL\_GetChnMsnbaVal ( TPM\_Type \* *base*, uint8\_t *channel* ) [inline], [static]**

Parameters

|                |                                   |
|----------------|-----------------------------------|
| <i>base</i>    | TPM module base address pointer   |
| <i>channel</i> | The TPM peripheral channel number |

Returns

The MSnB:MSnA mode value, will be 00,01, 10, 11

**71.2.4.21 static uint8\_t TPM\_HAL\_GetChnElsnbaVal ( TPM\_Type \* *base*, uint8\_t *channel* ) [inline], [static]**

## TPM HAL driver

### Parameters

|                |                                   |
|----------------|-----------------------------------|
| <i>base</i>    | TPM module base address pointer   |
| <i>channel</i> | The TPM peripheral channel number |

### Returns

The ELSnB:ELSnA mode value, will be 00,01, 10, 11

**71.2.4.22** `static void TPM_HAL_EnableChnInt ( TPM_Type * base, uint8_t channel )`  
**[inline], [static]**

### Parameters

|                |                                   |
|----------------|-----------------------------------|
| <i>base</i>    | TPM module base address pointer   |
| <i>channel</i> | The TPM peripheral channel number |

**71.2.4.23** `static void TPM_HAL_DisableChnInt ( TPM_Type * base, uint8_t channel )`  
**[inline], [static]**

### Parameters

|                |                                   |
|----------------|-----------------------------------|
| <i>base</i>    | TPM module base address pointer   |
| <i>channel</i> | The TPM peripheral channel number |

**71.2.4.24** `static bool TPM_HAL_IsChnIntEnabled ( TPM_Type * base, uint8_t channel )`  
**[inline], [static]**

### Parameters

|                |                                   |
|----------------|-----------------------------------|
| <i>base</i>    | TPM module base address pointer   |
| <i>channel</i> | The TPM peripheral channel number |

### Returns

Whether the TPM peripheral timer channel(n) interrupt is enabled or not.

**71.2.4.25** `static bool TPM_HAL_GetChnStatus ( TPM_Type * base, uint8_t channel )`  
**[inline], [static]**

Parameters

|                |                                    |
|----------------|------------------------------------|
| <i>base</i>    | TPM module base address pointer    |
| <i>channel</i> | The TPM peripheral channel number. |

Returns

true if event occurred, false otherwise

**71.2.4.26 static void TPM\_HAL\_ClearChnInt ( TPM\_Type \* *base*, uint8\_t *channel* ) [inline], [static]**

Parameters

|                |                                    |
|----------------|------------------------------------|
| <i>base</i>    | TPM module base address pointer    |
| <i>channel</i> | The TPM peripheral channel number. |

**71.2.4.27 static void TPM\_HAL\_SetChnCountVal ( TPM\_Type \* *base*, uint8\_t *channel*, uint16\_t *val* ) [inline], [static]**

Parameters

|                |                                    |
|----------------|------------------------------------|
| <i>base</i>    | TPM module base address pointer    |
| <i>channel</i> | The TPM peripheral channel number. |
| <i>val</i>     | counter value to be set            |

**71.2.4.28 static uint16\_t TPM\_HAL\_GetChnCountVal ( TPM\_Type \* *base*, uint8\_t *channel* ) [inline], [static]**

Parameters

|                |                                    |
|----------------|------------------------------------|
| <i>base</i>    | TPM module base address pointer    |
| <i>channel</i> | The TPM peripheral channel number. |

## TPM HAL driver

Returns

The TPM timer channel counter value.

**71.2.4.29** `static uint32_t TPM_HAL_GetStatusRegVal ( TPM_Type * base ) [inline], [static]`

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | TPM module base address pointer |
|-------------|---------------------------------|

Returns

The TPM timer channel event status.

**71.2.4.30** `static void TPM_HAL_ClearStatusReg ( TPM_Type * base, uint16_t tpm_status ) [inline], [static]`

Parameters

|                   |                                       |
|-------------------|---------------------------------------|
| <i>base</i>       | TPM module base address pointer       |
| <i>tpm_status</i> | TPM channel or overflow flag to clear |

**71.2.4.31** `static void TPM_HAL_SetTriggerSrc ( TPM_Type * base, tpm_trigger_source_t trigger_num ) [inline], [static]`

Parameters

|                    |                                 |
|--------------------|---------------------------------|
| <i>base</i>        | TPM module base address pointer |
| <i>trigger_num</i> | 0-15                            |

**71.2.4.32** `static void TPM_HAL_SetTriggerMode ( TPM_Type * base, bool enable ) [inline], [static]`

Parameters

|               |                                 |
|---------------|---------------------------------|
| <i>base</i>   | TPM module base address pointer |
| <i>enable</i> | true to enable, 1 to enable     |

**71.2.4.33 static void TPM\_HAL\_SetReloadOnTriggerMode ( TPM\_Type \* *base*, bool *enable* ) [inline], [static]**

Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>base</i>   | TPM module base address pointer   |
| <i>enable</i> | true to enable, false to disable. |

**71.2.4.34 static void TPM\_HAL\_SetStopOnOverflowMode ( TPM\_Type \* *base*, bool *enable* ) [inline], [static]**

Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>base</i>   | TPM module base address pointer   |
| <i>enable</i> | true to enable, false to disable. |

**71.2.4.35 static void TPM\_HAL\_EnableGlobalTimeBase ( TPM\_Type \* *base*, bool *enable* ) [inline], [static]**

Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>base</i>   | TPM module base address pointer   |
| <i>enable</i> | true to enable, false to disable. |

**71.2.4.36 static void TPM\_HAL\_SetDbgMode ( TPM\_Type \* *base*, bool *enable* ) [inline], [static]**

Parameters

---

## TPM HAL driver

|               |                                 |
|---------------|---------------------------------|
| <i>base</i>   | TPM module base address pointer |
| <i>enable</i> | false pause, true continue work |

**71.2.4.37** `static void TPM_HAL_SetWaitMode ( TPM_Type * base, bool enable )`  
`[inline], [static]`

### Parameters

|               |                                    |
|---------------|------------------------------------|
| <i>base</i>   | TPM module base address pointer    |
| <i>enable</i> | 0 continue running, 1 stop running |

## 71.3 TPM Peripheral driver

### 71.3.1 Overview

The section describes the programming interface of the TPM Peripheral driver. The TPM module is a timer that supports input capture, output compare, and generation of PWM signals. The current SDK driver supports all features.

### 71.3.2 TPM Initialization

1. To initialize the TPM driver, call the `TPM_DRV_Init()` function and pass the instance number of the relevant TPM. For example, to use TPM0, pass a value 0 to the initialization function.
2. Pass a user configuration structure `tpm_general_config_t`, as shown here:

```
// TPM configuration structure for. The user needs to set the relevant configurations.
typedef struct TpmGeneralConfig {
 bool isDBGMode;
 bool isGlobalTimeBase;
 bool isTriggerMode;
 bool isStopCountOnOverflow;
 bool isCountReloadOnTrig;
 tpm_trigger_source_t triggerSource;
} tpm_general_config_t;
```

### 71.3.3 TPM Generate a PWM signal

Call the `TPM_DRV_PwmStart()` function to generate a PWM signal. Use this structure to configure the different parameters related to this PWM signal.

```
typedef struct TpmPwmParam
{
 tpm_pwm_mode_t mode;
 tpm_pwm_edge_mode_t edgeMode;
 uint32_t uFrequencyHZ;
 uint32_t uDutyCyclePercent;

 0=inactive signal(0% duty cycle)...
 100=active signal (100% duty cycle). //
} tpm_pwm_param_t;
```

The mode options are `kTpmEdgeAlignedPWM` and `kTpmCenterAlignedPWM`. For edge mode, the options are `kTpmHighTrue` and `kTpmLowTrue`. Specify the PWM signal frequency in Hertz and the duty cycle percentage (value between 0-100).

### 71.3.4 TPM Input Capture

Call the `TPM_DRV_InputCaptureEnable()` function to set up the channel for input capture. Use this enumeration to specify the capture mode:

## TPM Peripheral driver

```
typedef enum _tpm_input_capture_mode_t
{
 kTpmRisingEdge = 1,
 kTpmFallingEdge,
 kTpmRiseOrFallEdge
}tpm_input_capture_mode_t;
```

To enable channel interrupts, use the `intEnable` argument of the function.

Call the `TPM_DRV_GetChnVal()` function to read the captured LPTPM counter value.

### 71.3.5 TPM Output Compare

Call the `TPM_DRV_OutputCompareEnable()` function to set up the channel for output compare. Use this enumeration to specify the compare mode:

```
typedef enum _tpm_output_compare_mode_t
{
 kTpmOutputNone = 0,
 kTpmToggleOutput,
 kTpmClearOutput,
 kTpmSetOutput,
 kTpmHighPulseOutput,
 kTpmLowPulseOutput
}tpm_output_compare_mode_t;
```

To enable channel interrupts, use the `intEnable` argument of the function. The `matchVal` argument of the function is written to the CnV register.

### 71.3.6 TPM Interrupt handler

The TPM driver provides an interrupt handler for the counter overflow and channel interrupts. These handlers clear the status bits.

To add more actions to the default handler, add calls to the functions inside the interrupt handlers `TPMx_IRQHandler()` function, where `x=0, 1, 2` depending on the TPM instance.

## Data Structures

- struct `tpm_general_config_t`  
*Internal driver state information grouped by names. [More...](#)*

## Functions

- `tpm_status_t TPM_DRV_Init` (`uint32_t` instance, `const tpm_general_config_t *info`)  
*Initializes the TPM driver.*
- `void TPM_DRV_PwmStop` (`uint32_t` instance, `tpm_pwm_param_t *param`, `uint8_t` channel)

- Stops the channel PWM.*

  - `tpm_status_t TPM_DRV_PwmStart` (uint32\_t instance, `tpm_pwm_param_t` \*param, uint8\_t channel)
- Configures the duty cycle and frequency and starts outputting PWM on a specified channel.*

  - void `TPM_DRV_SetTimeOverflowIntCmd` (uint32\_t instance, bool overflowEnable)
- Enables or disables the timer overflow interrupt.*

  - void `TPM_DRV_SetChnIntCmd` (uint32\_t instance, uint8\_t channelNum, bool enable)
- Enables or disables the channel interrupt.*

  - void `TPM_DRV_SetClock` (uint32\_t instance, `tpm_clock_mode_t` clock, `tpm_clock_ps_t` clockPs)
- Sets the TPM clock source.*

  - uint32\_t `TPM_DRV_GetClock` (uint32\_t instance)
- Gets the TPM clock frequency.*

  - void `TPM_DRV_CounterStart` (uint32\_t instance, `tpm_counting_mode_t` countMode, uint32\_t countFinalVal, bool enableOverflowInt)
- Starts the TPM counter.*

  - void `TPM_DRV_CounterStop` (uint32\_t instance)
- Stops the TPM counter.*

  - uint32\_t `TPM_DRV_CounterRead` (uint32\_t instance)
- Reads back the current value of the TPM counter.*

  - void `TPM_DRV_InputCaptureEnable` (uint32\_t instance, uint8\_t channel, `tpm_input_capture_mode_t` mode, uint32\_t countFinalVal, bool intEnable)
- TPM input capture mode setup.*

  - uint32\_t `TPM_DRV_GetChnVal` (uint32\_t instance, uint8\_t channel)
- Reads back the current value of the TPM channel value.*

  - void `TPM_DRV_OutputCompareEnable` (uint32\_t instance, uint8\_t channel, `tpm_output_compare_mode_t` mode, uint32\_t countFinalVal, uint32\_t matchVal, bool intEnable)
- TPM output compare mode setup.*

  - void `TPM_DRV_Deinit` (uint32\_t instance)
- Shuts down the TPM driver.*

  - void `TPM_DRV_IRQHandler` (uint32\_t instance)
- Action to take when an TPM interrupt is triggered.*

## Variables

- TPM\_Type \*const `g_tpmBase` [TPM\_INSTANCE\_COUNT]  
*Table of base addresses for TPM instances.*
- const IRQn\_Type `g_tpmIrqId` [TPM\_INSTANCE\_COUNT]  
*Table to save TPM IRQ numbers for TPM instances.*

## 71.3.7 Data Structure Documentation

### 71.3.7.1 struct tpm\_general\_config\_t

User needs to set the relevant ones.

## TPM Peripheral driver

### Data Fields

- bool [isDBGMode](#)  
*DBGMode behavioral, false to pause, true to continue run in DBG mode.*
- bool [isGlobalTimeBase](#)  
*If Global time base enabled, true to enable, false to disable.*
- bool [isTriggerMode](#)  
*If Trigger mode enabled, true to enable, false to disable.*
- bool [isStopCountOnOverflow](#)  
*True to stop counter after overflow, false to continue running.*
- bool [isCountReloadOnTrig](#)  
*True to reload counter on trigger, false means counter is not reloaded.*
- [tpm\\_trigger\\_source\\_t triggerSource](#)  
*Trigger source if trigger mode enabled.*

### 71.3.8 Function Documentation

#### 71.3.8.1 `tpm_status_t TPM_DRV_Init ( uint32_t instance, const tpm_general_config_t * info )`

##### Parameters

|                 |                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------|
| <i>instance</i> | The TPM peripheral instance number.                                                         |
| <i>info</i>     | Pointer to the TPM user configuration structure, see <a href="#">tpm_general_config_t</a> . |

##### Returns

kStatusTpmSuccess means success; Otherwise means failure.

#### 71.3.8.2 `void TPM_DRV_PwmStop ( uint32_t instance, tpm_pwm_param_t * param, uint8_t channel )`

##### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>instance</i> | The TPM peripheral instance number.    |
| <i>param</i>    | PWM parameter to configure PWM options |
| <i>channel</i>  | The channel number.                    |

**71.3.8.3 tpm\_status\_t TPM\_DRV\_PwmStart ( uint32\_t *instance*, tpm\_pwm\_param\_t \* *param*, uint8\_t *channel* )**

Parameters

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| <i>instance</i> | The TPM peripheral instance number.                                           |
| <i>param</i>    | PWM parameter to configure PWM options, see <a href="#">tpm_pwm_param_t</a> . |
| <i>channel</i>  | The channel number.                                                           |

Returns

kStatusTpmSuccess means success; Otherwise means failure.

**71.3.8.4 void TPM\_DRV\_SetTimeOverflowIntCmd ( uint32\_t *instance*, bool *overflowEnable* )**

Parameters

|                       |                                                           |
|-----------------------|-----------------------------------------------------------|
| <i>instance</i>       | The TPM peripheral instance number.                       |
| <i>overflowEnable</i> | true: enable the timer overflow interrupt, false: disable |

**71.3.8.5 void TPM\_DRV\_SetChnIntCmd ( uint32\_t *instance*, uint8\_t *channelNum*, bool *enable* )**

Parameters

|                   |                                                    |
|-------------------|----------------------------------------------------|
| <i>instance</i>   | The TPM peripheral instance number.                |
| <i>channelNum</i> | The channel number.                                |
| <i>enable</i>     | true: enable the channel interrupt, false: disable |

**71.3.8.6 void TPM\_DRV\_SetClock ( uint32\_t *instance*, tpm\_clock\_mode\_t *clock*, tpm\_clock\_ps\_t *clockPs* )**

## TPM Peripheral driver

Parameters

|                 |                                                                                |
|-----------------|--------------------------------------------------------------------------------|
| <i>instance</i> | The TPM peripheral instance number.                                            |
| <i>clock</i>    | The TPM peripheral clock selection, see <a href="#">tpm_clock_mode_t</a> .     |
| <i>clockPs</i>  | The TPM peripheral clock prescale factor, see <a href="#">tpm_clock_ps_t</a> . |

### 71.3.8.7 uint32\_t TPM\_DRV\_GetClock ( uint32\_t instance )

Parameters

|                 |                                     |
|-----------------|-------------------------------------|
| <i>instance</i> | The TPM peripheral instance number. |
|-----------------|-------------------------------------|

Returns

The function returns the frequency of the TPM clock.

### 71.3.8.8 void TPM\_DRV\_CounterStart ( uint32\_t instance, tpm\_counting\_mode\_t countMode, uint32\_t countFinalVal, bool enableOverflowInt )

This function provides access to the TPM counter. The counter can run in up-counting and up-down counting modes.

Parameters

|                           |                                                                       |
|---------------------------|-----------------------------------------------------------------------|
| <i>instance</i>           | The TPM peripheral instance number.                                   |
| <i>countMode</i>          | The TPM counter mode defined by <a href="#">tpm_counting_mode_t</a> . |
| <i>countFinalVal</i>      | The final value that is stored in the MOD register.                   |
| <i>enable-OverflowInt</i> | true: enable timer overflow interrupt; false: disable                 |

### 71.3.8.9 void TPM\_DRV\_CounterStop ( uint32\_t instance )

Parameters

---

|                 |                                     |
|-----------------|-------------------------------------|
| <i>instance</i> | The TPM peripheral instance number. |
|-----------------|-------------------------------------|

### 71.3.8.10 uint32\_t TPM\_DRV\_CounterRead ( uint32\_t *instance* )

Parameters

|                 |                                     |
|-----------------|-------------------------------------|
| <i>instance</i> | The TPM peripheral instance number. |
|-----------------|-------------------------------------|

Returns

The current value of the TPM counter.

### 71.3.8.11 void TPM\_DRV\_InputCaptureEnable ( uint32\_t *instance*, uint8\_t *channel*, tpm\_input\_capture\_mode\_t *mode*, uint32\_t *countFinalVal*, bool *intEnable* )

Parameters

|                      |                                                                          |
|----------------------|--------------------------------------------------------------------------|
| <i>instance</i>      | The TPM peripheral instance number.                                      |
| <i>channel</i>       | The channel number.                                                      |
| <i>mode</i>          | The TPM input mode defined by <a href="#">tpm_input_capture_mode_t</a> . |
| <i>countFinalVal</i> | The final value that is stored in the MOD register.                      |
| <i>intEnable</i>     | true: enable channel interrupt; false: disable                           |

### 71.3.8.12 uint32\_t TPM\_DRV\_GetChnVal ( uint32\_t *instance*, uint8\_t *channel* )

Parameters

|                 |                                     |
|-----------------|-------------------------------------|
| <i>instance</i> | The TPM peripheral instance number. |
| <i>channel</i>  | The channel number.                 |

Returns

The current value of the TPM channel value.

### 71.3.8.13 void TPM\_DRV\_OutputCompareEnable ( uint32\_t *instance*, uint8\_t *channel*, tpm\_output\_compare\_mode\_t *mode*, uint32\_t *countFinalVal*, uint32\_t *matchVal*, bool *intEnable* )

## TPM Peripheral driver

### Parameters

|                      |                                                                            |
|----------------------|----------------------------------------------------------------------------|
| <i>instance</i>      | The TPM peripheral instance number.                                        |
| <i>channel</i>       | The channel number.                                                        |
| <i>mode</i>          | The TPM output mode defined by <a href="#">tpm_output_compare_mode_t</a> . |
| <i>countFinalVal</i> | The final value that is stored in the MOD register.                        |
| <i>matchVal</i>      | The channel compare value stored in the CnV register                       |
| <i>intEnable</i>     | true: enable channel interrupt; false: disable                             |

### 71.3.8.14 void TPM\_DRV\_Deinit ( uint32\_t *instance* )

#### Parameters

|                 |                                     |
|-----------------|-------------------------------------|
| <i>instance</i> | The TPM peripheral instance number. |
|-----------------|-------------------------------------|

### 71.3.8.15 void TPM\_DRV\_IRQHandler ( uint32\_t *instance* )

The timer overflow flag is checked and cleared if set.

#### Parameters

|                 |                                    |
|-----------------|------------------------------------|
| <i>instance</i> | Instance number of the TPM module. |
|-----------------|------------------------------------|

## 71.3.9 Variable Documentation

## Chapter 72

# True Random Number Generator (TRNG)

### 72.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the True Random Number Generator (TRNG) module of Kinetis devices.

The True Random Number Generator is hardware accelerator module that generates a 512-bit entropy as needed by an entropy consuming module or by other post processing functions. A typical entropy consumer is a pseudo random number generator (PRNG) which can be implemented to achieve both true randomness and cryptographic strength random numbers using the TRNG output as its entropy seed. The entropy generated by a TRNG is intended for direct use by functions that generate secret keys, per-message secrets, random challenges, and other similar quantities used in cryptographic algorithms.

### Modules

  - `kStatus_TRNG_TestFailMonoBit` = 0x080004U,
  - `kStatus_TRNG_TestFailFrequencyCount` = 0x100004U }

*Defines status return codes for TRNG function calls.*

## TRNG HAL.

- void `TRNG_HAL_Init` (TRNG\_Type \*base)
  - Initializes the TRNG module.*
- void `TRNG_HAL_Enable` (TRNG\_Type \*base)
  - Enables the TRNG module.*
- static void `TRNG_HAL_SetWorkingMode` (TRNG\_Type \*base, `trng_work_mode_t` mode)
  - Sets the TRNG to Program Mode or Run mode.*
- static void `TRNG_HAL_Disable` (TRNG\_Type \*base)
  - Disables the TRNG module.*
- static bool `TRNG_HAL_GetEntropyValidCmd` (TRNG\_Type \*base)
  - Gets the TRNG status whether the generated entropy is valid.*
- static bool `TRNG_HAL_GetErrorCmd` (TRNG\_Type \*base)
  - Gets the TRNG status whether the error occurred.*
- static void `TRNG_HAL_ClearError` (TRNG\_Type \*base)
  - Clears the TRNG error flag.*
- static bool `TRNG_HAL_GetOKToStopCmd` (TRNG\_Type \*base)

## TRNG HAL driver

- Gets the TRNG status whether the TRNG ring oscillator is not running.*

  - static void [TRNG\\_HAL\\_EnableLock](#) (TRNG\_Type \*base)
- Disables the programmability of TRNG registers.*

  - static bool [TRNG\\_HAL\\_GetLockCmd](#) (TRNG\_Type \*base)
- Gets the status of the possibility to program the TRNG registers.*

  - static void [TRNG\\_HAL\\_SetSampleMode](#) (TRNG\_Type \*base, [trng\\_sample\\_mode\\_t](#) mode)
- Sets the sample mode of the TRNG ring oscillator.*

  - static [trng\\_sample\\_mode\\_t](#) [TRNG\\_HAL\\_GetSampleMode](#) (TRNG\_Type \*base)
- Gets the sample mode of the TRNG ring oscillator.*

  - static void [TRNG\\_HAL\\_SetClockMode](#) (TRNG\_Type \*base, [trng\\_clock\\_mode\\_t](#) mode)
- Sets the clock mode used to operate TRNG.*

  - static [trng\\_clock\\_mode\\_t](#) [TRNG\\_HAL\\_GetClockMode](#) (TRNG\_Type \*base)
- Gets the clock mode used to operate the TRNG.*

  - static void [TRNG\\_HAL\\_SetRingOscDiv](#) (TRNG\_Type \*base, [trng\\_ring\\_osc\\_div\\_t](#) osc\_div)
- Sets the ring oscillator divide used by the TRNG.*

  - static [trng\\_ring\\_osc\\_div\\_t](#) [TRNG\\_HAL\\_GetRingOscDiv](#) (TRNG\_Type \*base)
- Gets the ring oscillator divide used by the TRNG.*

  - static void [TRNG\\_HAL\\_SetSampleSize](#) (TRNG\_Type \*base, uint16\_t sample\_size)
- Sets the TRNG sample size.*

  - static uint16\_t [TRNG\\_HAL\\_GetSampleSize](#) (TRNG\_Type \*base)
- Gets the TRNG sample size.*

  - static void [TRNG\\_HAL\\_SetEntropyDelay](#) (TRNG\_Type \*base, uint16\_t ent\_delay)
- Sets the TRNG entropy delay.*

  - static uint16\_t [TRNG\\_HAL\\_GetEntropyDelay](#) (TRNG\_Type \*base)
- Gets the TRNG entropy delay.*

  - static void [TRNG\\_HAL\\_SetSparseBitLimit](#) (TRNG\_Type \*base, uint16\_t sparse\_bit\_limit)
- Sets the TRNG sparse bit limit.*

  - static uint16\_t [TRNG\\_HAL\\_GetSparseBitLimit](#) (TRNG\_Type \*base)
- Gets the TRNG sparse bit limit.*

  - [trng\\_status\\_t](#) [TRNG\\_HAL\\_SetRetryCount](#) (TRNG\_Type \*base, uint8\_t retry\_count)
- Sets the TRNG retry count.*

  - static uint8\_t [TRNG\\_HAL\\_GetRetryCount](#) (TRNG\_Type \*base)
- Gets the TRNG retry count.*

  - static void [TRNG\\_HAL\\_SetLongRunMaxLimit](#) (TRNG\_Type \*base, uint8\_t long\_run\_max\_limit)
- Sets the TRNG long run maximum limit.*

  - static uint8\_t [TRNG\\_HAL\\_GetLongRunMaxLimit](#) (TRNG\_Type \*base)
- Gets the TRNG long run maximum limit.*

  - void [TRNG\\_HAL\\_SetIntMode](#) (TRNG\_Type \*base, [trng\\_interrupt\\_t](#) interrupt, bool enable)
- Enables or disables the related TRNG interrupt.*

  - static bool [TRNG\\_HAL\\_GetIntMode](#) (TRNG\_Type \*base, [trng\\_interrupt\\_t](#) interrupt)
- Gets whether the TRNG interrupt is enabled.*

  - static bool [TRNG\\_HAL\\_GetIntStatusFlag](#) (TRNG\_Type \*base, [trng\\_interrupt\\_t](#) interrupt)
- Gets the TRNG interrupt status.*

  - static void [TRNG\\_HAL\\_ClearIntStatusFlag](#) (TRNG\_Type \*base, [trng\\_interrupt\\_t](#) interrupt)
- Clears the interrupt status of the TRNG module.*

  - [trng\\_status\\_t](#) [TRNG\\_HAL\\_SetStatisticalCheckLimit](#) (TRNG\_Type \*base, [trng\\_statistical\\_check\\_t](#) statistical\_check, const [trng\\_statistical\\_check\\_limit\\_t](#) \*limit)
- Sets statistical check limits.*

  - void [TRNG\\_HAL\\_GetStatisticalCheckLimit](#) (TRNG\_Type \*base, [trng\\_statistical\\_check\\_t](#) statistical\_check, [trng\\_statistical\\_check\\_limit\\_t](#) \*limit)
- Gets statistical check limits.*

- `uint32_t TRNG_HAL_ReadEntropy` (TRNG\_Type \*base, uint32\_t index)  
*Gets a entry data from the TRNG.*
- `trng_status_t TRNG_HAL_GetStatus` (TRNG\_Type \*base)  
*Gets the TRNG status.*

## 72.2.2 Data Structure Documentation

### 72.2.2.1 struct trng\_statistical\_check\_limit\_t

#### Data Fields

- `uint32_t maximum`  
*Maximum limit.*
- `uint32_t minimum`  
*Minimum limit.*

#### 72.2.2.1.0.10 Field Documentation

72.2.2.1.0.10.1 `uint32_t trng_statistical_check_limit_t::maximum`

72.2.2.1.0.10.2 `uint32_t trng_statistical_check_limit_t::minimum`

## 72.2.3 Enumeration Type Documentation

### 72.2.3.1 enum trng\_work\_mode\_t

Enumerator

***kTRNGWorkModeRun*** Run Mode.  
***kTRNGWorkModeProgram*** Program Mode.

### 72.2.3.2 enum trng\_sample\_mode\_t

Enumerator

***kTRNGSampleModeVonNeumann*** Use Von Neumann data into both Entropy shifter and Statistical Checker.  
***kTRNGSampleModeRaw*** Use raw data into both Entropy shifter and Statistical Checker.  
***kTRNGSampleModeVonNeumannRaw*** Use Von Neumann data into Entropy shifter. Use raw data into Statistical Checker.

### 72.2.3.3 enum trng\_clock\_mode\_t

Enumerator

***kTRNGClockModeRingOscillator*** Ring oscillator is used to operate the TRNG (default).

## TRNG HAL driver

***kTRNGClockModeSystem*** System clock is used to operate the TRNG. This is for test use only, and indeterminate results may occur.

### 72.2.3.4 enum trng\_ring\_osc\_div\_t

Enumerator

***kTRNGRingOscDiv0*** Ring oscillator with no divide (default).  
***kTRNGRingOscDiv2*** Ring oscillator divided-by-2.  
***kTRNGRingOscDiv4*** Ring oscillator divided-by-4.  
***kTRNGRingOscDiv8*** Ring oscillator divided-by-8.

### 72.2.3.5 enum trng\_statistical\_check\_t

Enumerator

***kTRNGStatisticalCheckMonobit*** Statistical check of number of ones/zero detected during entropy generation.  
***kTRNGStatisticalCheckRunBit1*** Statistical check of number of runs of length 1 detected during entropy generation.  
***kTRNGStatisticalCheckRunBit2*** Statistical check of number of runs of length 2 detected during entropy generation.  
***kTRNGStatisticalCheckRunBit3*** Statistical check of number of runs of length 3 detected during entropy generation.  
***kTRNGStatisticalCheckRunBit4*** Statistical check of number of runs of length 4 detected during entropy generation.  
***kTRNGStatisticalCheckRunBit5*** Statistical check of number of runs of length 5 detected during entropy generation.  
***kTRNGStatisticalCheckRunBit6Plus*** Statistical check of number of runs of length 6 or more detected during entropy generation.  
***kTRNGStatisticalCheckPoker*** Statistical check of "Poker Test".  
***kTRNGStatisticalCheckFrequencyCount*** Statistical check of entropy sample frequency count.

### 72.2.3.6 enum trng\_interrupt\_t

Enumerator

***kTRNGInterruptFrequencyCountFail*** Frequency Count Fail.  
***kTRNGInterruptFrequencyEntropyValid*** Entropy Valid.  
***kTRNGInterruptFrequencyHWError*** Any HW error.  
***kTRNGInterruptAll*** All interrupts.

### 72.2.3.7 enum trng\_status\_t

Enumerator

- kStatus\_TRNG\_Success* Success. No error.
- kStatus\_TRNG\_InvalidArgument* Invalid argument.
- kStatus\_TRNG\_OSAError* OSA initialisation failed.
- kStatus\_TRNG\_Error* Any TRNG module error occurred.
- kStatus\_TRNG\_TestFailRunBit1Sampling0* The 1-Bit Run, Sampling 0s Test has failed.
- kStatus\_TRNG\_TestFailRunBit1Sampling1* The 1-Bit Run, Sampling 1s Test has failed.
- kStatus\_TRNG\_TestFailRunBit2Sampling0* The 2-Bit Run, Sampling 0s Test has failed.
- kStatus\_TRNG\_TestFailRunBit2Sampling1* The 2-Bit Run, Sampling 1s Test has failed.
- kStatus\_TRNG\_TestFailRunBit3Sampling0* The 3-Bit Run, Sampling 0s Test has failed.
- kStatus\_TRNG\_TestFailRunBit3Sampling1* The 3-Bit Run, Sampling 1s Test has failed.
- kStatus\_TRNG\_TestFailRunBit4Sampling0* The 4-Bit Run, Sampling 0s Test has failed.
- kStatus\_TRNG\_TestFailRunBit4Sampling1* The 4-Bit Run, Sampling 1s Test has failed.
- kStatus\_TRNG\_TestFailRunBit5Sampling0* The 5-Bit Run, Sampling 0s Test has failed.
- kStatus\_TRNG\_TestFailRunBit5Sampling1* The 5-Bit Run, Sampling 1s Test has failed.
- kStatus\_TRNG\_TestFailRunBit6PlusSampling0* The 6 Plus Bit Run, Sampling 0s Test has failed.
- kStatus\_TRNG\_TestFailRunBit6PlusSampling1* The 6 Plus Bit Run, Sampling 1s Test has failed.
- kStatus\_TRNG\_TestFailSparseBit* The Sparse Bit Test has failed.
- kStatus\_TRNG\_TestFailLongRun* The Long Run Test has failed.
- kStatus\_TRNG\_TestFailPoker* The Poker Test has failed.
- kStatus\_TRNG\_TestFailMonoBit* The Mono Bit Test has failed.
- kStatus\_TRNG\_TestFailFrequencyCount* Frequency Count Fail. The frequency counter has detected a failure. This may be due to improper programming of maximum and minimum limits for statistical check of entropy sample frequency count, or a hardware failure in the ring oscillator.

## 72.2.4 Function Documentation

### 72.2.4.1 void TRNG\_HAL\_Init ( TRNG\_Type \* base )

This function initializes the TRNG to a default state.

Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### 72.2.4.2 void TRNG\_HAL\_Enable ( TRNG\_Type \* base )

This function enables the TRNG random data generation and loading.

## TRNG HAL driver

Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### 72.2.4.3 static void TRNG\_HAL\_SetWorkingMode ( TRNG\_Type \* *base*, trng\_work\_mode\_t *mode* ) [inline], [static]

This function specifies whether the TRNG is in Program Mode or Run mode.

Parameters

|             |                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------|
| <i>base</i> | TRNG base address                                                                                                      |
| <i>mode</i> | kTRNGWorkModeRun means set TRNG in Run Mode. kTRNGWorkModeProgram means set TRNG in Program Mode (default after init). |

### 72.2.4.4 static void TRNG\_HAL\_Disable ( TRNG\_Type \* *base* ) [inline], [static]

This function disables the TRNG module and stops generation of Entropy value.

Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### 72.2.4.5 static bool TRNG\_HAL\_GetEntropyValidCmd ( TRNG\_Type \* *base* ) [inline], [static]

This function gets the TRNG status whether an entropy is valid.

Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

Returns

0 means Entropy is not valid, 1 means Entropy is valid

### 72.2.4.6 static bool TRNG\_HAL\_GetErrorCmd ( TRNG\_Type \* *base* ) [inline], [static]

This function gets the TRNG status whether an error is detected.

## Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

## Returns

0 means no error, 1 means error is detected

**72.2.4.7 static void TRNG\_HAL\_ClearError ( TRNG\_Type \* *base* ) [inline],  
[static]**

This function clears the TRNG error flag.

## Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

**72.2.4.8 static bool TRNG\_HAL\_GetOKToStopCmd ( TRNG\_Type \* *base* ) [inline],  
[static]**

This function gets the TRNG status that indicates whether the TRNG ring oscillator is not running. Software should check this status before transitioning TRNG to low power mode (TRNG clock stopped). TRNG turns on the TRNG free-running ring oscillator whenever new entropy is being generated and turns off the ring oscillator when entropy generation is complete. If the TRNG clock is stopped while the TRNG ring oscillator is running, the oscillator continues running though the RNG clock. is stopped.

## Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

## Returns

0 means TRNG ring oscillator is running, 1 means TRNG ring oscillator is not running

**72.2.4.9 static void TRNG\_HAL\_EnableLock ( TRNG\_Type \* *base* ) [inline],  
[static]**

This function disables the possibility to program TRNG registers regardless of the TRNG working mode. After that, any attempt to modify a TRNG register causes a hard fault. Only the asynchronous reset returns the possibility to write to the TRNG registers.

## TRNG HAL driver

Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### 72.2.4.10 `static bool TRNG_HAL_GetLockCmd ( TRNG_Type * base ) [inline], [static]`

This function gets current status of possibility to program TRNG registers.

Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

Returns

0 means that is enabled programmability of TRNG registers (default value). 1 means that is disabled programmability of TRNG registers in any mode.

### 72.2.4.11 `static void TRNG_HAL_SetSampleMode ( TRNG_Type * base, trng_sample_mode_t mode ) [inline], [static]`

This function specifies the method of sampling the ring oscillator while generating the entropy value.

Parameters

|             |                                                                                                                                                                                                                                                                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i> | TRNG base address                                                                                                                                                                                                                                                                                                                    |
| <i>mode</i> | kTRNGSampleModeVonNeumann means use Von Neumann data into both Entropy shifter and Statistical Checker kTRNGSampleModeRaw means use raw data into both Entropy shifter and Statistical Checker (default value). kTRNGSampleModeVonNeumannRaw means use Von Neumann data into Entropy shifter. Use raw data into Statistical Checker. |

### 72.2.4.12 `static trng_sample_mode_t TRNG_HAL_GetSampleMode ( TRNG_Type * base ) [inline], [static]`

This function gets the method of sampling the ring oscillator while generating the entropy value.

## Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

## Returns

kTRNGSampleModeVonNeumann means Von Neumann data placed into both Entropy shifter and Statistical Checker, kTRNGSampleModeRaw means raw data placed into both Entropy shifter and Statistical Checker, kTRNGSampleModeVonNeumannRaw means Von Neumann data placed into Entropy shifter and raw data placed into Statistical Checker.

#### 72.2.4.13 **static void TRNG\_HAL\_SetClockMode ( TRNG\_Type \* *base*, trng\_clock\_mode\_t *mode* ) [inline], [static]**

This function specifies the clock mode used to operate TRNG. By default is used TRNG ring oscillator. Changing clock mode is for test use only, and indeterminate results may occur.

## Parameters

|             |                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i> | TRNG base address                                                                                                                                        |
| <i>mode</i> | kTRNGClockModeRingOscillator means use ring oscillator to operate the TRNG (default), kTRNGClockModeSystem means force system clock to operate the TRNG. |

#### 72.2.4.14 **static trng\_clock\_mode\_t TRNG\_HAL\_GetClockMode ( TRNG\_Type \* *base* ) [inline], [static]**

This function gets the clock mode used to operate TRNG.

## Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

## Returns

kTRNGClockModeRingOscillator means ring oscillator is used to operate the TRNG, kTRNGClockModeSystem means system clock is used to operate the TRNG.

#### 72.2.4.15 **static void TRNG\_HAL\_SetRingOscDiv ( TRNG\_Type \* *base*, trng\_ring\_osc\_div\_t *osc\_div* ) [inline], [static]**

This function determines the amount of dividing done to the ring oscillator before it is used by the TRNG.

## TRNG HAL driver

### Parameters

|                |                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>    | TRNG base address                                                                                                                                                                                                                               |
| <i>osc_div</i> | kTRNGRingOscDiv0 means use ring oscillator with no divide (default), kTRNGRingOscDiv2 means use ring oscillator divided-by-2, kTRNGRingOscDiv4 means use ring oscillator divided-by-4, kTRNGRingOscDiv8 means use ring oscillator divided-by-8. |

#### 72.2.4.16 **static trng\_ring\_osc\_div\_t TRNG\_HAL\_GetRingOscDiv ( TRNG\_Type \* *base* ) [inline], [static]**

This function gets the amount of dividing done to the ring oscillator before it is used by the TRNG.

### Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### Returns

kTRNGRingOscDiv0 means ring oscillator with no divide is used, kTRNGRingOscDiv2 means ring oscillator divided-by-2 is used, kTRNGRingOscDiv4 means ring oscillator divided-by-4 is used, kTRNGRingOscDiv8 means ring oscillator divided-by-8 is used.

#### 72.2.4.17 **static void TRNG\_HAL\_SetSampleSize ( TRNG\_Type \* *base*, uint16\_t *sample\_size* ) [inline], [static]**

This function sets the total number of Entropy samples that is taken during the entropy generation.

### Parameters

|                    |                    |
|--------------------|--------------------|
| <i>base</i>        | TRNG base address  |
| <i>sample_size</i> | Number of samples. |

#### 72.2.4.18 **static uint16\_t TRNG\_HAL\_GetSampleSize ( TRNG\_Type \* *base* ) [inline], [static]**

This function gets the total number of entropy samples that are taken during the entropy generation.

## Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

## Returns

Sample size. After initialization, it is reset to default 2500.

**72.2.4.19 static void TRNG\_HAL\_SetEntropyDelay ( TRNG\_Type \* *base*, uint16\_t *ent\_delay* ) [inline], [static]**

This function sets the length (in system clocks) of each entropy sample taken.

## Parameters

|                  |                   |
|------------------|-------------------|
| <i>base</i>      | TRNG base address |
| <i>ent_delay</i> | Entropy delay.    |

**72.2.4.20 static uint16\_t TRNG\_HAL\_GetEntropyDelay ( TRNG\_Type \* *base* ) [inline], [static]**

This function gets the length (in system clocks) of each entropy sample taken.

## Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

## Returns

Entropy delay. After initialization, it is reset to default 3200.

**72.2.4.21 static void TRNG\_HAL\_SetSparseBitLimit ( TRNG\_Type \* *base*, uint16\_t *sparse\_bit\_limit* ) [inline], [static]**

This function sets the Sparse Bit Limit which defines the maximum number of consecutive samples that may be discarded before an error is generated. This limit is used only for During Von Neumann sampling (enabled by [TRNG\\_HAL\\_SetSampleMode\(\)](#)). Samples are discarded if two consecutive raw samples are both 0 or both 1. If this discarding occurs for a long period of time, it indicates that there is insufficient Entropy.

## TRNG HAL driver

### Parameters

|                         |                   |
|-------------------------|-------------------|
| <i>base</i>             | TRNG base address |
| <i>sparse_bit_limit</i> | Sparse bit limit. |

#### 72.2.4.22 `static uint16_t TRNG_HAL_GetSparseBitLimit ( TRNG_Type * base )` `[inline], [static]`

This function gets the Sparse Bit Limit which defines the maximum number of consecutive samples that may be discarded before an error is generated. This limit is used only for During Von Neumann sampling (enabled by [TRNG\\_HAL\\_SetSampleMode\(\)](#)). Samples are discarded if two consecutive raw samples are both 0 or both 1. If this discarding occurs for a long period of time, it indicates that there is insufficient Entropy.

### Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### Returns

Sparse bit limit. After initialization, it is reset to default 63.

#### 72.2.4.23 `trng_status_t TRNG_HAL_SetRetryCount ( TRNG_Type * base, uint8_t` `retry_count )`

This function sets the retry counter which defines the number of times a statistical check may fails during the TRNG entropy generation before generating an error.

### Parameters

|                    |                     |
|--------------------|---------------------|
| <i>base</i>        | TRNG base address   |
| <i>retry_count</i> | Retry count [1-15]. |

### Returns

If successful, returns the `kStatus_TRNG_Success`. Otherwise, it returns `kStatus_TRNG_InvalidArgument`.

```
72.2.4.24 static uint8_t TRNG_HAL_GetRetryCount (TRNG_Type * base) [inline],
 [static]
```

This function gets the retry counter which defines the number of times a statistical check may fails during the TRNG entropy generation before generating an error.

## TRNG HAL driver

### Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### Returns

Retry count. After initialization, it is reset to default 1.

**72.2.4.25 static void TRNG\_HAL\_SetLongRunMaxLimit ( TRNG\_Type \* *base*, uint8\_t *long\_run\_max\_limit* ) [inline], [static]**

This function sets the largest allowable number of consecutive samples of all 1, or all 0, that is allowed during the Entropy generation.

### Parameters

|                           |                                                          |
|---------------------------|----------------------------------------------------------|
| <i>base</i>               | TRNG base address                                        |
| <i>long_run_max_limit</i> | Maximum limit of consecutive samples of all 1, or all 0. |

**72.2.4.26 static uint8\_t TRNG\_HAL\_GetLongRunMaxLimit ( TRNG\_Type \* *base* ) [inline], [static]**

This function gets value of largest allowable number of consecutive samples of all 1, or all 0, that is allowed during the Entropy generation.

### Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

### Returns

Maximum limit of consecutive samples of all 1, or all 0.

**72.2.4.27 void TRNG\_HAL\_SetIntMode ( TRNG\_Type \* *base*, trng\_interrupt\_t *interrupt*, bool *enable* )**

This function enables or disables interrupts that are generated by the TRNG.

## Parameters

|                  |                                                                  |
|------------------|------------------------------------------------------------------|
| <i>base</i>      | TRNG base address                                                |
| <i>interrupt</i> | The interrupt sources defined by <code>trng_interrupt_t</code> . |
| <i>enable</i>    | The interrupt enable switch.                                     |

**72.2.4.28 static bool TRNG\_HAL\_GetIntMode ( TRNG\_Type \* *base*, trng\_interrupt\_t *interrupt* ) [inline], [static]**

This function returns whether the TRNG interrupt is enabled or disabled.

## Parameters

|                  |                                                                  |
|------------------|------------------------------------------------------------------|
| <i>base</i>      | TRNG base address                                                |
| <i>interrupt</i> | The interrupt sources defined by <code>trng_interrupt_t</code> . |

## Returns

true, if interrupt enabled(unmasked). false, if interrupt disabled(masked).

**72.2.4.29 static bool TRNG\_HAL\_GetIntStatusFlag ( TRNG\_Type \* *base*, trng\_interrupt\_t *interrupt* ) [inline], [static]**

This function returns whether the TRNG interrupt is happened or not.

## Parameters

|                  |                                                                  |
|------------------|------------------------------------------------------------------|
| <i>base</i>      | TRNG base address                                                |
| <i>interrupt</i> | The interrupt sources defined by <code>trng_interrupt_t</code> . |

## Returns

true, if the interrupt event happened. false, if the interrupt event has not happened.

**72.2.4.30 static void TRNG\_HAL\_ClearIntStatusFlag ( TRNG\_Type \* *base*, trng\_interrupt\_t *interrupt* ) [inline], [static]**

This function clears the TRNG interrupt status.

## TRNG HAL driver

### Parameters

|                  |                                                                                |
|------------------|--------------------------------------------------------------------------------|
| <i>base</i>      | TRNG base address                                                              |
| <i>interrupt</i> | The interrupt source to be cleared, defined by <code>trng_interrupt_t</code> . |

**72.2.4.31** `trng_status_t TRNG_HAL_SetStatisticalCheckLimit ( TRNG_Type * base, trng_statistical_check_t statistical_check, const trng_statistical_check_limit_t * limit )`

This function is used to set minimum and maximum limits of a statistical check.

### Parameters

|                          |                                                                            |
|--------------------------|----------------------------------------------------------------------------|
| <i>base</i>              | TRNG base address                                                          |
| <i>statistical_check</i> | type of statistical check defined by <code>trng_statistical_check_t</code> |
| <i>limit</i>             | Pointer to structure used to store maximum and minimum limits of statistic |

### Returns

If successful, returns the `kStatus_TRNG_Success`. Otherwise, it returns `kStatus_TRNG_InvalidArgument`.

**72.2.4.32** `void TRNG_HAL_GetStatisticalCheckLimit ( TRNG_Type * base, trng_statistical_check_t statistical_check, trng_statistical_check_limit_t * limit )`

This function is used to get current setting of minimum and maximum limits of a statistical check.

### Parameters

|                          |                                                                            |
|--------------------------|----------------------------------------------------------------------------|
| <i>base</i>              | TRNG base address                                                          |
| <i>statistical_check</i> | Type of statistical check defined by <code>trng_statistical_check_t</code> |
| <i>limit</i>             | Pointer to structure used to store maximum and minimum limits of statistic |

Returns

minimum and maximum limits of a statistical check

### 72.2.4.33 `uint32_t TRNG_HAL_ReadEntropy ( TRNG_Type * base, uint32_t index )`

This function gets an entropy data from TRNG. Entropy data is spread over TRNG\_ENT\_COUNT registers. Read register number is defined by index parameter. Entropy data is valid only if [TRNG\\_HAL\\_GetEntropyValidCmd\(\)](#) returns 1.

Parameters

|              |                                                                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>  | TRNG base address                                                                                                                                                                                                                                        |
| <i>index</i> | TRNG entropy register index. It is rounded by module TRNG_ENT_COUNT by the function, to be sure that register index is set to value from 0 till (TRNG_ENT_COUNT-1) and to allow incrementing of the index without the limit control from an application. |

Returns

32bit entropy data

### 72.2.4.34 `trng_status_t TRNG_HAL_GetStatus ( TRNG_Type * base )`

This function gets current status after the TRNG entropy generation.

Parameters

|             |                   |
|-------------|-------------------|
| <i>base</i> | TRNG base address |
|-------------|-------------------|

Returns

TRNG status. It can be `kStatus_TRNG_Success` if no error, `kStatus_TRNG_Error` if any error with any combination of `kStatus_TRNG_TestFailRunBit1Sampling0`, `kStatus_TRNG_TestFailRunBit1Sampling1`, `kStatus_TRNG_TestFailRunBit2Sampling0`, `kStatus_TRNG_TestFailRunBit2Sampling1`, `kStatus_TRNG_TestFailRunBit3Sampling0`, `kStatus_TRNG_TestFailRunBit3Sampling1`, `kStatus_TRNG_TestFailRunBit4Sampling0`, `kStatus_TRNG_TestFailRunBit4Sampling1`, `kStatus_TRNG_TestFailRunBit5Sampling0`, `kStatus_TRNG_TestFailRunBit5Sampling1`, `kStatus_TRNG_TestFailRunBit6PlusSampling0`, `kStatus_TRNG_TestFailRunBit6PlusSampling1`, `kStatus_TRNG_TestFailSparseBit`, `kStatus_TRNG_TestFailLongRun`, `kStatus_TRNG_TestFailPoker`, `kStatus_TRNG_TestFailMonoBit`, `kStatus_TRNG_TestFailFrequencyCount`.

## TRNG Peripheral Driver

### 72.3 TRNG Peripheral Driver

#### 72.3.1 Overview

This chapter describes the programming interface of the TRNG Peripheral driver. The TRNG driver provides an easy way to initialize and configure the TRNG.

#### 72.3.2 TRNG Initialization

1. Define the TRNG user configuration structure. Use `TRNG_DRV_InitUserConfigDefault()` function to set it to default TRNG configuration values.
2. Initialize the TRNG module, call the `TRNG_DRV_Init()` function and pass the user configuration structure. This function automatically enables the TRNG module and its clock. After that, the TRNG is enabled and the entropy generation starts working.
3. To disable the TRNG module, call the `TRNG_DRV_Deinit()` function.

#### 72.3.3 Get random data from TRNG

1. `TRNG_DRV_GetRandomData()` function gets random data from the TRNG module.

This example code shows how to initialize and get random data from the TRNG driver:

```
{
 trng_user_config_t trngConfig;
 trng_status_t status;
 uint32_t data;

 /* Initialize TRNG configuration structure.
 TRNG_DRV_InitUserConfigDefault(&trngConfig);

 /* Initialize TRNG
 status = TRNG_DRV_Init(0, &trngConfig);

 if (status == kStatus_TRNG_Success)
 {
 /* Read Random data
 if((status = TRNG_DRV_GetRandomData(0, data, sizeof(data))) == kStatus_TRNG_Success)
 {
 /* Print data
 PRINTF("Random = 0x%X\r\n", i, data);

 PRINTF("Succeed.\r\n");
 }
 else
 {
 PRINTF("TRNG GetRandomData failed! (0x%x)\r\n", status);
 }

 /* Deinitialize TRNG
 TRNG_DRV_Deinit(0);
 }
 else
 {
 PRINTF("TRNG initialization failed!\r\n");
 }
}
```

### 72.3.4 TRNG interrupt

The TRNG interrupt is used only when the TRNG\_DRV\_RTOS\_SLEEP configuration parameter is set to 1. It allows putting the calling RTOS task to "sleep" during the TRNG blocking entropy generation. The TRNG asserts an interrupt either when generated a Frequency Count Fail, Entropy Valid or Error Interrupt. By default it is enabled for RTOS and disabled for Bare Metal. It is optional and may be disabled.

1. Enable the TRNG interrupt with the TRNG\_DRV\_RTOS\_SLEEP set to 1.
2. Configure the TRNG interrupt priority using NVIC\_SetPriority(g\_trngIrqId[0], <priority>).
3. Define the TRNG IRQ function, adding fsl\_trng\_irq.c file to the application project using the TRNG driver.

Note

If MQX RTOS is used, it requires a special installation of interrupt handlers. Add the following MQX RTOS interrupt handler installation to an application before the TRNG initialization:

```
OSA_InstallIntHandler(g_trngIrqId[0], MQX_TRNG0_IRQHandler);
```

### Data Structures

- struct [trng\\_user\\_config\\_t](#)  
*Data structure for the TRNG initialization. [More...](#)*

### Macros

- #define [TRNG\\_DRV\\_RTOS\\_MULTI\\_THREAD](#) (USE\_RTOS)  
*Enables/disables multi-thread support in TRNG driver.*
- #define [TRNG\\_DRV\\_RTOS\\_SLEEP](#) (USE\_RTOS)  
*Enables/disables putting the calling task to "sleep" during the TRNG blocking entropy generation.*

### Functions

- [trng\\_status\\_t](#) [TRNG\\_DRV\\_Init](#) (uint32\_t instance, const [trng\\_user\\_config\\_t](#) \*user\_config)  
*Initializes the TRNG.*
- [trng\\_status\\_t](#) [TRNG\\_DRV\\_Deinit](#) (uint32\_t instance)  
*Shuts down the TRNG.*
- [trng\\_status\\_t](#) [TRNG\\_DRV\\_InitUserConfigDefault](#) ([trng\\_user\\_config\\_t](#) \*user\_config)  
*Initializes the user configuration structure to default values.*
- [trng\\_status\\_t](#) [TRNG\\_DRV\\_GetRandomData](#) (uint32\_t instance, void \*data, uint32\_t data\_size)  
*Gets random data.*
- void [TRNG\\_DRV\\_IRQHandler](#) (uint32\_t instance)  
*TRNG interrupt handler.*

### Variables

- TRNG\_Type \*const [g\\_trngBase](#) []

## TRNG Peripheral Driver

*Table of base addresses for TRNG instances.*

- const IRQn\_Type [g\\_trngIrqId](#) []

*Table to save TRNG IRQ enumeration numbers defined in the CMSIS header file.*

### 72.3.5 Data Structure Documentation

#### 72.3.5.1 struct trng\_user\_config\_t

This structure initializes the TRNG by calling the the [TRNG\\_DRV\\_Init\(\)](#) function. It contains all TRNG configurations.

#### Data Fields

- bool [lock](#)  
*Disable programmability of TRNG registers.*
- [trng\\_clock\\_mode\\_t](#) [clockMode](#)  
*Clock mode used to operate TRNG.*
- [trng\\_ring\\_osc\\_div\\_t](#) [ringOscDiv](#)  
*Ring oscillator divide used by TRNG.*
- [trng\\_sample\\_mode\\_t](#) [sampleMode](#)  
*Sample mode of the TRNG ring oscillator.*
- [uint16\\_t](#) [entropyDelay](#)  
*Entropy Delay.*
- [uint16\\_t](#) [sampleSize](#)  
*Sample Size.*
- [uint16\\_t](#) [sparseBitLimit](#)  
*Sparse Bit Limit which defines the maximum number of consecutive samples that may be discarded before an error is generated.*
- [uint8\\_t](#) [retryCount](#)  
*Retry count.*
- [uint8\\_t](#) [longRunMaxLimit](#)  
*Largest allowable number of consecutive samples of all 1, or all 0, that is allowed during the Entropy generation.*
- [trng\\_statistical\\_check\\_limit\\_t](#) [monobitLimit](#)  
*Maximum and minimum limits for statistical check of number of ones/zero detected during entropy generation.*
- [trng\\_statistical\\_check\\_limit\\_t](#) [runBit1Limit](#)  
*Maximum and minimum limits for statistical check of number of runs of length 1 detected during entropy generation.*
- [trng\\_statistical\\_check\\_limit\\_t](#) [runBit2Limit](#)  
*Maximum and minimum limits for statistical check of number of runs of length 2 detected during entropy generation.*
- [trng\\_statistical\\_check\\_limit\\_t](#) [runBit3Limit](#)  
*Maximum and minimum limits for statistical check of number of runs of length 3 detected during entropy generation.*
- [trng\\_statistical\\_check\\_limit\\_t](#) [runBit4Limit](#)  
*Maximum and minimum limits for statistical check of number of runs of length 4 detected during entropy generation.*

- [trng\\_statistical\\_check\\_limit\\_t runBit5Limit](#)  
*Maximum and minimum limits for statistical check of number of runs of length 5 detected during entropy generation.*
- [trng\\_statistical\\_check\\_limit\\_t runBit6PlusLimit](#)  
*Maximum and minimum limits for statistical check of number of runs of length 6 or more detected during entropy generation.*
- [trng\\_statistical\\_check\\_limit\\_t pokerLimit](#)  
*Maximum and minimum limits for statistical check of "Poker Test".*
- [trng\\_statistical\\_check\\_limit\\_t frequencyCountLimit](#)  
*Maximum and minimum limits for statistical check of entropy sample frequency count.*

### 72.3.5.1.0.11 Field Documentation

#### 72.3.5.1.0.11.1 `bool trng_user_config_t::lock`

Default is 0.

#### 72.3.5.1.0.11.2 `trng_clock_mode_t trng_user_config_t::clockMode`

Default is `kTRNGClockModeRingOscillator`.

#### 72.3.5.1.0.11.3 `trng_ring_osc_div_t trng_user_config_t::ringOscDiv`

Default is `kTRNGRingOscDiv0`.

#### 72.3.5.1.0.11.4 `trng_sample_mode_t trng_user_config_t::sampleMode`

Default is `kTRNGSampleModeRaw`.

#### 72.3.5.1.0.11.5 `uint16_t trng_user_config_t::entropyDelay`

Defines the length (in system clocks) of each Entropy sample taken. Default is 3200.

#### 72.3.5.1.0.11.6 `uint16_t trng_user_config_t::sampleSize`

Defines the total number of Entropy samples that will be taken during Entropy generation. Default is 2500.

#### 72.3.5.1.0.11.7 `uint16_t trng_user_config_t::sparseBitLimit`

This limit is used only for During Von Neumann sampling (enabled by [TRNG\\_HAL\\_SetSampleMode\(\)](#)). Samples are discarded if two consecutive raw samples are both 0 or both 1. If this discarding occurs for a long period of time, it indicates that there is insufficient Entropy. Default is 63.

#### 72.3.5.1.0.11.8 `uint8_t trng_user_config_t::retryCount`

It defines the number of times a statistical check may fails during the TRNG Entropy Generation before generating an error. Default is 1.

## TRNG Peripheral Driver

**72.3.5.1.0.11.9** `uint8_t trng_user_config_t::longRunMaxLimit`

Default is 34.

**72.3.5.1.0.11.10** `trng_statistical_check_limit_t trng_user_config_t::monobitLimit`

**72.3.5.1.0.11.11** `trng_statistical_check_limit_t trng_user_config_t::runBit1Limit`

**72.3.5.1.0.11.12** `trng_statistical_check_limit_t trng_user_config_t::runBit2Limit`

**72.3.5.1.0.11.13** `trng_statistical_check_limit_t trng_user_config_t::runBit3Limit`

**72.3.5.1.0.11.14** `trng_statistical_check_limit_t trng_user_config_t::runBit4Limit`

**72.3.5.1.0.11.15** `trng_statistical_check_limit_t trng_user_config_t::runBit5Limit`

**72.3.5.1.0.11.16** `trng_statistical_check_limit_t trng_user_config_t::runBit6PlusLimit`

**72.3.5.1.0.11.17** `trng_statistical_check_limit_t trng_user_config_t::pokerLimit`

**72.3.5.1.0.11.18** `trng_statistical_check_limit_t trng_user_config_t::frequencyCountLimit`

## 72.3.6 Macro Definition Documentation

### 72.3.6.1 `#define TRNG_DRV_RTOS_MULTI_THREAD (USE_RTOS)`

It is achieved by mutex locking of critical sections. and is enabled by default for RTOS. It is optional and may be disabled if TRNG is used only by one RTOS task.

### 72.3.6.2 `#define TRNG_DRV_RTOS_SLEEP (USE_RTOS)`

If enabled, it requires using of TRNG IRQ handler. and is enabled by default for RTOS. It is optional and may be disabled.

## 72.3.7 Function Documentation

### 72.3.7.1 `trng_status_t TRNG_DRV_Init ( uint32_t instance, const trng_user_config_t * user_config )`

This function initializes the TRNG. When called, the TRNG runs immediately according to the specifications in the configuration.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <i>instance</i>    | TRNG instance ID.                              |
| <i>user_config</i> | Pointer to initialize configuration structure. |

**Returns**

If successful, returns the `kStatus_TRNG_Success`. Otherwise, it returns an error.

**72.3.7.2 `trng_status_t` TRNG\_DRV\_Deinit ( `uint32_t instance` )**

This function shuts down the TRNG.

**Parameters**

|                 |                  |
|-----------------|------------------|
| <i>instance</i> | TRNG instance ID |
|-----------------|------------------|

**Returns**

If successful, returns the `kStatus_TRNG_Success`. Otherwise, it returns an error.

**72.3.7.3 `trng_status_t` TRNG\_DRV\_InitUserConfigDefault ( `trng_user_config_t * user_config` )**

This function fills the user configuration structure with default TRNG settings.

**Parameters**

|                    |                               |
|--------------------|-------------------------------|
| <i>user_config</i> | User configuration structure. |
|--------------------|-------------------------------|

**Returns**

If successful, returns the `kStatus_TRNG_Success`. Otherwise, it returns an error.

**72.3.7.4 `trng_status_t` TRNG\_DRV\_GetRandomData ( `uint32_t instance`, `void * data`, `uint32_t data_size` )**

This function gets random data from the TRNG.

## TRNG Peripheral Driver

Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <i>instance</i>  | TRNG instance ID                                 |
| <i>data</i>      | Pointer address used to store random data        |
| <i>data_size</i> | Size of the buffer pointed by the data parameter |

Returns

random data

### 72.3.7.5 void TRNG\_DRV\_IRQHandler ( uint32\_t *instance* )

This function handles the TRNG interrupt.

Parameters

|                 |                  |
|-----------------|------------------|
| <i>instance</i> | TRNG instance ID |
|-----------------|------------------|

## Chapter 73

# Touch Sense Input (TSI)

### 73.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for Touch Sense Input drivers (TSI) block of Kinetis devices

#### Modules

- [TSI HAL driver](#)
- [TSI Peripheral Driver](#)

## TSI HAL driver

### 73.2 TSI HAL driver

#### 73.2.1 Overview

The section describes the programming interface of the TSI HAL driver. The TSI HAL driver is designed to control the touch sensing input peripheral and provide basic functions to measure the RAW values of electrode capacitance.

#### Files

- file [fsl\\_tsi\\_hal.h](#)
- file [fsl\\_tsi\\_v2\\_hal\\_specific.h](#)
- file [fsl\\_tsi\\_v4\\_hal\\_specific.h](#)

#### Data Structures

- struct [tsi\\_n\\_consecutive\\_scans\\_limits\\_t](#)  
*TSI low power scan intervals limits. [More...](#)*
- struct [tsi\\_reference\\_osc\\_charge\\_current\\_limits\\_t](#)  
*TSI Reference oscillator charge current select limits. [More...](#)*
- struct [tsi\\_external\\_osc\\_charge\\_current\\_limits\\_t](#)  
*TSI External oscillator charge current select limits. [More...](#)*
- struct [tsi\\_active\\_mode\\_prescaler\\_limits\\_t](#)  
*TSI active mode prescaler limits. [More...](#)*
- struct [tsi\\_parameter\\_limits\\_t](#)  
*TSI operation mode limits. [More...](#)*
- struct [tsi\\_config\\_t](#)  
*TSI configuration structure. [More...](#)*

#### Enumerations

- enum [tsi\\_status\\_t](#) { ,  
kStatus\_TSI\_Busy,  
kStatus\_TSI\_LowPower,  
kStatus\_TSI\_Recalibration,  
kStatus\_TSI\_InvalidChannel,  
kStatus\_TSI\_InvalidMode,  
kStatus\_TSI\_Initialized,  
kStatus\_TSI\_Error }  
*Error codes for the TSI driver.*

  - *Gets the TSI STOP enable.*
  - static void [TSI\\_HAL\\_EnableHardwareTriggerScan](#) (TSI\_Type \*base)
  - *Enables the periodical (hardware) trigger scan.*
  - static void [TSI\\_HAL\\_CurrentSourcePairSwapped](#) (TSI\_Type \*base)
  - *Swaps the current sources (CURSW) of electrode oscillator and reference oscillator.*
  - static void [TSI\\_HAL\\_CurrentSourcePairNotSwapped](#) (TSI\_Type \*base)
  - *Does not swap the current sources (CURSW) of electrode oscillator and reference oscillator.*
  - static uint32\_t [TSI\\_HAL\\_GetCurrentSourcePairSwapped](#) (TSI\_Type \*base)
  - *Gets the current source pair swapped status.*
  - static void [TSI\\_HAL\\_SetMeasuredChannelNumber](#) (TSI\_Type \*base, uint32\_t channel)
  - *Sets the the measured channel number.*
  - static uint32\_t [TSI\\_HAL\\_GetMeasuredChannelNumber](#) (TSI\_Type \*base)
  - *Gets the measured channel number.*
  - static void [TSI\\_HAL\\_DmaTransferEnable](#) (TSI\_Type \*base)
  - *DMA transfer enable.*
  - static void [TSI\\_HAL\\_DmaTransferDisable](#) (TSI\_Type \*base)
  - *DMA transfer disable - does not generate DMA transfer request.*
  - static uint32\_t [TSI\\_HAL\\_IsDmaTransferEnable](#) (TSI\_Type \*base)
  - *Gets the DMA transfer enable flag.*
  - static uint32\_t [TSI\\_HAL\\_GetCounter](#) (TSI\_Type \*base)
  - *Gets the conversion counter value.*
  - static void [TSI\\_HAL\\_SetMode](#) (TSI\_Type \*base, [tsi\\_analog\\_mode\\_select\\_t](#) mode)

## TSI HAL driver

- Sets the analog mode of the TSI module.*

  - static [tsi\\_analog\\_mode\\_select\\_t TSI\\_HAL\\_GetMode](#) (TSI\_Type \*base)

*Gets the analog mode of the TSI module.*

- static [uint32\\_t TSI\\_HAL\\_GetNoiseResult](#) (TSI\_Type \*base)

*Gets the analog mode of the TSI module.*

- static void [TSI\\_HAL\\_SetOscillatorVoltageRails](#) (TSI\_Type \*base, [tsi\\_oscilator\\_voltage\\_rails\\_t](#) dvolt)

*Sets the oscillator's voltage rails.*

- static [tsi\\_oscilator\\_voltage\\_rails\\_t TSI\\_HAL\\_GetOscillatorVoltageRails](#) (TSI\_Type \*base)

*Gets the oscillator's voltage rails.*

## 73.2.2 Data Structure Documentation

### 73.2.2.1 struct [tsi\\_n\\_consecutive\\_scans\\_limits\\_t](#)

These constants define the limits of the tsi number of consecutive scans in a TSI instance.

#### Data Fields

- [tsi\\_n\\_consecutive\\_scans\\_t upper](#)  
*upper limit of number of consecutive scan*
- [tsi\\_n\\_consecutive\\_scans\\_t lower](#)  
*lower limit of number of consecutive scan*

### 73.2.2.2 struct [tsi\\_reference\\_osc\\_charge\\_current\\_limits\\_t](#)

These constants define the limits of the TSI Reference oscillator charge current select in a TSI instance.

#### Data Fields

- [tsi\\_reference\\_osc\\_charge\\_current\\_t upper](#)  
*Reference oscillator charge current upper limit.*
- [tsi\\_reference\\_osc\\_charge\\_current\\_t lower](#)  
*Reference oscillator charge current lower limit.*

### 73.2.2.3 struct [tsi\\_external\\_osc\\_charge\\_current\\_limits\\_t](#)

These constants define the limits of the TSI External oscillator charge current select in a TSI instance.

#### Data Fields

- [tsi\\_external\\_osc\\_charge\\_current\\_t upper](#)  
*External oscillator charge current upper limit.*

- [tsi\\_external\\_osc\\_charge\\_current\\_t](#) lower  
*External oscillator charge current lower limit.*

#### 73.2.2.4 struct [tsi\\_active\\_mode\\_prescaler\\_limits\\_t](#)

These constants define the limits of the TSI active mode prescaler in a TSI instance.

##### Data Fields

- [tsi\\_active\\_mode\\_prescaler\\_t](#) upper  
*Input clock source prescaler upper limit.*
- [tsi\\_active\\_mode\\_prescaler\\_t](#) lower  
*Input clock source prescaler lower limit.*

#### 73.2.2.5 struct [tsi\\_parameter\\_limits\\_t](#)

These constants is used to specify the valid range of settings for the recalibration process of TSI parameters

##### Data Fields

- [tsi\\_n\\_consecutive\\_scans\\_limits\\_t](#) consNumberOfScan  
*number of consecutive scan limits*
- [tsi\\_reference\\_osc\\_charge\\_current\\_limits\\_t](#) refOscChargeCurrent  
*Reference oscillator charge current limits.*
- [tsi\\_external\\_osc\\_charge\\_current\\_limits\\_t](#) extOscChargeCurrent  
*External oscillator charge current limits.*
- [tsi\\_active\\_mode\\_prescaler\\_limits\\_t](#) activeModePrescaler  
*Input clock source prescaler limits.*

#### 73.2.2.6 struct [tsi\\_config\\_t](#)

This structure contains the settings for the most common TSI configurations including the TSI module charge currents, number of scans, thresholds, and so on.

##### Data Fields

- [tsi\\_electrode\\_osc\\_prescaler\\_t](#) ps  
*Prescaler.*
- [tsi\\_external\\_osc\\_charge\\_current\\_t](#) extchrg  
*Electrode charge current.*
- [tsi\\_reference\\_osc\\_charge\\_current\\_t](#) refchrg  
*Reference charge current.*
- [tsi\\_n\\_consecutive\\_scans\\_t](#) nscn  
*Number of scans.*
- [tsi\\_analog\\_mode\\_select\\_t](#) mode

## TSI HAL driver

- *TSI mode of operation.*
- `tsi_oscillator_voltage_rails_t` `dvolt`  
*Oscillator's voltage rails.*
- `uint16_t` `thresh`  
*High threshold.*
- `uint16_t` `thresl`  
*Low threshold.*

### 73.2.2.6.0.12 Field Documentation

73.2.2.6.0.12.1 `tsi_n_consecutive_scans_t` `tsi_config_t::nscn`

73.2.2.6.0.12.2 `tsi_analog_mode_select_t` `tsi_config_t::mode`

73.2.2.6.0.12.3 `tsi_oscillator_voltage_rails_t` `tsi_config_t::dvolt`

73.2.2.6.0.12.4 `uint16_t` `tsi_config_t::thresh`

73.2.2.6.0.12.5 `uint16_t` `tsi_config_t::thresl`

## 73.2.3 Enumeration Type Documentation

### 73.2.3.1 enum `tsi_status_t`

Enumerator

- `kStatus_TSI_Busy`* TSI still in progress.
- `kStatus_TSI_LowPower`* TSI is in low power mode.
- `kStatus_TSI_Recalibration`* TSI is under recalibration process.
- `kStatus_TSI_InvalidChannel`* Invalid TSI channel.
- `kStatus_TSI_InvalidMode`* Invalid TSI mode.
- `kStatus_TSI_Initialized`* The driver is initialized and ready to measure.
- `kStatus_TSI_Error`* The general driver error.

### 73.2.3.2 enum `tsi_n_consecutive_scans_t`

These constants define the tsi number of consecutive scans in a TSI instance for each electrode.

Enumerator

- `kTsiConsecutiveScansNumber_1time`* once per electrode
- `kTsiConsecutiveScansNumber_2time`* twice per electrode
- `kTsiConsecutiveScansNumber_3time`* 3 times consecutive scan
- `kTsiConsecutiveScansNumber_4time`* 4 times consecutive scan
- `kTsiConsecutiveScansNumber_5time`* 5 times consecutive scan
- `kTsiConsecutiveScansNumber_6time`* 6 times consecutive scan
- `kTsiConsecutiveScansNumber_7time`* 7 times consecutive scan

|                                          |                           |
|------------------------------------------|---------------------------|
| <i>kTsiConsecutiveScansNumber_8time</i>  | 8 times consecutive scan  |
| <i>kTsiConsecutiveScansNumber_9time</i>  | 9 times consecutive scan  |
| <i>kTsiConsecutiveScansNumber_10time</i> | 10 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_11time</i> | 11 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_12time</i> | 12 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_13time</i> | 13 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_14time</i> | 14 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_15time</i> | 15 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_16time</i> | 16 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_17time</i> | 17 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_18time</i> | 18 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_19time</i> | 19 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_20time</i> | 20 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_21time</i> | 21 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_22time</i> | 22 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_23time</i> | 23 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_24time</i> | 24 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_25time</i> | 25 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_26time</i> | 26 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_27time</i> | 27 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_28time</i> | 28 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_29time</i> | 29 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_30time</i> | 30 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_31time</i> | 31 times consecutive scan |
| <i>kTsiConsecutiveScansNumber_32time</i> | 32 times consecutive scan |

### 73.2.3.3 enum tsi\_electrode\_osc\_prescaler\_t

These constants define the tsi electrode oscillator prescaler in a TSI instance.

Enumerator

|                                    |                                                |
|------------------------------------|------------------------------------------------|
| <i>kTsiElecOscPrescaler_1div</i>   | Electrode oscillator frequency divided by 1.   |
| <i>kTsiElecOscPrescaler_2div</i>   | Electrode oscillator frequency divided by 2.   |
| <i>kTsiElecOscPrescaler_4div</i>   | Electrode oscillator frequency divided by 4.   |
| <i>kTsiElecOscPrescaler_8div</i>   | Electrode oscillator frequency divided by 8.   |
| <i>kTsiElecOscPrescaler_16div</i>  | Electrode oscillator frequency divided by 16.  |
| <i>kTsiElecOscPrescaler_32div</i>  | Electrode oscillator frequency divided by 32.  |
| <i>kTsiElecOscPrescaler_64div</i>  | Electrode oscillator frequency divided by 64.  |
| <i>kTsiElecOscPrescaler_128div</i> | Electrode oscillator frequency divided by 128. |

### 73.2.3.4 enum tsi\_low\_power\_interval\_t

These constants define the tsi low power scan intervals in a TSI instance.

## TSI HAL driver

### Enumerator

|                                   |                     |
|-----------------------------------|---------------------|
| <i>kTsiLowPowerInterval_1ms</i>   | 1ms scan interval   |
| <i>kTsiLowPowerInterval_5ms</i>   | 5ms scan interval   |
| <i>kTsiLowPowerInterval_10ms</i>  | 10ms scan interval  |
| <i>kTsiLowPowerInterval_15ms</i>  | 15ms scan interval  |
| <i>kTsiLowPowerInterval_20ms</i>  | 20ms scan interval  |
| <i>kTsiLowPowerInterval_30ms</i>  | 30ms scan interval  |
| <i>kTsiLowPowerInterval_40ms</i>  | 40ms scan interval  |
| <i>kTsiLowPowerInterval_50ms</i>  | 50ms scan interval  |
| <i>kTsiLowPowerInterval_75ms</i>  | 75ms scan interval  |
| <i>kTsiLowPowerInterval_100ms</i> | 100ms scan interval |
| <i>kTsiLowPowerInterval_125ms</i> | 125ms scan interval |
| <i>kTsiLowPowerInterval_150ms</i> | 150ms scan interval |
| <i>kTsiLowPowerInterval_200ms</i> | 200ms scan interval |
| <i>kTsiLowPowerInterval_300ms</i> | 300ms scan interval |
| <i>kTsiLowPowerInterval_400ms</i> | 400ms scan interval |
| <i>kTsiLowPowerInterval_500ms</i> | 500ms scan interval |

### 73.2.3.5 enum tsi\_reference\_osc\_charge\_current\_t

These constants define the tsi Reference oscillator charge current select in a TSI instance.

### Enumerator

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <i>kTsiRefOscChargeCurrent_2uA</i>   | Reference oscillator charge current is 2uA.   |
| <i>kTsiRefOscChargeCurrent_4uA</i>   | Reference oscillator charge current is 4uA.   |
| <i>kTsiRefOscChargeCurrent_6uA</i>   | Reference oscillator charge current is 6uA.   |
| <i>kTsiRefOscChargeCurrent_8uA</i>   | Reference oscillator charge current is 8uA.   |
| <i>kTsiRefOscChargeCurrent_10uA</i>  | Reference oscillator charge current is 10uA.  |
| <i>kTsiRefOscChargeCurrent_12uA</i>  | Reference oscillator charge current is 12uA.  |
| <i>kTsiRefOscChargeCurrent_14uA</i>  | Reference oscillator charge current is 14uA.  |
| <i>kTsiRefOscChargeCurrent_16uA</i>  | Reference oscillator charge current is 16uA.  |
| <i>kTsiRefOscChargeCurrent_18uA</i>  | Reference oscillator charge current is 18uA.  |
| <i>kTsiRefOscChargeCurrent_20uA</i>  | Reference oscillator charge current is 20uA.  |
| <i>kTsiRefOscChargeCurrent_22uA</i>  | Reference oscillator charge current is 22uA.  |
| <i>kTsiRefOscChargeCurrent_24uA</i>  | Reference oscillator charge current is 24uA.  |
| <i>kTsiRefOscChargeCurrent_26uA</i>  | Reference oscillator charge current is 26uA.  |
| <i>kTsiRefOscChargeCurrent_28uA</i>  | Reference oscillator charge current is 28uA.  |
| <i>kTsiRefOscChargeCurrent_30uA</i>  | Reference oscillator charge current is 30uA.  |
| <i>kTsiRefOscChargeCurrent_32uA</i>  | Reference oscillator charge current is 32uA.  |
| <i>kTsiRefOscChargeCurrent_500nA</i> | Reference oscillator charge current is 500nA. |
| <i>kTsiRefOscChargeCurrent_1uA</i>   | Reference oscillator charge current is 1uA.   |
| <i>kTsiRefOscChargeCurrent_2uA</i>   | Reference oscillator charge current is 2uA.   |
| <i>kTsiRefOscChargeCurrent_4uA</i>   | Reference oscillator charge current is 4uA.   |

*kTsiRefOscChargeCurrent\_8uA* Reference oscillator charge current is 8uA.  
*kTsiRefOscChargeCurrent\_16uA* Reference oscillator charge current is 16uA.  
*kTsiRefOscChargeCurrent\_32uA* Reference oscillator charge current is 32uA.  
*kTsiRefOscChargeCurrent\_64uA* Reference oscillator charge current is 64uA.

### 73.2.3.6 enum tsi\_external\_osc\_charge\_current\_t

These constants define the tsi External oscillator charge current select in a TSI instance.

Enumerator

*kTsiExtOscChargeCurrent\_2uA* External oscillator charge current is 2uA.  
*kTsiExtOscChargeCurrent\_4uA* External oscillator charge current is 4uA.  
*kTsiExtOscChargeCurrent\_6uA* External oscillator charge current is 6uA.  
*kTsiExtOscChargeCurrent\_8uA* External oscillator charge current is 8uA.  
*kTsiExtOscChargeCurrent\_10uA* External oscillator charge current is 10uA.  
*kTsiExtOscChargeCurrent\_12uA* External oscillator charge current is 12uA.  
*kTsiExtOscChargeCurrent\_14uA* External oscillator charge current is 14uA.  
*kTsiExtOscChargeCurrent\_16uA* External oscillator charge current is 16uA.  
*kTsiExtOscChargeCurrent\_18uA* External oscillator charge current is 18uA.  
*kTsiExtOscChargeCurrent\_20uA* External oscillator charge current is 20uA.  
*kTsiExtOscChargeCurrent\_22uA* External oscillator charge current is 22uA.  
*kTsiExtOscChargeCurrent\_24uA* External oscillator charge current is 24uA.  
*kTsiExtOscChargeCurrent\_26uA* External oscillator charge current is 26uA.  
*kTsiExtOscChargeCurrent\_28uA* External oscillator charge current is 28uA.  
*kTsiExtOscChargeCurrent\_30uA* External oscillator charge current is 30uA.  
*kTsiExtOscChargeCurrent\_32uA* External oscillator charge current is 32uA.  
*kTsiExtOscChargeCurrent\_500nA* External oscillator charge current is 500nA.  
*kTsiExtOscChargeCurrent\_1uA* External oscillator charge current is 1uA.  
*kTsiExtOscChargeCurrent\_2uA* External oscillator charge current is 2uA.  
*kTsiExtOscChargeCurrent\_4uA* External oscillator charge current is 4uA.  
*kTsiExtOscChargeCurrent\_8uA* External oscillator charge current is 8uA.  
*kTsiExtOscChargeCurrent\_16uA* External oscillator charge current is 16uA.  
*kTsiExtOscChargeCurrent\_32uA* External oscillator charge current is 32uA.  
*kTsiExtOscChargeCurrent\_64uA* External oscillator charge current is 64uA.

### 73.2.3.7 enum tsi\_internal\_cap\_trim\_t

These constants define the tsi Internal capacitance trim value in a TSI instance.

Enumerator

*kTsiIntCapTrim\_0\_5pF* 0.5 pF internal reference capacitance  
*kTsiIntCapTrim\_0\_6pF* 0.6 pF internal reference capacitance

## TSI HAL driver

|                             |                                       |
|-----------------------------|---------------------------------------|
| <i>kTsiIntCapTrim_0_7pF</i> | 0.7 pF internal reference capacitance |
| <i>kTsiIntCapTrim_0_8pF</i> | 0.8 pF internal reference capacitance |
| <i>kTsiIntCapTrim_0_9pF</i> | 0.9 pF internal reference capacitance |
| <i>kTsiIntCapTrim_1_0pF</i> | 1.0 pF internal reference capacitance |
| <i>kTsiIntCapTrim_1_1pF</i> | 1.1 pF internal reference capacitance |
| <i>kTsiIntCapTrim_1_2pF</i> | 1.2 pF internal reference capacitance |

### 73.2.3.8 enum tsi\_osc\_delta\_voltage\_t

These constants define the tsi Delta voltage applied to analog oscillators in a TSI instance.

Enumerator

|                                  |                                 |
|----------------------------------|---------------------------------|
| <i>kTsiOscDeltaVoltage_100mV</i> | 100 mV delta voltage is applied |
| <i>kTsiOscDeltaVoltage_150mV</i> | 150 mV delta voltage is applied |
| <i>kTsiOscDeltaVoltage_200mV</i> | 200 mV delta voltage is applied |
| <i>kTsiOscDeltaVoltage_250mV</i> | 250 mV delta voltage is applied |
| <i>kTsiOscDeltaVoltage_300mV</i> | 300 mV delta voltage is applied |
| <i>kTsiOscDeltaVoltage_400mV</i> | 400 mV delta voltage is applied |
| <i>kTsiOscDeltaVoltage_500mV</i> | 500 mV delta voltage is applied |
| <i>kTsiOscDeltaVoltage_600mV</i> | 600 mV delta voltage is applied |

### 73.2.3.9 enum tsi\_active\_mode\_clock\_divider\_t

These constants define the active mode clock divider in a TSI instance.

Enumerator

|                                 |                                           |
|---------------------------------|-------------------------------------------|
| <i>kTsiActiveClkDiv_1div</i>    | Active mode clock divider is set to 1.    |
| <i>kTsiActiveClkDiv_2048div</i> | Active mode clock divider is set to 2048. |

### 73.2.3.10 enum tsi\_active\_mode\_clock\_source\_t

These constants define the active mode clock source in a TSI instance.

Enumerator

|                                     |                                                                  |
|-------------------------------------|------------------------------------------------------------------|
| <i>kTsiActiveClkSource_BusClock</i> | Active mode clock source is set to Bus Clock.                    |
| <i>kTsiActiveClkSource_MCGIRCLK</i> | Active mode clock source is set to MCG Internal reference clock. |
| <i>kTsiActiveClkSource_OSCERCLK</i> | Active mode clock source is set to System oscillator output.     |

### 73.2.3.11 enum tsi\_active\_mode\_prescaler\_t

These constants define the tsi active mode prescaler in a TSI instance.

Enumerator

|                                       |                                    |
|---------------------------------------|------------------------------------|
| <i>kTsiActiveModePrescaler_1div</i>   | Input clock source divided by 1.   |
| <i>kTsiActiveModePrescaler_2div</i>   | Input clock source divided by 2.   |
| <i>kTsiActiveModePrescaler_4div</i>   | Input clock source divided by 4.   |
| <i>kTsiActiveModePrescaler_8div</i>   | Input clock source divided by 8.   |
| <i>kTsiActiveModePrescaler_16div</i>  | Input clock source divided by 16.  |
| <i>kTsiActiveModePrescaler_32div</i>  | Input clock source divided by 32.  |
| <i>kTsiActiveModePrescaler_64div</i>  | Input clock source divided by 64.  |
| <i>kTsiActiveModePrescaler_128div</i> | Input clock source divided by 128. |

### 73.2.3.12 enum tsi\_analog\_mode\_select\_t

Set up TSI analog modes in a TSI instance.

Enumerator

|                                         |                                                                                               |
|-----------------------------------------|-----------------------------------------------------------------------------------------------|
| <i>kTsiAnalogModeSel_Capacitive</i>     | Active TSI capacitive sensing mode.                                                           |
| <i>kTsiAnalogModeSel_NoiseNoFreqLim</i> | TSI works in single threshold noise detection mode and the freq. limitation is disabled       |
| <i>kTsiAnalogModeSel_NoiseFreqLim</i>   | TSI analog works in single threshold noise detection mode and the freq. limitation is enabled |

### 73.2.3.13 enum tsi\_reference\_osc\_charge\_current\_t

These constants define the tsi Reference oscillator charge current select in a TSI (REFCHRG) instance.

Enumerator

|                                     |                                              |
|-------------------------------------|----------------------------------------------|
| <i>kTsiRefOscChargeCurrent_2uA</i>  | Reference oscillator charge current is 2uA.  |
| <i>kTsiRefOscChargeCurrent_4uA</i>  | Reference oscillator charge current is 4uA.  |
| <i>kTsiRefOscChargeCurrent_6uA</i>  | Reference oscillator charge current is 6uA.  |
| <i>kTsiRefOscChargeCurrent_8uA</i>  | Reference oscillator charge current is 8uA.  |
| <i>kTsiRefOscChargeCurrent_10uA</i> | Reference oscillator charge current is 10uA. |
| <i>kTsiRefOscChargeCurrent_12uA</i> | Reference oscillator charge current is 12uA. |
| <i>kTsiRefOscChargeCurrent_14uA</i> | Reference oscillator charge current is 14uA. |
| <i>kTsiRefOscChargeCurrent_16uA</i> | Reference oscillator charge current is 16uA. |
| <i>kTsiRefOscChargeCurrent_18uA</i> | Reference oscillator charge current is 18uA. |
| <i>kTsiRefOscChargeCurrent_20uA</i> | Reference oscillator charge current is 20uA. |
| <i>kTsiRefOscChargeCurrent_22uA</i> | Reference oscillator charge current is 22uA. |

## TSI HAL driver

|                                      |                                               |
|--------------------------------------|-----------------------------------------------|
| <i>kTsiRefOscChargeCurrent_24uA</i>  | Reference oscillator charge current is 24uA.  |
| <i>kTsiRefOscChargeCurrent_26uA</i>  | Reference oscillator charge current is 26uA.  |
| <i>kTsiRefOscChargeCurrent_28uA</i>  | Reference oscillator charge current is 28uA.  |
| <i>kTsiRefOscChargeCurrent_30uA</i>  | Reference oscillator charge current is 30uA.  |
| <i>kTsiRefOscChargeCurrent_32uA</i>  | Reference oscillator charge current is 32uA.  |
| <i>kTsiRefOscChargeCurrent_500nA</i> | Reference oscillator charge current is 500nA. |
| <i>kTsiRefOscChargeCurrent_1uA</i>   | Reference oscillator charge current is 1uA.   |
| <i>kTsiRefOscChargeCurrent_2uA</i>   | Reference oscillator charge current is 2uA.   |
| <i>kTsiRefOscChargeCurrent_4uA</i>   | Reference oscillator charge current is 4uA.   |
| <i>kTsiRefOscChargeCurrent_8uA</i>   | Reference oscillator charge current is 8uA.   |
| <i>kTsiRefOscChargeCurrent_16uA</i>  | Reference oscillator charge current is 16uA.  |
| <i>kTsiRefOscChargeCurrent_32uA</i>  | Reference oscillator charge current is 32uA.  |
| <i>kTsiRefOscChargeCurrent_64uA</i>  | Reference oscillator charge current is 64uA.  |

### 73.2.3.14 enum tsi\_oscilator\_voltage\_rails\_t

These bits indicate the oscillator's voltage rails.

Enumerator

|                               |                                        |
|-------------------------------|----------------------------------------|
| <i>kTsiOscVolRails_Dv_103</i> | DV = 1.03 V; VP = 1.33 V; Vm = 0.30 V. |
| <i>kTsiOscVolRails_Dv_073</i> | DV = 0.73 V; VP = 1.18 V; Vm = 0.45 V. |
| <i>kTsiOscVolRails_Dv_043</i> | DV = 0.43 V; VP = 1.03 V; Vm = 0.60 V. |
| <i>kTsiOscVolRails_Dv_029</i> | DV = 0.29 V; VP = 0.95 V; Vm = 0.67 V. |

### 73.2.3.15 enum tsi\_external\_osc\_charge\_current\_t

These bits indicate the electrode oscillator charge and discharge current value in TSI (EXTCHRG) instance.

Enumerator

|                                     |                                             |
|-------------------------------------|---------------------------------------------|
| <i>kTsiExtOscChargeCurrent_2uA</i>  | External oscillator charge current is 2uA.  |
| <i>kTsiExtOscChargeCurrent_4uA</i>  | External oscillator charge current is 4uA.  |
| <i>kTsiExtOscChargeCurrent_6uA</i>  | External oscillator charge current is 6uA.  |
| <i>kTsiExtOscChargeCurrent_8uA</i>  | External oscillator charge current is 8uA.  |
| <i>kTsiExtOscChargeCurrent_10uA</i> | External oscillator charge current is 10uA. |
| <i>kTsiExtOscChargeCurrent_12uA</i> | External oscillator charge current is 12uA. |
| <i>kTsiExtOscChargeCurrent_14uA</i> | External oscillator charge current is 14uA. |
| <i>kTsiExtOscChargeCurrent_16uA</i> | External oscillator charge current is 16uA. |
| <i>kTsiExtOscChargeCurrent_18uA</i> | External oscillator charge current is 18uA. |
| <i>kTsiExtOscChargeCurrent_20uA</i> | External oscillator charge current is 20uA. |
| <i>kTsiExtOscChargeCurrent_22uA</i> | External oscillator charge current is 22uA. |
| <i>kTsiExtOscChargeCurrent_24uA</i> | External oscillator charge current is 24uA. |

*kTsiExtOscChargeCurrent\_26uA* External oscillator charge current is 26uA.  
*kTsiExtOscChargeCurrent\_28uA* External oscillator charge current is 28uA.  
*kTsiExtOscChargeCurrent\_30uA* External oscillator charge current is 30uA.  
*kTsiExtOscChargeCurrent\_32uA* External oscillator charge current is 32uA.  
*kTsiExtOscChargeCurrent\_500nA* External oscillator charge current is 500nA.  
*kTsiExtOscChargeCurrent\_1uA* External oscillator charge current is 1uA.  
*kTsiExtOscChargeCurrent\_2uA* External oscillator charge current is 2uA.  
*kTsiExtOscChargeCurrent\_4uA* External oscillator charge current is 4uA.  
*kTsiExtOscChargeCurrent\_8uA* External oscillator charge current is 8uA.  
*kTsiExtOscChargeCurrent\_16uA* External oscillator charge current is 16uA.  
*kTsiExtOscChargeCurrent\_32uA* External oscillator charge current is 32uA.  
*kTsiExtOscChargeCurrent\_64uA* External oscillator charge current is 64uA.

### 73.2.3.16 enum tsi\_channel\_number\_t

These bits specify current channel to be measured.

Enumerator

*kTsiChannelNumber\_0* Channel Number 0.  
*kTsiChannelNumber\_1* Channel Number 1.  
*kTsiChannelNumber\_2* Channel Number 2.  
*kTsiChannelNumber\_3* Channel Number 3.  
*kTsiChannelNumber\_4* Channel Number 4.  
*kTsiChannelNumber\_5* Channel Number 5.  
*kTsiChannelNumber\_6* Channel Number 6.  
*kTsiChannelNumber\_7* Channel Number 7.  
*kTsiChannelNumber\_8* Channel Number 8.  
*kTsiChannelNumber\_9* Channel Number 9.  
*kTsiChannelNumber\_10* Channel Number 10.  
*kTsiChannelNumber\_11* Channel Number 11.  
*kTsiChannelNumber\_12* Channel Number 12.  
*kTsiChannelNumber\_13* Channel Number 13.  
*kTsiChannelNumber\_14* Channel Number 14.  
*kTsiChannelNumber\_15* Channel Number 15.

## 73.2.4 Function Documentation

### 73.2.4.1 void TSI\_HAL\_Init ( TSI\_Type \* *base* )

## TSI HAL driver

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

none

Initialize the peripheral to default state.

### 73.2.4.2 void TSI\_HAL\_SetConfiguration ( TSI\_Type \* *base*, tsi\_config\_t \* *config* )

Parameters

|               |                                                |
|---------------|------------------------------------------------|
| <i>base</i>   | TSI module base address.                       |
| <i>config</i> | Pointer to TSI module configuration structure. |

Returns

none

Initialize and sets prescalers, number of scans, clocks, delta voltage capacitance trimmer, reference and electrode charge current and threshold.

### 73.2.4.3 uint32\_t TSI\_HAL\_Recalibrate ( TSI\_Type \* *base*, tsi\_config\_t \* *config*, const uint32\_t *electrodes*, const tsi\_parameter\_limits\_t \* *parLimits* )

Parameters

|                   |                                                   |
|-------------------|---------------------------------------------------|
| <i>base</i>       | TSI module base address.                          |
| <i>config</i>     | Pointer to TSI module configuration structure.    |
| <i>electrodes</i> | The map of the electrodes.                        |
| <i>parLimits</i>  | Pointer to TSI module parameter limits structure. |

Returns

Lowest signal

This function if TSI basic module is enable, than disable him and if module has enabled interrupt, disable him. Then Set prescaler, electrode and reference current, number of scan and voltage rails. Enable module and interrupt if is not. Better if you see implimentation of this function for better understanding [TSI\\_HAL\\_Recalibrate](#).

**73.2.4.4 void TSI\_HAL\_EnableLowPower ( TSI\_Type \* *base* )**

## TSI HAL driver

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

none

### 73.2.4.5 void TSI\_HAL\_DisableLowPower ( TSI\_Type \* *base* )

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

### 73.2.4.6 static uint32\_t TSI\_HAL\_IsModuleEnabled ( TSI\_Type \* *base* ) [inline], [static]

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

State of enable module flag.

### 73.2.4.7 static uint32\_t TSI\_HAL\_GetScanTriggerMode ( TSI\_Type \* *base* ) [inline], [static]

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Scan trigger mode.

**73.2.4.8** `static uint32_t TSI_HAL_IsScanInProgress ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

True - if scan is in progress. False - otherwise

**73.2.4.9** `static uint32_t TSI_HAL_GetEndOfScanFlag ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Current state of end of scan flag.

**73.2.4.10** `static uint32_t TSI_HAL_GetOutOfRangeFlag ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

## TSI HAL driver

Returns

State of out of range flag.

**73.2.4.11** `static tsi_electrode_osc_prescaler_t TSI_HAL_GetPrescaler ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Prescaler value.

**73.2.4.12** `static tsi_n_consecutive_scans_t TSI_HAL_GetNumberOfScans ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Number of scans.

**73.2.4.13** `static void TSI_HAL_EnableModule ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.14** `static void TSI_HAL_DisableModule ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.15** `static void TSI_HAL_EnableStop ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.16** `static void TSI_HAL_DisableStop ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.17** `static void TSI_HAL_EnableOutOfRangeInterrupt ( TSI_Type * base ) [inline], [static]`

## TSI HAL driver

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

None.

**73.2.4.18** `static void TSI_HAL_EnableEndOfScanInterrupt ( TSI_Type * base )  
[inline], [static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

None.

**73.2.4.19** `static void TSI_HAL_EnablePeriodicalScan ( TSI_Type * base ) [inline],  
[static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

None.

**73.2.4.20** `static void TSI_HAL_EnableSoftwareTriggerScan ( TSI_Type * base )  
[inline], [static]`

### Parameters

---

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.21 static void TSI\_HAL\_EnableErrorInterrupt ( TSI\_Type \* *base* ) [inline], [static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.22 static void TSI\_HAL\_DisableErrorInterrupt ( TSI\_Type \* *base* ) [inline], [static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.23 static void TSI\_HAL\_ClearOutOfRangeFlag ( TSI\_Type \* *base* ) [inline], [static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

## TSI HAL driver

Returns

None.

**73.2.4.24** `static void TSI_HAL_ClearEndOfScanFlag ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.25** `static void TSI_HAL_EnableInterrupt ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.26** `static void TSI_HAL_DisableInterrupt ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.27** `static uint32_t TSI_HAL_IsInterruptEnabled ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

State of enable interrupt flag.

**73.2.4.28** `static void TSI_HAL_StartSoftwareTrigger ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.29** `static uint32_t TSI_HAL_IsOverrun ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

State of over run flag.

**73.2.4.30** `static void TSI_HAL_ClearOverrunFlag ( TSI_Type * base ) [inline], [static]`

## TSI HAL driver

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

None.

**73.2.4.31** `static uint32_t TSI_HAL_GetExternalElectrodeErrorFlag ( TSI_Type * base ) [inline], [static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

State of external electrode error flag

**73.2.4.32** `static void TSI_HAL_ClearExternalElectrodeErrorFlag ( TSI_Type * base ) [inline], [static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

None.

**73.2.4.33** `static void TSI_HAL_SetPrescaler ( TSI_Type * base, tsi_electrode_osc_prescaler_t prescaler ) [inline], [static]`

### Parameters

---

|                  |                          |
|------------------|--------------------------|
| <i>base</i>      | TSI module base address. |
| <i>prescaler</i> | Prescaler value.         |

Returns

None.

**73.2.4.34** `static void TSI_HAL_SetNumberOfScans ( TSI_Type * base,  
tsi_n_consecutive_scans_t number ) [inline], [static]`

Parameters

|               |                          |
|---------------|--------------------------|
| <i>base</i>   | TSI module base address. |
| <i>number</i> | Number of scans.         |

Returns

None.

**73.2.4.35** `static void TSI_HAL_SetLowPowerScanInterval ( TSI_Type * base,  
tsi_low_power_interval_t interval ) [inline], [static]`

Parameters

|                 |                              |
|-----------------|------------------------------|
| <i>base</i>     | TSI module base address.     |
| <i>interval</i> | Interval for low power scan. |

Returns

None.

**73.2.4.36** `static tsi_low_power_interval_t TSI_HAL_GetLowPowerScanInterval ( TSI_Type  
* base ) [inline], [static]`

## TSI HAL driver

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

Interval for low power scan.

**73.2.4.37** `static void TSI_HAL_SetLowPowerClock ( TSI_Type * base, uint32_t clock ) [inline], [static]`

### Parameters

|              |                            |
|--------------|----------------------------|
| <i>base</i>  | TSI module base address.   |
| <i>clock</i> | Low power clock selection. |

**73.2.4.38** `static uint32_t TSI_HAL_GetLowPowerClock ( TSI_Type * base ) [inline], [static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

Low power clock selection.

**73.2.4.39** `static void TSI_HAL_SetReferenceChargeCurrent ( TSI_Type * base, tsi_reference_osc_charge_current_t current ) [inline], [static]`

### Parameters

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>current</i> | The charge current.      |

Returns

None.

**73.2.4.40** `static tsi_reference_osc_charge_current_t TSI_HAL_GetReferenceChargeCurrent ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

The charge current.

**73.2.4.41** `static void TSI_HAL_SetElectrodeChargeCurrent ( TSI_Type * base, tsi_external_osc_charge_current_t current ) [inline], [static]`

Parameters

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>current</i> | Electrode current.       |

Returns

None.

**73.2.4.42** `static tsi_external_osc_charge_current_t TSI_HAL_GetElectrodeChargeCurrent ( TSI_Type * base ) [inline], [static]`

Parameters

---

## TSI HAL driver

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Charge current.

**73.2.4.43** `static void TSI_HAL_SetScanModulo ( TSI_Type * base, uint32_t modulo ) [inline], [static]`

Parameters

|               |                          |
|---------------|--------------------------|
| <i>base</i>   | TSI module base address. |
| <i>modulo</i> | Scan modulo value.       |

Returns

None.

**73.2.4.44** `static uint32_t TSI_HAL_GetScanModulo ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Scan modulo value.

**73.2.4.45** `static void TSI_HAL_SetActiveModeSource ( TSI_Type * base, uint32_t source ) [inline], [static]`

Parameters

---

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>base</i>   | TSI module base address.                                 |
| <i>source</i> | Active mode clock source (LPOSCCLK, MCGIRCLK, OSCERCLK). |

Returns

None.

**73.2.4.46** `static uint32_t TSI_HAL_GetActiveModeSource ( TSI_Type * base )  
[inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Source value.

**73.2.4.47** `static void TSI_HAL_SetActiveModePrescaler ( TSI_Type * base,  
tsi_active_mode_prescaler_t prescaler ) [inline], [static]`

Parameters

|                  |                          |
|------------------|--------------------------|
| <i>base</i>      | TSI module base address. |
| <i>prescaler</i> | Prescaler's value.       |

Returns

None.

**73.2.4.48** `static uint32_t TSI_HAL_GetActiveModePrescaler ( TSI_Type * base )  
[inline], [static]`

Parameters

## TSI HAL driver

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Prescaler's value.

**73.2.4.49** `static void TSI_HAL_SetLowPowerChannel ( TSI_Type * base, uint32_t channel ) [inline], [static]`

Only one channel can wake up MCU.

Parameters

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>channel</i> | Channel number.          |

Returns

None.

**73.2.4.50** `static uint32_t TSI_HAL_GetLowPowerChannel ( TSI_Type * base ) [inline], [static]`

Only one channel can wake up MCU.

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Channel number.

**73.2.4.51** `static void TSI_HAL_EnableChannel ( TSI_Type * base, uint32_t channel ) [inline], [static]`

## Parameters

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>channel</i> | Channel to be enabled.   |

## Returns

None.

**73.2.4.52 static void TSI\_HAL\_EnableChannels ( TSI\_Type \* *base*, uint32\_t *channelsMask* ) [inline], [static]**

The function enables channels by mask. It can set all at once.

## Parameters

|                     |                              |
|---------------------|------------------------------|
| <i>base</i>         | TSI module base address.     |
| <i>channelsMask</i> | Channels mask to be enabled. |

## Returns

None.

**73.2.4.53 static void TSI\_HAL\_DisableChannel ( TSI\_Type \* *base*, uint32\_t *channel* ) [inline], [static]**

## Parameters

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>channel</i> | Channel to be disabled.  |

## Returns

None.

**73.2.4.54 static void TSI\_HAL\_DisableChannels ( TSI\_Type \* *base*, uint32\_t *channelsMask* ) [inline], [static]**

The function disables channels by mask. It can set all at once.

## TSI HAL driver

### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <i>base</i>         | TSI module base address.      |
| <i>channelsMask</i> | Channels mask to be disabled. |

### Returns

None.

**73.2.4.55** `static uint32_t TSI_HAL_GetEnabledChannel ( TSI_Type * base, uint32_t channel ) [inline], [static]`

### Parameters

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>channel</i> | Channel to be checked.   |

### Returns

True - if channel is enabled, false - otherwise.

**73.2.4.56** `static uint32_t TSI_HAL_GetEnabledChannels ( TSI_Type * base ) [inline], [static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

Channels mask that are enabled.

**73.2.4.57** `static uint16_t TSI_HAL_GetWakeUpChannelCounter ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Wake up counter value.

**73.2.4.58** `static uint32_t TSI_HAL_GetCounter ( TSI_Type * base, uint32_t channel ) [inline], [static]`

Parameters

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>channel</i> | Index of TSI channel.    |

Returns

The counter value.

**73.2.4.59** `static void TSI_HAL_SetLowThreshold ( TSI_Type * base, uint32_t low_threshold ) [inline], [static]`

Parameters

|                      |                          |
|----------------------|--------------------------|
| <i>base</i>          | TSI module base address. |
| <i>low_threshold</i> | Low counter threshold.   |

Returns

None.

**73.2.4.60** `static void TSI_HAL_SetHighThreshold ( TSI_Type * base, uint32_t high_threshold ) [inline], [static]`

## TSI HAL driver

### Parameters

|                       |                          |
|-----------------------|--------------------------|
| <i>base</i>           | TSI module base address. |
| <i>high_threshold</i> | High counter threshold.  |

### Returns

None.

**73.2.4.61** `static uint32_t TSI_HAL_GetEnableStop ( TSI_Type * base ) [inline], [static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

Number of scans.

**73.2.4.62** `static void TSI_HAL_EnableHardwareTriggerScan ( TSI_Type * base ) [inline], [static]`

### Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

### Returns

None.

**73.2.4.63** `static void TSI_HAL_CurrentSourcePairSwapped ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.64** `static void TSI_HAL_CurrentSourcePairNotSwapped ( TSI_Type * base )  
[inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.65** `static uint32_t TSI_HAL_GetCurrentSourcePairSwapped ( TSI_Type * base )  
[inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Current source pair swapped status.

**73.2.4.66** `static void TSI_HAL_SetMeasuredChannelNumber ( TSI_Type * base, uint32_t  
channel ) [inline], [static]`

Parameters

---

## TSI HAL driver

|                |                          |
|----------------|--------------------------|
| <i>base</i>    | TSI module base address. |
| <i>channel</i> | Channel number 0 ... 15. |

Returns

None.

**73.2.4.67** `static uint32_t TSI_HAL_GetMeasuredChannelNumber ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

uint32\_t Channel number 0 ... 15.

**73.2.4.68** `static void TSI_HAL_DmaTransferEnable ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.69** `static void TSI_HAL_DmaTransferDisable ( TSI_Type * base ) [inline], [static]`

Parameters

---

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

None.

**73.2.4.70** `static uint32_t TSI_HAL_IsDmaTransferEnable ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

State of enable module flag.

**73.2.4.71** `static uint32_t TSI_HAL_GetCounter ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

Accumulated scan counter value ticked by the reference clock.

**73.2.4.72** `static void TSI_HAL_SetMode ( TSI_Type * base, tsi_analog_mode_select_t mode ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

## TSI HAL driver

|             |             |
|-------------|-------------|
| <i>mode</i> | Mode value. |
|-------------|-------------|

Returns

None.

**73.2.4.73** `static tsi_analog_mode_select_t TSI_HAL_GetMode ( TSI_Type * base )`  
**[inline], [static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

`tsi_analog_mode_select_t` Mode value.

**73.2.4.74** `static uint32_t TSI_HAL_GetNoiseResult ( TSI_Type * base )` **[inline],**  
**[static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

`tsi_analog_mode_select_t` Mode value.

**73.2.4.75** `static void TSI_HAL_SetOscillatorVoltageRails ( TSI_Type * base,`  
`tsi_oscillator_voltage_rails_t dvolt )` **[inline], [static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

|              |                    |
|--------------|--------------------|
| <i>dvolt</i> | The voltage rails. |
|--------------|--------------------|

Returns

None.

**73.2.4.76** `static tsi_oscilator_voltage_rails_t TSI_HAL_GetOscilatorVoltageRails ( TSI_Type * base ) [inline], [static]`

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | TSI module base address. |
|-------------|--------------------------|

Returns

*dvolt* The voltage rails..

## TSI Peripheral Driver

### 73.3 TSI Peripheral Driver

#### 73.3.1 Overview

The section describes the programming interface of the TSI Peripheral driver

#### 73.3.2 Overview

The TSI peripheral driver measures the capacitance of electrodes (touch sensing) in various modes and provides API functions for input/output operations.

Figure 73.3.1: TSI Driver Block Diagram

#### 73.3.3 TSI Initialization

To initialize TSI, the application defines the startup configuration and handles to the initialization routine. Include the "fsl\_tsi\_driver.h" header file in source files to use TSI driver and operate touch sensing functionality.

This is an example of the TSI driver initialization (with example of configuration) and simple measurement:

```
#include "fsl_tsi_driver.h"

// Declaration of TSI callback function
static void tsi_irq_callback(uint32_t instance, void* usrData);

// Set up the HW configuration for normal mode of TSI
static const tsi_config_t tsi_HwConfig =
{
 .ps = kTsiElecOscPrescaler_2div,
```

#### Files

- file [fsl\\_tsi\\_driver.h](#)

#### Data Structures

- struct [tsi\\_user\\_config\\_t](#)

- *User configuration structure for TSI driver. [More...](#)*
- struct [tsi\\_operation\\_mode\\_t](#)  
*Driver operation mode data hold structure. [More...](#)*
- struct [tsi\\_state\\_t](#)  
*Driver data storage place. [More...](#)*

### Typedefs

- typedef void(\* [tsi\\_callback\\_t](#))(uint32\_t instance, void \*usrData)  
*Call back routine of TSI driver.*

### Enumerations

- enum [tsi\\_modes\\_t](#) {  
[tsi\\_OpModeNormal](#) = 0,  
[tsi\\_OpModeProximity](#),  
[tsi\\_OpModeLowPower](#),  
[tsi\\_OpModeNoise](#),  
[tsi\\_OpModeCnt](#),  
[tsi\\_OpModeNoChange](#) }  
*Driver operation mode definition.*

### Variables

- TSI\_Type \*const [g\\_tsiBase](#) []  
*Table of base addresses for TSI instances.*
- const IRQn\_Type [g\\_tsiIrqId](#) [TSI\_INSTANCE\_COUNT]  
*Table to save TSI IRQ enumeration numbers defined in CMSIS header file.*
- [tsi\\_state\\_t](#) \* [g\\_tsiStatePtr](#) [TSI\_INSTANCE\_COUNT]  
*Table to save pointers to context data.*

### Initialization

- [tsi\\_status\\_t](#) [TSI\\_DRV\\_Init](#) (uint32\_t instance, [tsi\\_state\\_t](#) \*tsiState, const [tsi\\_user\\_config\\_t](#) \*tsiUserConfig)  
*Initializes a TSI instance for operation.*
- [tsi\\_status\\_t](#) [TSI\\_DRV\\_DeInit](#) (uint32\_t instance)  
*Shuts down the TSI by disabling interrupts and the peripheral.*
- [tsi\\_status\\_t](#) [TSI\\_DRV\\_EnableElectrode](#) (uint32\_t instance, const uint32\_t channel, const bool enable)  
*Enables/disables one electrode of the TSI module.*
- uint32\_t [TSI\\_DRV\\_GetEnabledElectrodes](#) (uint32\_t instance)  
*Returns a mask of the enabled electrodes of the TSI module.*
- [tsi\\_status\\_t](#) [TSI\\_DRV\\_Measure](#) (uint32\_t instance)

## TSI Peripheral Driver

- Starts the measure cycle of the enabled electrodes.*

  - [tsi\\_status\\_t TSI\\_DRV\\_MeasureBlocking](#) (uint32\_t instance)

*Starts the measure cycle of the enabled electrodes in blocking mode.*
- [tsi\\_status\\_t TSI\\_DRV\\_AbortMeasure](#) (uint32\_t instance)

*Aborts the measure cycle in non standard use of the driver.*
- [tsi\\_status\\_t TSI\\_DRV\\_GetCounter](#) (uint32\_t instance, const uint32\_t channel, uint16\_t \*counter)

*Returns the last measured value.*
- [tsi\\_status\\_t TSI\\_DRV\\_GetStatus](#) (uint32\_t instance)

*Returns the current status of the driver.*
- [tsi\\_status\\_t TSI\\_DRV\\_EnableLowPower](#) (uint32\_t instance)

*Enters the low power mode of the TSI driver.*
- [tsi\\_status\\_t TSI\\_DRV\\_DisableLowPower](#) (uint32\_t instance, const [tsi\\_modes\\_t](#) mode)

*This function returns back the TSI driver from the low power to standard operation.*
- [tsi\\_status\\_t TSI\\_DRV\\_Recalibrate](#) (uint32\_t instance, uint32\_t \*lowestSignal)

*Automatically recalibrates all important TSI settings.*
- [tsi\\_status\\_t TSI\\_DRV\\_SetCallbackFunc](#) (uint32\_t instance, const [tsi\\_callback\\_t](#) pFuncCallBack, void \*usrData)

*Sets the callback function that is called when the measure cycle ends.*
- [tsi\\_status\\_t TSI\\_DRV\\_ChangeMode](#) (uint32\_t instance, const [tsi\\_modes\\_t](#) mode)

*Changes the current working operation mode.*
- [tsi\\_modes\\_t TSI\\_DRV\\_GetMode](#) (uint32\_t instance)

*Returns the current working operation mode.*
- [tsi\\_status\\_t TSI\\_DRV\\_LoadConfiguration](#) (uint32\_t instance, const [tsi\\_modes\\_t](#) mode, const [tsi\\_operation\\_mode\\_t](#) \*operationMode)

*Loads the new configuration into a specific mode.*
- [tsi\\_status\\_t TSI\\_DRV\\_SaveConfiguration](#) (uint32\_t instance, const [tsi\\_modes\\_t](#) mode, [tsi\\_operation\\_mode\\_t](#) \*operationMode)

*Saves the TSI driver configuration for a specific mode.*

### 73.3.4 Data Structure Documentation

#### 73.3.4.1 struct [tsi\\_user\\_config\\_t](#)

Use an instance of this structure with [TSI\\_DRV\\_Init\(\)](#). This allows you to configure the most common settings of the TSI peripheral with a single function call. Settings include:

#### Data Fields

- [tsi\\_config\\_t](#) \* config
- [tsi\\_callback\\_t](#) pCallBackFunc
- void \* usrData

#### 73.3.4.1.0.13 Field Documentation

##### 73.3.4.1.0.13.1 [tsi\\_config\\_t](#)\* [tsi\\_user\\_config\\_t::config](#)

A pointer to hardware configuration. Can't be NULL.

**73.3.4.1.0.13.2 tsi\_callback\_t tsi\_user\_config\_t::pCallbackFunc**

A pointer to call back function of end of measurement.

**73.3.4.1.0.13.3 void\* tsi\_user\_config\_t::usrData**

A user data of call back function.

**73.3.4.2 struct tsi\_operation\_mode\_t**

This is the operation mode data hold structure. The structure is keep all needed data to be driver able to switch the operation modes and properly set up HW peripheral.

**Data Fields**

- uint16\_t [enabledElectrodes](#)
- [tsi\\_config\\_t](#) [config](#)

**73.3.4.2.0.14 Field Documentation****73.3.4.2.0.14.1 uint16\_t tsi\_operation\_mode\_t::enabledElectrodes**

The back up of enabled electrodes for operation mode

**73.3.4.2.0.14.2 tsi\_config\_t tsi\_operation\_mode\_t::config**

A hardware configuration.

**73.3.4.3 struct tsi\_state\_t**

It must be created by the application code and the pointer is handled by the [TSI\\_DRV\\_Init](#) function to driver. The driver keeps all context data for itself run. Settings include:

**Data Fields**

- [tsi\\_status\\_t](#) [status](#)
- [tsi\\_callback\\_t](#) [pCallbackFunc](#)
- void \* [usrData](#)
- [semaphore\\_t](#) [irqSync](#)
- [mutex\\_t](#) [lock](#)
- [mutex\\_t](#) [lockChangeMode](#)
- bool [isBlockingMeasure](#)
- [tsi\\_modes\\_t](#) [opMode](#)
- [tsi\\_operation\\_mode\\_t](#) [opModesData](#) [[tsi\\_OpModeCnt](#)]
- uint16\_t [counters](#) [[FSL\\_FEATURE\\_TSI\\_CHANNEL\\_COUNT](#)]

## TSI Peripheral Driver

### 73.3.4.3.0.15 Field Documentation

#### 73.3.4.3.0.15.1 `tsi_status_t tsi_state_t::status`

Current status of the driver.

#### 73.3.4.3.0.15.2 `tsi_callback_t tsi_state_t::pCallbackFunc`

A pointer to call back function of end of measurement.

#### 73.3.4.3.0.15.3 `void* tsi_state_t::usrData`

A user data pointer handled by call back function.

#### 73.3.4.3.0.15.4 `semaphore_t tsi_state_t::irqSync`

Used to wait for ISR to complete its measure business.

#### 73.3.4.3.0.15.5 `mutex_t tsi_state_t::lock`

Used by whole driver to secure the context data integrity.

#### 73.3.4.3.0.15.6 `mutex_t tsi_state_t::lockChangeMode`

Used by change mode function to secure the context data integrity.

#### 73.3.4.3.0.15.7 `bool tsi_state_t::isBlockingMeasure`

Used to internal indication of type of measurement.

#### 73.3.4.3.0.15.8 `tsi_modes_t tsi_state_t::opMode`

Storage of current operation mode.

#### 73.3.4.3.0.15.9 `tsi_operation_mode_t tsi_state_t::opModesData[tsi_OpModeCnt]`

Data storage of individual operational modes.

#### 73.3.4.3.0.15.10 `uint16_t tsi_state_t::counters[FSL_FEATURE_TSI_CHANNEL_COUNT]`

The mirror of last state of counter registers

### 73.3.5 Typedef Documentation

#### 73.3.5.1 `typedef void(* tsi_callback_t)(uint32_t instance, void *usrData)`

The function is called on end of the measure of the TSI driver. The function can be called from interrupt, so the code inside the callback should be short and fast.

### Parameters

|                 |                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------|
| <i>instance</i> | - instance of the TSI peripheral                                                                              |
| <i>usrData</i>  | - user data (type is void*), the user data are specified by function <a href="#">TSI_DRV_SetCall-BackFunc</a> |

### Returns

- none

## 73.3.6 Enumeration Type Documentation

### 73.3.6.1 enum tsi\_modes\_t

The operation name definition used for TSI driver.

#### Enumerator

- tsi\_OpModeNormal* The normal mode of TSI.
- tsi\_OpModeProximity* The proximity sensing mode of TSI.
- tsi\_OpModeLowPower* The low power mode of TSI.
- tsi\_OpModeNoise* The noise mode of TSI. This mode is not valid with TSI HW, valid only for the TSIL HW.
- tsi\_OpModeCnt* Count of TSI modes - for internal use.
- tsi\_OpModeNoChange* The special value of operation mode that allows call for example [TSI\\_DRV\\_DisableLowPower](#) function without change of operation mode.

## 73.3.7 Function Documentation

### 73.3.7.1 tsi\_status\_t TSI\_DRV\_Init ( uint32\_t instance, tsi\_state\_t \* tsiState, const tsi\_user\_config\_t \* tsiUserConfig )

This function initializes the run-time state structure and prepares the entire peripheral to measure the capacitances on electrodes.

```
static tsi_state_t myTsiDriverStateStructure;

tsi_user_config_t myTsiDriveruserConfig =
{
 .config =
 {
 ...
 },
 .pCallBackFunc = APP_myTsiCallBackFunc,
 .usrData = myData,
};
```

## TSI Peripheral Driver

```
if(TSI_DRV_Init(0, &myTsiDriverStateStructure, &myTsiDriveruserConfig) != kStatus_TSI_Success)
{
 // Error, the TSI is not initialized
}
```

### Parameters

|                      |                                                                                                                                                                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>      | The TSI module instance.                                                                                                                                                                                                                                                                           |
| <i>tsiState</i>      | A pointer to the TSI driver state structure memory. The user is only responsible to pass in the memory for this run-time state structure where the TSI driver will take care of filling out the members. This run-time state structure keeps track of the current TSI peripheral and driver state. |
| <i>tsiUserConfig</i> | The user configuration structure of type <code>tsi_user_config_t</code> . The user populates the members of this structure and passes the pointer of this structure into the function.                                                                                                             |

### Returns

An error code or `kStatus_TSI_Success`.

### 73.3.7.2 `tsi_status_t TSI_DRV_DeInit ( uint32_t instance )`

This function disables the TSI interrupts and the peripheral.

```
if(TSI_DRV_DeInit(0) != kStatus_TSI_Success)
{
 // Error, the TSI is not de-initialized
}
```

### Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

### Returns

An error code or `kStatus_TSI_Success`.

### 73.3.7.3 `tsi_status_t TSI_DRV_EnableElectrode ( uint32_t instance, const uint32_t channel, const bool enable )`

Function must be called for each used electrodes after initialization of TSI driver.

```
// On the TSI instance 0, enable electrode with index 5
if(TSI_DRV_EnableElectrode(0, 5, TRUE) != kStatus_TSI_Success)
{
 // Error, the TSI 5'th electrode is not enabled
}
```

Parameters

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>instance</i> | The TSI module instance.                      |
| <i>channel</i>  | Index of TSI channel.                         |
| <i>enable</i>   | TRUE - for channel enable, FALSE for disable. |

Returns

An error code or `kStatus_TSI_Success`.

**73.3.7.4 uint32\_t TSI\_DRV\_GetEnabledElectrodes ( uint32\_t instance )**

The function returns the mask of the enabled electrodes of the current mode.

```
uint32_t enabledElectrodeMask;
enabledElectrodeMask = TSI_DRV_GetEnabledElectrodes(0);
```

Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

Returns

Mask of enabled electrodes for current mode.

**73.3.7.5 tsi\_status\_t TSI\_DRV\_Measure ( uint32\_t instance )**

The function is non blocking. Therefore, the results can be obtained after the driver completes the measure cycle. The end of the measure cycle can be checked by pooling the `TSI_DRV_GetStatus` function or wait for registered callback function by using the `TSI_DRV_SetCallBackFunc` or `TSI_DRV_Init`.

```
// Example of the pooling style of use of TSI_DRV_Measure() function
if(TSI_DRV_Measure(0) != kStatus_TSI_Success)
{
 // Error, the TSI 5'th electrode is not enabled
}

while(TSI_DRV_GetStatus(0) != kStatus_TSI_Initialized)
{
 // Do something useful - don't waste the CPU cycle time
}
```

## TSI Peripheral Driver

### Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

### Returns

An error code or kStatus\_TSI\_Success.

### 73.3.7.6 tsi\_status\_t TSI\_DRV\_MeasureBlocking ( uint32\_t instance )

This function is blocking. Therefore, after the function call, the result of measured electrodes is available and can be obtained by calling the [TSI\\_DRV\\_GetCounter](#) function.

```
// Example of the TSI_DRV_Measure() function pooling style
if(TSI_DRV_MeasureBlocking(0) != kStatus_TSI_Success)
{
 // Error, the TSI 5'th electrode is not enabled
}else
{
 // Get the result by TSI_DRV_GetCounter function
}
```

### Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

### Returns

An error code or kStatus\_TSI\_Success.

### 73.3.7.7 tsi\_status\_t TSI\_DRV\_AbortMeasure ( uint32\_t instance )

This function aborts the running measure cycle. It is designed for unexpected situations and not targeted for standard use.

```
// Start measure by @ref TSI_DRV_Measure() function
if(TSI_DRV_Measure(0) != kStatus_TSI_Success)
{
 // Error, the TSI 5'th electrode is not enabled
}

if(isNeededAbort) // I need abort measure from any application reason
{
 TSI_DRV_AbortMeasure(0);
}
```

### Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

### Returns

An error code or `kStatus_TSI_Success`.

#### 73.3.7.8 `tsi_status_t TSI_DRV_GetCounter ( uint32_t instance, const uint32_t channel, uint16_t * counter )`

This function returns the last measured value in the previous measure cycle. The data is buffered inside the driver.

```
// Get the counter value from TSI instance 0 and 5th channel
uint32_t result;
if(TSI_DRV_GetCounter(0, 5, &result) != kStatus_TSI_Success)
{
 // Error, the TSI 5'th electrode is not read
}
```

### Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The TSI module instance.                                                |
| <i>channel</i>  | The TSI electrode index.                                                |
| <i>counter</i>  | The pointer to 16 bit value where will be stored channel counter value. |

### Returns

An error code or `kStatus_TSI_Success`.

#### 73.3.7.9 `tsi_status_t TSI_DRV_GetStatus ( uint32_t instance )`

This function returns the current working status of the driver.

```
// Get the current status of TSI driver
tsi_status_t status;
status = TSI_DRV_GetStatus(0);
```

## TSI Peripheral Driver

### Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

### Returns

An current status of the driver.

#### 73.3.7.10 `tsi_status_t TSI_DRV_EnableLowPower ( uint32_t instance )`

This function switches the driver to low power mode and immediately enables the low power functionality of the TSI peripheral. Before calling this function, the low power mode must be configured - Enable the right electrode and recalibrate the low power mode to get the best performance for this mode.

```
// Switch the driver to the low power mode
uint16_t signal;

// The first time is needed to configure the low power mode configuration

(void)TSI_DRV_ChangeMode(0, tsi_OpModeLowPower); // I don't check the
 result because I believe in.
// Enable the right one electrode for low power AKE up operation
(void)TSI_DRV_EnableElectrode(0, 5, true);
// Recalibrate the mode to get the best performance for this one electrode
(void)TSI_DRV_Recalibrate(0, &signal);

if(TSI_DRV_EnableLowPower(0) != kStatus_TSI_Success)
{
 // Error, the TSI driver can't go to low power mode
}
```

### Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

### Returns

An error code or `kStatus_TSI_Success`.

#### 73.3.7.11 `tsi_status_t TSI_DRV_DisableLowPower ( uint32_t instance, const tsi_modes_t mode )`

Function switch the driver back form low power mode and it can immediately change the operation mode to any other or keep the driver in low power configuration, to be able go back to low power state.

```
// Switch the driver from the low power mode

if(TSI_DRV_DisableLowPower(0, tsi_OpModeNormal) !=
 kStatus_TSI_Success)
{
 // Error, the TSI driver can't go from low power mode
}
```

Parameters

|                 |                                |
|-----------------|--------------------------------|
| <i>instance</i> | The TSI module instance.       |
| <i>mode</i>     | The new operation mode request |

Returns

An error code or kStatus\_TSI\_Success.

**73.3.7.12 tsi\_status\_t TSI\_DRV\_Recalibrate ( uint32\_t instance, uint32\_t \* lowestSignal )**

This function forces the driver to start the recalibration procedure for the current operation mode to get the best possible TSI hardware settings. The computed setting is stored into the operation mode data and can be loaded and saved by the [TSI\\_DRV\\_LoadConfiguration](#) or the [TSI\\_DRV\\_SaveConfiguration](#) functions.

Warning

The function could take more time to return and is blocking.

```
// Recalibrate current mode
uint16_t signal;

// Recalibrate the mode to get the best performance for this one electrode

if(TSI_DRV_Recalibrate(0, &signal) != kStatus_TSI_Success)
{
 // Error, the TSI driver can't recalibrate this mode
}
```

Parameters

|                     |                                                                                 |
|---------------------|---------------------------------------------------------------------------------|
| <i>instance</i>     | The TSI module instance.                                                        |
| <i>lowestSignal</i> | The pointer to variable where will be store the lowest signal of all electrodes |

Returns

An error code or kStatus\_TSI\_Success.

**73.3.7.13 tsi\_status\_t TSI\_DRV\_SetCallbackFunc ( uint32\_t instance, const tsi\_callback\_t pFuncCallback, void \* usrData )**

This function sets up or clears, (parameter pFuncCallback = NULL), the callback function pointer which is called after each measure cycle ends. The user can also set the custom user data, that is handled by the parameter to a call back function. One function can be called by more sources.

## TSI Peripheral Driver

```
// Clear previous call back function

if(TSI_DRV_SetCallBackFunc(0, NULL, NULL) != kStatus_TSI_Success)
{
 // Error, the TSI driver can't set up the call back function at the moment
}

// Set new call back function

if(TSI_DRV_SetCallBackFunc(0, myFunction, (void*)0x12345678) != kStatus_TSI_Success)
{
 // Error, the TSI driver can't set up the call back function at the moment
}
```

### Parameters

|                      |                                               |
|----------------------|-----------------------------------------------|
| <i>instance</i>      | The TSI module instance.                      |
| <i>pFuncCallBack</i> | The pointer to application call back function |
| <i>usrData</i>       | The user data pointer                         |

### Returns

An error code or kStatus\_TSI\_Success.

### 73.3.7.14 tsi\_status\_t TSI\_DRV\_ChangeMode ( uint32\_t *instance*, const tsi\_modes\_t *mode* )

This function changes the working operation mode of the driver.

```
// Change operation mode to low power

if(TSI_DRV_ChangeMode(0, tsi_OpModeLowPower) != kStatus_TSI_Success)
{
 // Error, the TSI driver can't change the operation mode into low power
}
```

### Parameters

|                 |                                  |
|-----------------|----------------------------------|
| <i>instance</i> | The TSI module instance.         |
| <i>mode</i>     | The requested new operation mode |

### Returns

An error code or kStatus\_TSI\_Success.

**73.3.7.15 tsi\_modes\_t TSI\_DRV\_GetMode ( uint32\_t instance )**

This function returns the current working operation mode of the driver.

```
// Gets current operation mode of TSI driver
tsi_modes_t mode;

mode = TSI_DRV_GetMode(0);
```

Parameters

|                 |                          |
|-----------------|--------------------------|
| <i>instance</i> | The TSI module instance. |
|-----------------|--------------------------|

Returns

An current operation mode of TSI driver.

**73.3.7.16 tsi\_status\_t TSI\_DRV\_LoadConfiguration ( uint32\_t instance, const tsi\_modes\_t mode, const tsi\_operation\_mode\_t \* operationMode )**

This function loads the new configuration into a specific mode. This can be used when the calibrated data are stored in any NVM to load after startup of the MCU to avoid run recalibration that takes more time.

```
// Load operation mode configuration

extern const tsi_operation_mode_t * myTsiNvmLowPowerConfiguration;

if(TSI_DRV_LoadConfiguration(0, tsi_OpModeLowPower,
 myTsiNvmLowPowerConfiguration) != kStatus_TSI_Success)
{
 // Error, the TSI driver can't load the configuration
}
```

Parameters

|                      |                                                                         |
|----------------------|-------------------------------------------------------------------------|
| <i>instance</i>      | The TSI module instance.                                                |
| <i>mode</i>          | The requested new operation mode                                        |
| <i>operationMode</i> | The pointer to storage place of the configuration that should be loaded |

Returns

An error code or kStatus\_TSI\_Success.

## TSI Peripheral Driver

### 73.3.7.17 `tsi_status_t TSI_DRV_SaveConfiguration ( uint32_t instance, const tsi_modes_t mode, tsi_operation_mode_t * operationMode )`

This function saves the configuration of a specific mode. This can be used when the calibrated data should be stored in any backup memory to load after the start of the MCU to avoid running the recalibration that takes more time.

```
// Save operation mode configuration
extern tsi_operation_mode_t myTsiNvmLowPowerConfiguration;
if(TSI_DRV_SaveConfiguration(0, tsi_OpModeLowPower, &
 myTsiNvmLowPowerConfiguration) != kStatus_TSI_Success)
{
 // Error, the TSI driver can't save the configuration
}
```

#### Parameters

|                      |                                                                       |
|----------------------|-----------------------------------------------------------------------|
| <i>instance</i>      | The TSI module instance.                                              |
| <i>mode</i>          | The requested new operation mode                                      |
| <i>operationMode</i> | The pointer to storage place of the configuration that should be save |

#### Returns

An error code or `kStatus_TSI_Success`.

## Chapter 74

# Universal Asynchronous Receiver/Transmitter (UART)

### 74.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Universal Asynchronous Receiver/-Transmitter (UART) block of Kinetis devices.

#### Modules

- [UART HAL driver](#)
- [UART Peripheral driver](#)

## Overview

### 74.2 UART HAL driver

### 74.3 Overview

This chapter describes the programming interface of the UART-ISO7816 HAL driver.

#### Files

- file `fsl_uart_hal.h`

#### Enumerations

- enum `uart_status_t`  
*Error codes for the UART driver.*
- enum `uart_stop_bit_count_t` {  
  `kUartOneStopBit` = 0U,  
  `kUartTwoStopBit` = 1U }  
*UART number of stop bits.*
- enum `uart_parity_mode_t` {  
  `kUartParityDisabled` = 0x0U,  
  `kUartParityEven` = 0x2U,  
  `kUartParityOdd` = 0x3U }  
*UART parity mode.*
- enum `uart_bit_count_per_char_t` {  
  `kUart8BitsPerChar` = 0U,  
  `kUart9BitsPerChar` = 1U }  
*UART number of bits in a character.*
- enum `uart_operation_config_t` {  
  `kUartOperates` = 0U,  
  `kUartStops` = 1U }  
*UART operation configuration constants.*
- enum `uart_receiver_source_t` {  
  `kUartLoopBack` = 0U,  
  `kUartSingleWire` = 1U }  
*UART receiver source select mode.*
- enum `uart_wakeup_method_t` {  
  `kUartIdleLineWake` = 0U,  
  `kUartAddrMarkWake` = 1U }  
*UART wakeup from standby method constants.*
- enum `uart_idle_line_select_t` {  
  `kUartIdleLineAfterStartBit` = 0U,  
  `kUartIdleLineAfterStopBit` = 1U }  
*UART idle-line detect selection types.*
- enum `uart_break_char_length_t` {  
  `kUartBreakChar10BitMinimum` = 0U,  
  `kUartBreakChar13BitMinimum` = 1U }  
*UART break character length settings for transmit/detect.*
- enum `uart_singlewire_txdir_t` {  
  `kUartSinglewireTxdirIn` = 0U,  
  `kUartSinglewireTxdirOut` = 1U }

- UART single-wire mode transmit direction.*

- void [UART\\_HAL\\_Init](#) (UART\_Type \*base)  
*Initializes the UART controller.*
- static void [UART\\_HAL\\_EnableTransmitter](#) (UART\_Type \*base)  
*Enables the UART transmitter.*
- static void [UART\\_HAL\\_DisableTransmitter](#) (UART\_Type \*base)  
*Disables the UART transmitter.*
- static bool [UART\\_HAL\\_IsTransmitterEnabled](#) (UART\_Type \*base)  
*Gets the UART transmitter enabled/disabled configuration setting.*
- static void [UART\\_HAL\\_EnableReceiver](#) (UART\_Type \*base)  
*Enables the UART receiver.*
- static void [UART\\_HAL\\_DisableReceiver](#) (UART\_Type \*base)  
*Disables the UART receiver.*
- static bool [UART\\_HAL\\_IsReceiverEnabled](#) (UART\_Type \*base)  
*Gets the UART receiver enabled/disabled configuration setting.*
- [uart\\_status\\_t](#) [UART\\_HAL\\_SetBaudRate](#) (UART\_Type \*base, uint32\_t sourceClockInHz, uint32\_t baudRate)  
*Configures the UART baud rate.*
- void [UART\\_HAL\\_SetBaudRateDivisor](#) (UART\_Type \*base, uint16\_t baudRateDivisor)  
*Sets the UART baud rate modulo divisor value.*
- static void [UART\\_HAL\\_SetBitCountPerChar](#) (UART\_Type \*base, [uart\\_bit\\_count\\_per\\_char\\_t](#) bitCountPerChar)  
*Configures the number of bits per character in the UART controller.*
- void [UART\\_HAL\\_SetParityMode](#) (UART\_Type \*base, [uart\\_parity\\_mode\\_t](#) parityMode)  
*Configures the parity mode in the UART controller.*
- static uint32\_t [UART\\_HAL\\_GetDataRegAddr](#) (UART\_Type \*base)  
*Get UART transmit/receive data register address.*

## UART Interrupts and DMA

- void [UART\\_HAL\\_SetIntMode](#) (UART\_Type \*base, [uart\\_interrupt\\_t](#) interrupt, bool enable)  
*Configures the UART module interrupts to enable/disable various interrupt sources.*
- bool [UART\\_HAL\\_GetIntMode](#) (UART\_Type \*base, [uart\\_interrupt\\_t](#) interrupt)  
*Returns whether the UART module interrupts is enabled/disabled.*

## UART Transfer Functions

- void [UART\\_HAL\\_Putchar](#) (UART\_Type \*base, uint8\_t data)

- *This function allows the user to send an 8-bit character from the UART data register.*
- void [UART\\_HAL\\_Putchar9](#) (UART\_Type \*base, uint16\_t data)
- *This function allows the user to send a 9-bit character from the UART data register.*
- void [UART\\_HAL\\_Getchar](#) (UART\_Type \*base, uint8\_t \*readData)
- *This function gets a received 8-bit character from the UART data register.*
- void [UART\\_HAL\\_Getchar9](#) (UART\_Type \*base, uint16\_t \*readData)
- *This function gets a received 9-bit character from the UART data register.*
- void [UART\\_HAL\\_SendDataPolling](#) (UART\_Type \*base, const uint8\_t \*txBuff, uint32\_t txSize)
- *Sends out multiple bytes of data using polling method.*
- [uart\\_status\\_t](#) [UART\\_HAL\\_ReceiveDataPolling](#) (UART\_Type \*base, uint8\_t \*rxBuff, uint32\_t rxSize)
- *Receives multiple bytes of data using polling method.*

## UART Status Flags

- bool [UART\\_HAL\\_GetStatusFlag](#) (UART\_Type \*base, [uart\\_status\\_flag\\_t](#) statusFlag)
- *Gets all UART status flag states.*
- [uart\\_status\\_t](#) [UART\\_HAL\\_ClearStatusFlag](#) (UART\_Type \*base, [uart\\_status\\_flag\\_t](#) statusFlag)
- *Clears an individual and specific UART status flag.*

## UART Special Feature Configurations

- static void [UART\\_HAL\\_SetLoopCmd](#) (UART\_Type \*base, bool enable)
- *Configures the UART loopback operation.*
- static void [UART\\_HAL\\_SetReceiverSource](#) (UART\_Type \*base, [uart\\_receiver\\_source\\_t](#) source)
- *Configures the UART single-wire operation.*
- static void [UART\\_HAL\\_SetTransmitterDir](#) (UART\_Type \*base, [uart\\_singlewire\\_txdirection\\_t](#) direction)
- *Configures the UART transmit direction while in single-wire mode.*
- [uart\\_status\\_t](#) [UART\\_HAL\\_PutReceiverInStandbyMode](#) (UART\_Type \*base)
- *Places the UART receiver in standby mode.*
- static void [UART\\_HAL\\_PutReceiverInNormalMode](#) (UART\_Type \*base)
- *Places the UART receiver in normal mode (disable standby mode operation).*
- static bool [UART\\_HAL\\_IsReceiverInStandby](#) (UART\_Type \*base)
- *Determines if the UART receiver is currently in standby mode.*
- static void [UART\\_HAL\\_SetReceiverWakeupMethod](#) (UART\_Type \*base, [uart\\_wakeup\\_method\\_t](#) method)
- *Selects the UART receiver wakeup method (idle-line or address-mark) from standby mode.*
- static [uart\\_wakeup\\_method\\_t](#) [UART\\_HAL\\_GetReceiverWakeupMethod](#) (UART\_Type \*base)
- *Gets the UART receiver wakeup method (idle-line or address-mark) from standby mode.*
- void [UART\\_HAL\\_ConfigIdleLineDetect](#) (UART\_Type \*base, uint8\_t idleLine, uint8\_t rxWakeIdleDetect)
- *Configures the operation options of the UART idle line detect.*
- static void [UART\\_HAL\\_SetBreakCharTransmitLength](#) (UART\_Type \*base, [uart\\_break\\_char\\_length\\_t](#) length)
- *Configures the UART break character transmit length.*
- static void [UART\\_HAL\\_SetBreakCharCmd](#) (UART\_Type \*base, bool enable)
- *Configures the UART transmit send break character operation.*
- void [UART\\_HAL\\_SetMatchAddress](#) (UART\_Type \*base, bool matchAddrMode1, bool matchAddrMode2, uint8\_t matchAddrValue1, uint8\_t matchAddrValue2)
- *Configures the UART match address mode control operation.*

## Enumeration Type Documentation

### 74.4 Enumeration Type Documentation

#### 74.4.1 enum uart\_status\_t

#### 74.4.2 enum uart\_stop\_bit\_count\_t

These constants define the number of allowable stop bits to configure in a UART base.

Enumerator

*kUartOneStopBit* one stop bit  
*kUartTwoStopBit* two stop bits

#### 74.4.3 enum uart\_parity\_mode\_t

These constants define the UART parity mode options: disabled or enabled of type even or odd.

Enumerator

*kUartParityDisabled* parity disabled  
*kUartParityEven* parity enabled, type even, bit setting: PE|PT = 10  
*kUartParityOdd* parity enabled, type odd, bit setting: PE|PT = 11

#### 74.4.4 enum uart\_bit\_count\_per\_char\_t

These constants define the number of allowable data bits per UART character. Note, check the UART documentation to determine if the desired UART base supports the desired number of data bits per UART character.

Enumerator

*kUart8BitsPerChar* 8-bit data characters  
*kUart9BitsPerChar* 9-bit data characters

#### 74.4.5 enum uart\_operation\_config\_t

This provides constants for UART operational states: "operates normally" or "stops/ceases operation"

Enumerator

*kUartOperates* UART continues to operate normally.  
*kUartStops* UART ceases operation.

#### 74.4.6 enum uart\_receiver\_source\_t

Enumerator

*kUartLoopBack* Internal loop back mode.

*kUartSingleWire* Single wire mode.

#### 74.4.7 enum uart\_wakeup\_method\_t

This provides constants for the two UART wakeup methods: idle-line or address-mark.

Enumerator

*kUartIdleLineWake* The idle-line wakes UART receiver from standby.

*kUartAddrMarkWake* The address-mark wakes UART receiver from standby.

#### 74.4.8 enum uart\_idle\_line\_select\_t

This provides constants for the UART idle character bit-count start: either after start or stop bit.

Enumerator

*kUartIdleLineAfterStartBit* UART idle character bit count start after start bit.

*kUartIdleLineAfterStopBit* UART idle character bit count start after stop bit.

#### 74.4.9 enum uart\_break\_char\_length\_t

This provides constants for the UART break character length for both transmission and detection purposes. Note that the actual maximum bit times may vary depending on the UART base.

Enumerator

*kUartBreakChar10BitMinimum* UART break char length 10 bit times (if M = 0, SBNS = 0) or 11 (if M = 1, SBNS = 0 or M = 0, SBNS = 1) or 12 (if M = 1, SBNS = 1 or M10 = 1, SNBS = 0) or 13 (if M10 = 1, SNBS = 1)

*kUartBreakChar13BitMinimum* UART break char length 13 bit times (if M = 0, SBNS = 0) or 14 (if M = 1, SBNS = 0 or M = 0, SBNS = 1) or 15 (if M = 1, SBNS = 1 or M10 = 1, SNBS = 0) or 16 (if M10 = 1, SNBS = 1)

## Enumeration Type Documentation

### 74.4.10 enum uart\_singlewire\_txdir\_t

This provides constants for the UART transmit direction when configured for single-wire mode. The transmit line TXDIR is either an input or output.

Enumerator

*kUartSinglewireTxdirIn* UART Single-Wire mode TXDIR input.

*kUartSinglewireTxdirOut* UART Single-Wire mode TXDIR output.

### 74.4.11 enum uart\_ir\_tx\_pulsewidth\_t

This provides constants for the UART infrared (IR) pulse widths. Options include 3/16, 1/16, 1/32, and 1/4 pulse widths.

Enumerator

*kUartIrThreeSixteenthsWidth* 3/16 pulse

*kUartIrOneSixteenthWidth* 1/16 pulse

*kUartIrOneThirtysecondsWidth* 1/32 pulse

*kUartIrOneFourthWidth* 1/4 pulse

### 74.4.12 enum uart\_iso7816\_transfer\_protocoltype\_t

This provides constants for the UART ISO7816 transport protocol types.

Enumerator

*kUartIso7816TransfertType0* Transfer type 0.

*kUartIso7816TransfertType1* Transfer type 1.

### 74.4.13 enum uart\_iso7816\_onack\_config\_t

This provides constants for the UART ISO7816 module ONACK generation.

Enumerator

*kUartIso7816OnackEnable* Enable ONACK generation.

*kUartIso7816OnackDisable* Disable ONACK generation.

#### 74.4.14 enum uart\_iso7816\_anack\_config\_t

This provides constants for the UART ISO7816 module ANACK generation.

Enumerator

*kUartIso7816AnackDisable* Disable ANACK generation.

*kUartIso7816AnackEnable* Enable ANACK generation.

#### 74.4.15 enum uart\_iso7816\_initd\_config\_t

This provides constants for the UART ISO7816 module Initial generation.

Enumerator

*kUartIso7816InitdDisable* Disable Initial Character detection.

*kUartIso7816InitdEnable* Enable Initial Character detection.

#### 74.4.16 enum uart\_status\_flag\_t

This provides constants for the UART status flags for use in the UART functions.

Enumerator

*kUartTxDataRegEmpty* Transmit data register empty flag, sets when transmit buffer is empty.

*kUartTxComplete* Transmission complete flag, sets when transmission activity complete.

*kUartRxDataRegFull* Receive data register full flag, sets when the receive data buffer is full.

*kUartIdleLineDetect* Idle line detect flag, sets when idle line detected.

*kUartRxOverrun* Receive Overrun, sets when new data is received before data is read from receive register.

*kUartNoiseDetect* Receive takes 3 samples of each received bit. If any of these samples differ, noise flag sets

*kUartFrameErr* Frame error flag, sets if logic 0 was detected where stop bit expected.

*kUartParityErr* If parity enabled, sets upon parity error detection.

*kUartRxActiveEdgeDetect* Receive pin active edge interrupt flag, sets when active edge detected.

*kUartRxActive* Receiver Active Flag (RAF), sets at beginning of valid start bit.

#### 74.4.17 enum uart\_interrupt\_t

This structure contains the settings for all of the UART interrupt configurations.

## Function Documentation

### Enumerator

*kUartIntRxActiveEdge* Receive Active Edge.  
*kUartIntTxDataRegEmpty* Transmit data register empty.  
*kUartIntTxComplete* Transmission complete.  
*kUartIntRxDataRegFull* Receiver data register full.  
*kUartIntIdleLine* Idle line.  
*kUartIntRxOverrun* Receiver Overrun.  
*kUartIntNoiseErrFlag* Noise error flag.  
*kUartIntFrameErrFlag* Framing error flag.  
*kUartIntParityErrFlag* Parity error flag.

### 74.4.18 enum uart\_iso7816\_interrupt\_t

This enumeration contains the settings for all of the UART ISO7816 feature-specific interrupt configurations.

### Enumerator

*kUartIntIso7816RxThreasholdExceeded* Receive Threshold Exceeded.  
*kUartIntIso7816TxThresholdExceeded* TransmitThresholdExceeded.  
*kUartIntIso7816GuardTimerViolated* Guard Timer Violated.  
*kUartIntIso7816AtrDurationTimer* ATR Duration Timer.  
*kUartIntIso7816InitialCharDetected* Initial Character Detected.  
*kUartIntIso7816BlockWaitTimer* Block Wait Timer.  
*kUartIntIso7816CharWaitTimer* Character Wait Timer.  
*kUartIntIso7816WaitTimer* Wait Timer.

## 74.5 Function Documentation

### 74.5.1 void UART\_HAL\_Init ( UART\_Type \* base )

This function initializes the module to a known state.

#### Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

### 74.5.2 static void UART\_HAL\_EnableTransmitter ( UART\_Type \* base ) [inline], [static]

This function allows the user to enable the UART transmitter.

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

**74.5.3 static void UART\_HAL\_DisableTransmitter ( UART\_Type \* *base* )  
[inline], [static]**

This function allows the user to disable the UART transmitter.

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

**74.5.4 static bool UART\_HAL\_IsTransmitterEnabled ( UART\_Type \* *base* )  
[inline], [static]**

This function allows the user to get the setting of the UART transmitter.

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

Returns

The state of UART transmitter enable(true)/disable(false) setting.

**74.5.5 static void UART\_HAL\_EnableReceiver ( UART\_Type \* *base* ) [inline],  
[static]**

This function allows the user to enable the UART receiver.

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

**74.5.6 static void UART\_HAL\_DisableReceiver ( UART\_Type \* *base* ) [inline],  
[static]**

This function allows the user to disable the UART receiver.

## Function Documentation

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

### 74.5.7 `static bool UART_HAL_IsReceiverEnabled ( UART_Type * base )` `[inline], [static]`

This function allows the user to get the setting of the UART receiver.

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

Returns

The state of UART receiver enable(true)/disable(false) setting.

### 74.5.8 `uart_status_t UART_HAL_SetBaudRate ( UART_Type * base, uint32_t` `sourceClockInHz, uint32_t baudRate )`

This function programs the UART baud rate to the desired value passed in by the user. The user must also pass in the module source clock so that the function can calculate the baud rate divisors to their appropriate values. In some UART bases it is required that the transmitter/receiver be disabled before calling this function. Generally this is applied to all UARTs to ensure safe operation.

Parameters

|                        |                                |
|------------------------|--------------------------------|
| <i>base</i>            | UART module base pointer.      |
| <i>sourceClockInHz</i> | UART source input clock in Hz. |
| <i>baudRate</i>        | UART desired baud rate.        |

Returns

An error code or `kStatus_UART_Success`

### 74.5.9 `void UART_HAL_SetBaudRateDivisor ( UART_Type * base, uint16_t` `baudRateDivisor )`

This function allows the user to program the baud rate divisor directly in situations where the divisor value is known. In this case, the user may not want to call the [UART\\_HAL\\_SetBaudRate\(\)](#) function, because

the divisor is already known.

## Function Documentation

Parameters

|                         |                                            |
|-------------------------|--------------------------------------------|
| <i>base</i>             | UART module base pointer.                  |
| <i>baudRate-Divisor</i> | The baud rate modulo division "SBR" value. |

**74.5.10 static void UART\_HAL\_SetBitCountPerChar ( UART\_Type \* *base*,  
uart\_bit\_count\_per\_char\_t *bitCountPerChar* ) [inline], [static]**

This function allows the user to configure the number of bits per character according to the typedef `uart_bit_count_per_char_t`.

Parameters

|                         |                                                                    |
|-------------------------|--------------------------------------------------------------------|
| <i>base</i>             | UART module base pointer.                                          |
| <i>bitCountPer-Char</i> | Number of bits per char (8, 9, or 10, depending on the UART base). |

**74.5.11 void UART\_HAL\_SetParityMode ( UART\_Type \* *base*, uart\_parity\_mode\_t  
*parityMode* )**

This function allows the user to configure the parity mode of the UART controller to disable it or enable it for even parity or for odd parity.

Parameters

|                   |                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------|
| <i>base</i>       | UART module base pointer.                                                                  |
| <i>parityMode</i> | Parity mode setting (enabled, disable, odd, even - see <code>parity_mode_t</code> struct). |

**74.5.12 static uint32\_t UART\_HAL\_GetDataRegAddr ( UART\_Type \* *base* )  
[inline], [static]**

Parameters

---

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

Returns

UART transmit/receive data register address.

**74.5.13 void UART\_HAL\_SetIntMode ( UART\_Type \* *base*, uart\_interrupt\_t *interrupt*, bool *enable* )**

Parameters

|                  |                                    |
|------------------|------------------------------------|
| <i>base</i>      | UART module base pointer.          |
| <i>interrupt</i> | UART interrupt configuration data. |
| <i>enable</i>    | true: enable, false: disable.      |

**74.5.14 bool UART\_HAL\_GetIntMode ( UART\_Type \* *base*, uart\_interrupt\_t *interrupt* )**

Parameters

|                  |                                    |
|------------------|------------------------------------|
| <i>base</i>      | UART module base pointer.          |
| <i>interrupt</i> | UART interrupt configuration data. |

Returns

true: enable, false: disable.

**74.5.15 void UART\_HAL\_Putchar ( UART\_Type \* *base*, uint8\_t *data* )**

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

## Function Documentation

|             |                                 |
|-------------|---------------------------------|
| <i>data</i> | The data to send of size 8-bit. |
|-------------|---------------------------------|

### 74.5.16 void UART\_HAL\_Putchar9 ( UART\_Type \* *base*, uint16\_t *data* )

Parameters

|             |                                 |
|-------------|---------------------------------|
| <i>base</i> | UART module base pointer.       |
| <i>data</i> | The data to send of size 9-bit. |

### 74.5.17 void UART\_HAL\_Getchar ( UART\_Type \* *base*, uint8\_t \* *readData* )

Parameters

|                 |                                                          |
|-----------------|----------------------------------------------------------|
| <i>base</i>     | UART module base pointer.                                |
| <i>readData</i> | The received data read from data register of size 8-bit. |

### 74.5.18 void UART\_HAL\_Getchar9 ( UART\_Type \* *base*, uint16\_t \* *readData* )

Parameters

|                 |                                                          |
|-----------------|----------------------------------------------------------|
| <i>base</i>     | UART module base pointer.                                |
| <i>readData</i> | The received data read from data register of size 9-bit. |

### 74.5.19 void UART\_HAL\_SendDataPolling ( UART\_Type \* *base*, const uint8\_t \* *txBuff*, uint32\_t *txSize* )

This function only supports 8-bit transaction.

Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

|               |                                                     |
|---------------|-----------------------------------------------------|
| <i>txBuff</i> | The buffer pointer which saves the data to be sent. |
| <i>txSize</i> | Size of data to be sent in unit of byte.            |

#### 74.5.20 **uart\_status\_t UART\_HAL\_ReceiveDataPolling ( UART\_Type \* *base*, uint8\_t \* *rxBuff*, uint32\_t *rxSize* )**

This function only supports 8-bit transaction.

Parameters

|               |                                                         |
|---------------|---------------------------------------------------------|
| <i>base</i>   | UART module base pointer.                               |
| <i>rxBuff</i> | The buffer pointer which saves the data to be received. |
| <i>rxSize</i> | Size of data need to be received in unit of byte.       |

Returns

Whether the transaction is success or rx overrun.

#### 74.5.21 **bool UART\_HAL\_GetStatusFlag ( UART\_Type \* *base*, uart\_status\_flag\_t *statusFlag* )**

Parameters

|                   |                           |
|-------------------|---------------------------|
| <i>base</i>       | UART module base pointer. |
| <i>statusFlag</i> | Status flag name.         |

Returns

Whether the current status flag is set(true) or not(false).

#### 74.5.22 **uart\_status\_t UART\_HAL\_ClearStatusFlag ( UART\_Type \* *base*, uart\_status\_flag\_t *statusFlag* )**

This function allows the user to clear an individual and specific UART status flag. Refer to structure definition `uart_status_flag_t` for list of status bits.

## Function Documentation

### Parameters

|                   |                                        |
|-------------------|----------------------------------------|
| <i>base</i>       | UART module base pointer.              |
| <i>statusFlag</i> | The desired UART status flag to clear. |

### Returns

An error code or kStatus\_UART\_Success.

**74.5.23 static void UART\_HAL\_SetLoopCmd ( UART\_Type \* *base*, bool *enable* ) [inline], [static]**

This function enables or disables the UART loopback operation.

### Parameters

|               |                                                                                  |
|---------------|----------------------------------------------------------------------------------|
| <i>base</i>   | UART module base pointer.                                                        |
| <i>enable</i> | The UART loopback mode configuration, either disabled (false) or enabled (true). |

**74.5.24 static void UART\_HAL\_SetReceiverSource ( UART\_Type \* *base*, uart\_receiver\_source\_t *source* ) [inline], [static]**

This function enables or disables the UART single-wire operation. In some UART bases it is required that the transmitter/receiver be disabled before calling this function. This may be applied to all UARTs to ensure safe operation.

### Parameters

|               |                                          |
|---------------|------------------------------------------|
| <i>base</i>   | UART module base pointer.                |
| <i>source</i> | The UART single-wire mode configuration. |

**74.5.25 static void UART\_HAL\_SetTransmitterDir ( UART\_Type \* *base*, uart\_singlewire\_txdirection\_t *direction* ) [inline], [static]**

This function configures the transmitter direction when the UART is configured for single-wire operation.

## Parameters

|                  |                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>      | UART module base pointer.                                                                                                                                                                      |
| <i>direction</i> | The UART single-wire mode transmit direction configuration of type <code>uart_singlewire_txdir_t</code> (either <code>kUartSinglewireTxdirIn</code> or <code>kUartSinglewireTxdirOut</code> ). |

**74.5.26 `uart_status_t UART_HAL_PutReceiverInStandbyMode ( UART_Type * base )`**

This function, when called, places the UART receiver into standby mode. In some UART bases, there are conditions that must be met before placing Rx in standby mode. Before placing UART in standby, determine if receiver is set to wake on idle, and if receiver is already in idle state. NOTE: RWU should only be set with `C1[WAKE] = 0` (wakeup on idle) if the channel is currently not idle. This can be determined by the `S2[RAF]` flag. If set to wake up FROM an IDLE event and the channel is already idle, it is possible that the UART discards data because data must be received (or a LIN break detect) after an IDLE is detected before IDLE is allowed to be reasserted.

## Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

## Returns

Error code or `kStatus_UART_Success`.

**74.5.27 `static void UART_HAL_PutReceiverInNormalMode ( UART_Type * base ) [inline], [static]`**

This function, when called, places the UART receiver into normal mode and out of standby mode.

## Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

**74.5.28 `static bool UART_HAL_IsReceiverInStandby ( UART_Type * base ) [inline], [static]`**

This function determines the state of the UART receiver. If it returns true, this means that the UART receiver is in standby mode; if it returns false, the UART receiver is in normal mode.

## Function Documentation

### Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

### Returns

The UART receiver is in normal mode (false) or standby mode (true).

#### 74.5.29 **static void UART\_HAL\_SetReceiverWakeupMethod ( UART\_Type \* *base*, uart\_wakeup\_method\_t *method* ) [inline], [static]**

This function configures the wakeup method of the UART receiver from standby mode. The options are idle-line wake or address-mark wake.

### Parameters

|               |                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | UART module base pointer.                                                                                             |
| <i>method</i> | The UART receiver wakeup method options: kUartIdleLineWake - Idle-line wake or kUartAddrMarkWake - address-mark wake. |

#### 74.5.30 **static uart\_wakeup\_method\_t UART\_HAL\_GetReceiverWakeupMethod ( UART\_Type \* *base* ) [inline], [static]**

This function returns how the UART receiver is configured to wake from standby mode. The wake method options that can be returned are kUartIdleLineWake or kUartAddrMarkWake.

### Parameters

|             |                           |
|-------------|---------------------------|
| <i>base</i> | UART module base pointer. |
|-------------|---------------------------|

### Returns

The UART receiver wakeup from standby method, false: kUartIdleLineWake (idle-line wake) or true: kUartAddrMarkWake (address-mark wake).

#### 74.5.31 **void UART\_HAL\_ConfigIdleLineDetect ( UART\_Type \* *base*, uint8\_t *idleLine*, uint8\_t *rxWakeldleDetect* )**

This function allows the user to configure the UART idle-line detect operation. There are two separate operations for the user to configure, the idle line bit-count start and the receive wake up affect on IDLE status bit. The user passes in a structure of type `uart_idle_line_config_t`.

## Parameters

|                          |                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>              | UART module base pointer.                                                                                                                                                                                                                     |
| <i>idleLine</i>          | Idle bit count start: 0 - after start bit (default), 1 - after stop bit                                                                                                                                                                       |
| <i>rxWakeIdle-Detect</i> | Receiver Wake Up Idle Detect. IDLE status bit operation during receive standby. Controls whether idle character that wakes up receiver also sets IDLE status bit. 0 - IDLE status bit doesn't get set (default), 1 - IDLE status bit gets set |

**74.5.32 static void UART\_HAL\_SetBreakCharTransmitLength ( UART\_Type \* *base*, uart\_break\_char\_length\_t *length* ) [inline], [static]**

This function allows the user to configure the UART break character transmit length. Refer to the typedef `uart_break_char_length_t` for setting options. In some UART bases it is required that the transmitter be disabled before calling this function. This may be applied to all UARTs to ensure safe operation.

## Parameters

|               |                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | UART module base pointer.                                                                                                                        |
| <i>length</i> | The UART break character length setting of type <code>uart_break_char_length_t</code> , either a minimum 10-bit times or a minimum 13-bit times. |

**74.5.33 static void UART\_HAL\_SetBreakCharCmd ( UART\_Type \* *base*, bool *enable* ) [inline], [static]**

This function allows the user to queue a UART break character to send. If true is passed into the function, then a break character is queued for transmission. A break character is continuously queued until this function is called again when a false is passed into this function.

## Parameters

|               |                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | UART module base pointer.                                                                                                                                                               |
| <i>enable</i> | If false, the UART normal/queue break character setting is disabled, which configures the UART for normal transmitter operation. If true, a break character is queued for transmission. |

## Function Documentation

**74.5.34 void UART\_HAL\_SetMatchAddress ( UART\_Type \* *base*, bool *matchAddrMode1*, bool *matchAddrMode2*, uint8\_t *matchAddrValue1*, uint8\_t *matchAddrValue2* )**

(Note: Feature available on select UART bases)

The function allows the user to configure the UART match address control operation. The user has the option to enable the match address mode and to program the match address value. There are two match address modes, each with its own enable and programmable match address value.

Parameters

|                         |                                                                           |
|-------------------------|---------------------------------------------------------------------------|
| <i>base</i>             | UART module base pointer.                                                 |
| <i>matchAddr-Mode1</i>  | If true, this enables match address mode 1 (MAEN1), where false disables. |
| <i>matchAddr-Mode2</i>  | If true, this enables match address mode 2 (MAEN2), where false disables. |
| <i>matchAddr-Value1</i> | The match address value to program for match address mode 1.              |
| <i>matchAddr-Value2</i> | The match address value to program for match address mode 2.              |

## 74.6 UART Peripheral driver

### 74.6.1 Overview

This section describes the programming interface of the UART Peripheral driver. The UART peripheral driver transfers data to and from external devices on the Universal Asynchronous Receiver/Transmitter (UART) serial bus with a single function call.

### 74.6.2 UART Device structures

The driver uses an instantiation of the `uart_state_t` structure to maintain the current state of a particular UART instance module driver. This structure holds data that is used by the UART Peripheral driver to communicate between the transmit and receive transfer functions and the interrupt handler. The interrupt handler also uses this information to keep track of its progress. Because the driver itself does not statically allocate memory, the caller provides memory for the driver state structure during initialization by providing a structure. The UART driver populates the structure members.

### 74.6.3 UART User configuration structures

The UART driver uses instances of the user configuration structure `uart_user_config_t` for the UART driver. This enables configuration of the most common settings of the UART with a single function call. Settings include: UART baud rate, UART parity mode: disabled (default), or even or odd, the number of stop bits, and the number of bits per data word.

### 74.6.4 UART Initialization

1. To initialize the UART driver, call the `UART_DRV_Init()` function and pass the instance number of the UART peripheral, memory for the run-time state structure, and a pointer to the user configuration structure. For example, to use UART0 pass a value of 0 to the initialization function.
2. Then, pass the memory for the run-time state structure.
3. Finally, pass a user configuration structure of the type `uart_user_config_t` as shown here:

```
// UART configuration structure
typedef struct UartUserConfig {
 uint32_t baudRate;
 uart_parity_mode_t parityMode;
 uart_stop_bit_count_t stopBitCount;
 uart_bit_count_per_char_t bitCountPerChar;
} uart_user_config_t;
```

Typically, the `uart_user_config_t` instantiation is configured as 8-bit-char, no-parity, 1-stop-bit (8-n-1) with a 9600 bps baud rate. The `uart_user_config_t` instantiation can be easily modified to configure the UART Peripheral driver either to a different baud rate or character transfer features. This is an example code to set up a user UART configuration instantiation:

## UART Peripheral driver

```
uart_user_config_t uartConfig;
uartConfig.baudRate = 9600;
uartConfig.bitCountPerChar = kUart8BitsPerChar;
uartConfig.parityMode = kUartParityDisabled;
uartConfig.stopBitCount = kUartOneStopBit;
```

This example shows how to call the `UART_DRV_Init()` given the user configuration structure and the UART instance 0.

```
uint32_t uartInstance = 0;
uart_state_t uartState; // user provides memory for the driver state structure

UART_DRV_Init(uartInstance, &uartConfig, &uartState);
```

### 74.6.5 UART Transfers

The driver implements transmit and receive functions to transfer buffers of data in blocking and non-blocking modes.

The non-blocking transmit and receive functions include the `UART_DRV_SendData()` and `UART_DRV_ReceiveData()` functions.

The blocking (async) transmit and receive functions include the `UART_DRV_SendDataBlocking()` and `UART_DRV_ReceiveDataBlocking()` functions.

When using DMA to transfer data, ensure that data is consistent because of the cache for memory. In other words, when reading/ writing the data from/to memory, the application should ensure that data from or to the memory device is not cached.

In all cases mentioned here, the functions are interrupt-driven.

This code examples show how to use the functions, assuming that the UART module has been initialized as described previously in the Initialization Section.

For blocking transfer functions transmit and receive:

```
uint8_t sourceBuff[26] = {0}; // sourceBuff can be filled out with desired data
uint8_t readBuffer[10] = {0}; // readBuffer gets filled with UART_DRV_ReceiveData function

uint32_t byteCount = sizeof(sourceBuff);
uint32_t rxRemainingSize = sizeof(readBuffer);

// for each use there, set timeout as "1"
// uartState is the run-time state. Pass in memory for this
// declared previously in the initialization chapter
UART_DRV_SendDataBlocking(uartInstance, sourceBuff, byteCount, 1); // Function
 won't return until transmit is complete
UART_DRV_ReceiveDataBlocking(uartInstance, readBuffer, 1, timeoutValue); //
 Function won't return until it receives all data
```

For non-blocking (async) transfer functions transmit and receive:

```
uint8_t *pTxBuff;
uint8_t rxBuff[10];
```

```
uint32_t txBytesRemaining, rxBytesRemaining;

// Assume pTxBuff and txSize have been initialized
UART_DRV_SendData(uartInstance, pTxBuff, txSize);

// Check on status of transmit and wait until done; the code can do something else and
// check back later
while (UART_DRV_GetTransmitStatus(uartInstance, &txBytesRemaining) ==
 kStatus_UART_TxBusy);

// For receive, assume rxBuff is set up to receive data and rxSize is initialized
UART_DRV_ReceiveData(uartInstance, rxBuff, rxSize);

// Check on status of receive and wait until done; the code can do something else and
// check back later
while (UART_DRV_GetReceiveStatus(uartInstance, &rxBytesRemaining) ==
 kStatus_UART_RxBusy);
```

### Files

- file [fsl\\_uart\\_driver.h](#)  
Some devices count the UART instances with LPUART(e.g., KL27) or UART0(e.g., KL25) together.

### Data Structures

- struct [uart\\_state\\_t](#)  
Runtime state of the UART driver. [More...](#)

## UART Peripheral driver

- Initializes an UART instance for operation.*

  - `uart_status_t UART_DRV_Deinit` (uint32\_t instance)

*Shuts down the UART by disabling interrupts and the transmitter/receiver.*
- `uart_rx_callback_t UART_DRV_InstallRxCallback` (uint32\_t instance, `uart_rx_callback_t` function, uint8\_t \*rxBuff, void \*callbackParam, bool alwaysEnableRxIrq)

*Installs the callback function for the UART receive.*
- `uart_tx_callback_t UART_DRV_InstallTxCallback` (uint32\_t instance, `uart_tx_callback_t` function, uint8\_t \*txBuff, void \*callbackParam)

*Installs the callback function for the UART transmit.*
- `uart_status_t UART_DRV_SendDataBlocking` (uint32\_t instance, const uint8\_t \*txBuff, uint32\_t txSize, uint32\_t timeout)

*Sends (transmits) data out through the UART module using a blocking method.*
- `uart_status_t UART_DRV_SendData` (uint32\_t instance, const uint8\_t \*txBuff, uint32\_t txSize)

*Sends (transmits) data through the UART module using a non-blocking method.*
- `uart_status_t UART_DRV_GetTransmitStatus` (uint32\_t instance, uint32\_t \*bytesRemaining)

*Returns whether the previous UART transmit has finished.*
- `uart_status_t UART_DRV_AbortSendingData` (uint32\_t instance)

*Terminates an asynchronous UART transmission early.*
- `uart_status_t UART_DRV_ReceiveDataBlocking` (uint32\_t instance, uint8\_t \*rxBuff, uint32\_t rxSize, uint32\_t timeout)

*Gets (receives) data from the UART module using a blocking method.*
- `uart_status_t UART_DRV_ReceiveData` (uint32\_t instance, uint8\_t \*rxBuff, uint32\_t rxSize)

*Gets (receives) data from the UART module using a non-blocking method.*
- `uart_status_t UART_DRV_GetReceiveStatus` (uint32\_t instance, uint32\_t \*bytesRemaining)

*Returns whether the previous UART receive is complete.*
- `uart_status_t UART_DRV_AbortReceivingData` (uint32\_t instance)

*Terminates an asynchronous UART receive early.*

### 74.6.6 Data Structure Documentation

#### 74.6.6.1 struct uart\_state\_t

This structure holds data that are used by the UART peripheral driver to communicate between the transfer function and the interrupt handler. The interrupt handler also uses this information to keep track of its progress. The user passes in the memory for the run-time state structure and the UART driver fills out the members.

#### Data Fields

- uint8\_t `txFifoEntryCount`  
*Number of data word entries in TX FIFO.*
- const uint8\_t \* `txBuff`  
*The buffer of data being sent.*
- uint8\_t \* `rxBuff`  
*The buffer of received data.*
- volatile size\_t `txSize`  
*The remaining number of bytes to be transmitted.*

- volatile size\_t `rxSize`  
*The remaining number of bytes to be received.*
- volatile bool `isTxBusy`  
*True if there is an active transmit.*
- volatile bool `isRxBusy`  
*True if there is an active receive.*
- volatile bool `isTxBlocking`  
*True if transmit is blocking transaction.*
- volatile bool `isRxBlocking`  
*True if receive is blocking transaction.*
- semaphore\_t `txIrqSync`  
*Used to wait for ISR to complete its TX business.*
- semaphore\_t `rxIrqSync`  
*Used to wait for ISR to complete its RX business.*
- uart\_rx\_callback\_t `rxCallback`  
*Callback to invoke after receiving byte.*
- void \* `rxCallbackParam`  
*Receive callback parameter pointer.*
- uart\_tx\_callback\_t `txCallback`  
*Callback to invoke after transmitting byte.*
- void \* `txCallbackParam`  
*Transmit callback parameter pointer.*

74.6.6.1.0.16.15 `void* uart_state_t::txCallbackParam`

### 74.6.6.2 struct `uart_user_config_t`

Use an instance of this structure with the `UART_DRV_Init()` function. This enables configuration of the most common settings of the UART peripheral with a single function call. Settings include: UART baud rate, UART parity mode: disabled (default), or even or odd, the number of stop bits, and the number of bits per data word.

#### Data Fields

- `uint32_t baudRate`  
*UART baud rate.*
- `uart_parity_mode_t parityMode`  
*parity mode, disabled (default), even, odd*
- `uart_stop_bit_count_t stopBitCount`  
*number of stop bits, 1 stop bit (default) or 2 stop bits*
- `uart_bit_count_per_char_t bitCountPerChar`  
*number of bits, 8-bit (default) or 9-bit in a word (up to 10-bits in some UART instances)*

## 74.6.7 Function Documentation

### 74.6.7.1 `uart_status_t` UART\_DRV\_Init ( `uint32_t` *instance*, `uart_state_t` \* *uartStatePtr*, `const` `uart_user_config_t` \* *uartUserConfig* )

This function initializes the run-time state structure to keep track of the on-going transfers, un-gates the clock to the UART module, initializes the module to user-defined settings and default settings, configures the IRQ state structure, and enables the module-level interrupt to the core, and the UART module transmitter and receiver. This example shows how to set up the `uart_state_t` and the `uart_user_config_t` parameters and how to call the UART\_DRV\_Init function by passing in these parameters:

```
uart_user_config_t uartConfig;
uartConfig.baudRate = 9600;
uartConfig.bitCountPerChar = kUart8BitsPerChar;
uartConfig.parityMode = kUartParityDisabled;
uartConfig.stopBitCount = kUartOneStopBit;
uart_state_t uartState;
UART_DRV_Init(instance, &uartState, &uartConfig);
```

#### Parameters

|                       |                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>       | The UART instance number.                                                                                                                                                                                                                  |
| <i>uartStatePtr</i>   | A pointer to the UART driver state structure memory. The user passes in the memory for this run-time state structure. The UART driver populates the members. The run-time state structure keeps track of the current transfer in progress. |
| <i>uartUserConfig</i> | The user configuration structure of type <code>uart_user_config_t</code> . The user populates the members of this structure and passes the pointer of this structure to this function.                                                     |

#### Returns

An error code or `kStatus_UART_Success`.

### 74.6.7.2 `uart_status_t` UART\_DRV\_Deinit ( `uint32_t` *instance* )

This function disables the UART interrupts, the transmitter and receiver, and flushes the FIFOs (for modules that support FIFOs).

#### Parameters

---

## UART Peripheral driver

|                 |                           |
|-----------------|---------------------------|
| <i>instance</i> | The UART instance number. |
|-----------------|---------------------------|

Returns

An error code or kStatus\_UART\_Success.

### 74.6.7.3 `uart_rx_callback_t` `UART_DRV_InstallRxCallback ( uint32_t instance, uart_rx_callback_t function, uint8_t * rxBuff, void * callbackParam, bool alwaysEnableRxIrq )`

Note

After a callback is installed, it bypasses part of the UART IRQHandler logic. So, the callback needs to handle the indexes of rxBuff, rxSize.

Parameters

|                           |                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------|
| <i>instance</i>           | The UART instance number.                                                                             |
| <i>function</i>           | The UART receive callback function.                                                                   |
| <i>rxBuff</i>             | The receive buffer used inside IRQHandler. This buffer must be kept as long as the callback is alive. |
| <i>callbackParam</i>      | The UART receive callback parameter pointer.                                                          |
| <i>alwaysEnable-RxIrq</i> | Whether always enable receive IRQ or not.                                                             |

Returns

Former UART receive callback function pointer.

### 74.6.7.4 `uart_tx_callback_t` `UART_DRV_InstallTxCallback ( uint32_t instance, uart_tx_callback_t function, uint8_t * txBuff, void * callbackParam )`

Note

After a callback is installed, it bypasses part of the UART IRQHandler logic. Therefore, the callback needs to handle the txBuff and txSize indexes.

## Parameters

|                      |                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------|
| <i>instance</i>      | The UART instance number.                                                                              |
| <i>function</i>      | The UART transmit callback function.                                                                   |
| <i>txBuff</i>        | The transmit buffer used inside IRQHandler. This buffer must be kept as long as the callback is alive. |
| <i>callbackParam</i> | The UART transmit callback parameter pointer.                                                          |

## Returns

Former UART transmit callback function pointer.

**74.6.7.5 `uart_status_t UART_DRV_SendDataBlocking ( uint32_t instance, const uint8_t * txBuff, uint32_t txSize, uint32_t timeout )`**

A blocking (also known as synchronous) function means that the function does not return until the transmit is complete. This blocking function is used to send data through the UART port.

## Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The UART instance number.                                               |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send.     |
| <i>txSize</i>   | The number of bytes to send.                                            |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

## Returns

An error code or `kStatus_UART_Success`.

**74.6.7.6 `uart_status_t UART_DRV_SendData ( uint32_t instance, const uint8_t * txBuff, uint32_t txSize )`**

A non-blocking (also known as asynchronous) function means that the function returns immediately after initiating the transmit function. The application has to get the transmit status to see when the transmit is complete. In other words, after calling non-blocking (asynchronous) send function, the application must get the transmit status to check if transmit is complete. The asynchronous method of transmitting and receiving allows the UART to perform a full duplex operation (simultaneously transmit and receive).

## UART Peripheral driver

### Parameters

|                 |                                                                     |
|-----------------|---------------------------------------------------------------------|
| <i>instance</i> | The UART module base address.                                       |
| <i>txBuff</i>   | A pointer to the source buffer containing 8-bit data chars to send. |
| <i>txSize</i>   | The number of bytes to send.                                        |

### Returns

An error code or `kStatus_UART_Success`.

### 74.6.7.7 `uart_status_t` `UART_DRV_GetTransmitStatus` ( `uint32_t instance`, `uint32_t * bytesRemaining` )

When performing an a-sync transmit, call this function to ascertain the state of the current transmission: in progress (or busy) or complete (success). If the transmission is still in progress, the user can obtain the number of words that have been transferred.

### Parameters

|                        |                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The UART module base address.                                                                              |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes that are remaining in the active transfer. |

### Returns

The transmit status.

### Return values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_UART_Success</i> | The transmit has completed successfully.                                                                                              |
| <i>kStatus_UART_TxBusy</i>  | The transmit is still in progress. <i>bytesTransmitted</i> is filled with the number of bytes which are transmitted up to that point. |

### 74.6.7.8 `uart_status_t` `UART_DRV_AbortSendingData` ( `uint32_t instance` )

During an a-sync UART transmission, the user can terminate the transmission early if the transmission is still in progress.

## Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>instance</i> | The UART module base address. |
|-----------------|-------------------------------|

## Returns

Whether the aborting success or not.

## Return values

|                                           |                                           |
|-------------------------------------------|-------------------------------------------|
| <i>kStatus_UART_Success</i>               | The transmit was successful.              |
| <i>kStatus_UART_No-TransmitInProgress</i> | No transmission is currently in progress. |

**74.6.7.9 uart\_status\_t UART\_DRV\_ReceiveDataBlocking ( uint32\_t *instance*, uint8\_t \* *rxBuff*, uint32\_t *rxSize*, uint32\_t *timeout* )**

A blocking (also known as synchronous) function means that the function does not return until the receive is complete. This blocking function sends data through the UART port.

## Parameters

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <i>instance</i> | The UART module base address.                                           |
| <i>rxBuff</i>   | A pointer to the buffer containing 8-bit read data chars received.      |
| <i>rxSize</i>   | The number of bytes to receive.                                         |
| <i>timeout</i>  | A timeout value for RTOS abstraction sync control in milliseconds (ms). |

## Returns

An error code or kStatus\_UART\_Success.

**74.6.7.10 uart\_status\_t UART\_DRV\_ReceiveData ( uint32\_t *instance*, uint8\_t \* *rxBuff*, uint32\_t *rxSize* )**

A non-blocking (also known as asynchronous) function means that the function returns immediately after initiating the receive function. The application has to get the receive status to see when the receive is complete. In other words, after calling non-blocking (asynchronous) get function, the application must get the receive status to check if receive is completed or not. The asynchronous method of transmitting and receiving allows the UART to perform a full duplex operation (simultaneously transmit and receive).

## UART Peripheral driver

### Parameters

|                 |                                                                    |
|-----------------|--------------------------------------------------------------------|
| <i>instance</i> | The UART module base address.                                      |
| <i>rxBuff</i>   | A pointer to the buffer containing 8-bit read data chars received. |
| <i>rxSize</i>   | The number of bytes to receive.                                    |

### Returns

An error code or `kStatus_UART_Success`.

### 74.6.7.11 `uart_status_t UART_DRV_GetReceiveStatus ( uint32_t instance, uint32_t * bytesRemaining )`

When performing an a-sync receive, call this function to find out the state of the current receive progress: in progress (or busy) or complete (success). In addition, if the receive is still in progress, the user can obtain the number of words that have been currently received.

### Parameters

|                        |                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i>        | The UART module base address.                                                                                           |
| <i>bytes-Remaining</i> | A pointer to a value that is filled in with the number of bytes which still need to be received in the active transfer. |

### Returns

The receive status.

### Return values

|                             |                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>kStatus_UART_Success</i> | The receive has completed successfully.                                                                                        |
| <i>kStatus_UART_RxBusy</i>  | The receive is still in progress. <i>bytesReceived</i> is filled with the number of bytes which are received up to that point. |

### 74.6.7.12 `uart_status_t UART_DRV_AbortReceivingData ( uint32_t instance )`

During an a-sync UART receive, the user can terminate the receive early if the receive is still in progress.

Parameters

|                 |                               |
|-----------------|-------------------------------|
| <i>instance</i> | The UART module base address. |
|-----------------|-------------------------------|

Returns

Whether the aborting success or not.

Return values

|                                           |                                      |
|-------------------------------------------|--------------------------------------|
| <i>kStatus_UART_Success</i>               | The receive was successful.          |
| <i>kStatus_UART_No-TransmitInProgress</i> | No receive is currently in progress. |

*Wait to internal voltage stable.*
- static void `VREF_HAL_SetBufferMode` (VREF\_Type \*base, `vref_buffer_mode_t` mode)  
*Set buffer mode.*

## 75.2.2 Data Structure Documentation

### 75.2.2.1 struct vref\_user\_config\_t

#### Data Fields

- uint8\_t `trimValue`  
*Trim bits.*
- bool `regulatorEnable`  
*Enable regulator.*
- `vref_buffer_mode_t` `bufferMode`  
*Buffer mode selection.*

## 75.2.3 Enumeration Type Documentation

### 75.2.3.1 enum vref\_status\_t

VREF status return codes

Enumerator

- `kStatus_VREF_Success` Success.
- `kStatus_VREF_InvalidArgument` Invalid argument existed.
- `kStatus_VREF_Failed` Execution failed.

### 75.2.3.2 enum vref\_buffer\_mode\_t

Enumerator

- `kVrefModeBandgapOnly` Bandgap on only. For stabilization and startup
- `kVrefModeTightRegulationBuffer` Tight regulation buffer enabled.

## 75.2.4 Function Documentation

### 75.2.4.1 void VREF\_HAL\_Init ( VREF\_Type \* base )

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | VREF module base number. |
|-------------|--------------------------|

**75.2.4.2 void VREF\_HAL\_Configure ( VREF\_Type \* *base*, const vref\_user\_config\_t \* *userConfigPtr* )**

Parameters

|                      |                                                                        |
|----------------------|------------------------------------------------------------------------|
| <i>base</i>          | VREF module base number.                                               |
| <i>userConfigPtr</i> | Pointer to the initialization structure. See the "vref_user_config_t". |

**75.2.4.3 static void VREF\_HAL\_Enable ( VREF\_Type \* *base* ) [inline], [static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | VREF module base number. |
|-------------|--------------------------|

**75.2.4.4 static void VREF\_HAL\_Disable ( VREF\_Type \* *base* ) [inline], [static]**

Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | VREF module base number. |
|-------------|--------------------------|

**75.2.4.5 static void VREF\_HAL\_SetInternalRegulatorCmd ( VREF\_Type \* *base*, bool *enable* ) [inline], [static]**

Cannot be enabled in very low-power modes!

Parameters

|               |                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i>   | VREF module base number.                                                                                                                                                 |
| <i>enable</i> | Enables or disables internal regulator <ul style="list-style-type: none"> <li>• true : Internal regulator enable</li> <li>• false: Internal regulator disable</li> </ul> |

---

## VREF HAL Driver

75.2.4.6 `static void VREF_HAL_SetTrimVal ( VREF_Type * base, uint8_t trimValue )`  
`[inline], [static]`

## Parameters

|                  |                                                                            |
|------------------|----------------------------------------------------------------------------|
| <i>base</i>      | VREF module base number.                                                   |
| <i>trimValue</i> | Value of trim register to set output reference voltage (max 0x3F (6-bit)). |

**75.2.4.7** `static uint8_t VREF_HAL_GetTrimVal ( VREF_Type * base ) [inline], [static]`

## Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | VREF module base number. |
|-------------|--------------------------|

## Returns

Six-bit value of trim setting.

**75.2.4.8** `static void VREF_HAL_WaitVoltageStable ( VREF_Type * base ) [inline], [static]`

## Parameters

|             |                          |
|-------------|--------------------------|
| <i>base</i> | VREF module base number. |
|-------------|--------------------------|

**75.2.4.9** `static void VREF_HAL_SetBufferMode ( VREF_Type * base, vref_buffer_mode_t mode ) [inline], [static]`

## Parameters

|             |                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>base</i> | VREF module base number.                                                                                                                                                                                                                                                                                                           |
| <i>mode</i> | Defines mode to be set. <ul style="list-style-type: none"> <li>• kVrefModeBandgapOnly : Set Bandgap on only</li> <li>• kVrefModeHighPowerBuffer : Set High power buffer mode</li> <li>• kVrefModeLowPowerBuffer : Set Low power buffer mode</li> <li>• kVrefModeTightRegulationBuffer: Set Tight regulation buffer mode</li> </ul> |

## 75.3 VREF Peripheral driver

### 75.3.1 Overview

This section describes the programming interface of the VREF Peripheral driver. The VREF Peripheral driver configures the Voltage Reference (VREF). It handles initialization and configuration of Voltage Reference (VREF) module.

### 75.3.2 VREF Initialization

To initialize the VREF module, call the `VREF_DRV_Init()` function and pass in the user configuration structure. This function automatically enables the WDOG module and clock.

This example code shows how to initialize and configure the driver:

```

vref_user_config_t vrefConfig =
{
#if FSL_FEATURE_VREF_HAS_CHOP_OSC
 .chopOscEnable = true,
#endif
 .trimValue = 0,
 .regulatorEnable = true,
#if FSL_FEATURE_VREF_HAS_COMPENSATION
 .soccEnable = true,
#endif
 .bufferMode = kVrefModeHighPowerBuffer
};

// Initialize VREF
VREF_DRV_Init(VREF_IDX, &vrefConfig);

```

### VREF set output result

To set the resulting VREF by approximately  $\pm 0.5$  mV for each step, call `VREF_DRV_SetTrimValue()` function and pass the TRIM value.

```

// These bits change the resulting VREF
VREF_DRV_SetTrimValue(VREF_IDX, trimValue);

```

### Files

- file `fsl_vref_driver.h`

### Functions

- `vref_status_t VREF_DRV_Init` (uint32\_t instance, const `vref_user_config_t *userConfigPtr`)  
*Initializes the VREF module.*
- `vref_status_t VREF_DRV_Deinit` (uint32\_t instance)

## VREF Peripheral driver

- *De-initializes the VREF module.*
- `vref_status_t VREF_DRV_SetTrimValue` (uint32\_t instance, uint8\_t trimValue)  
*Sets the TRIM bits value.*
- static `uint8_t VREF_DRV_GetTrimValue` (uint32\_t instance)  
*Get TRIM bits value was set.*
- static `vref_status_t VREF_DRV_SetRegulator` (uint32\_t instance, bool enable)  
*Enables or disables the regulator.*
- static `vref_status_t VREF_DRV_SetBufferMode` (uint32\_t instance, `vref_buffer_mode_t` bufferMode)  
*Sets the buffer mode.*

### 75.3.3 Function Documentation

#### 75.3.3.1 `vref_status_t VREF_DRV_Init ( uint32_t instance, const vref_user_config_t * userConfigPtr )`

Parameters

|                      |                                                                        |
|----------------------|------------------------------------------------------------------------|
| <i>instance</i>      | VREF instance.                                                         |
| <i>userConfigPtr</i> | Pointer to the initialization structure. See the "vref_user_config_t". |

Returns

Execution status.

#### 75.3.3.2 `vref_status_t VREF_DRV_Deinit ( uint32_t instance )`

Parameters

|                 |                |
|-----------------|----------------|
| <i>instance</i> | VREF instance. |
|-----------------|----------------|

Returns

Execution status.

#### 75.3.3.3 `vref_status_t VREF_DRV_SetTrimValue ( uint32_t instance, uint8_t trimValue )`

These bits change the resulting VREF by approximately +/- 0.5 mV for each step. For minimum and maximum voltage reference output values, see the Data Sheet for this chip.

Parameters

|                  |                  |
|------------------|------------------|
| <i>instance</i>  | VREF instance.   |
| <i>trimValue</i> | TRIM bits value. |

Returns

Execution status.

**75.3.3.4 static uint8\_t VREF\_DRV\_GetTrimValue ( uint32\_t *instance* ) [inline], [static]**

Parameters

|                 |                |
|-----------------|----------------|
| <i>instance</i> | VREF instance. |
|-----------------|----------------|

Returns

Actual TRIM bits value.

**75.3.3.5 static vref\_status\_t VREF\_DRV\_SetRegulator ( uint32\_t *instance*, bool *enable* ) [inline], [static]**

This bit is used to enable the internal 1.75 V regulator to produce a constant internal voltage supply to reduce the sensitivity to the external supply noise and variation. To keep the regulator enabled in very low power modes, see the Chip Configuration details for a description. This bit is set during factory trimming of the VREF voltage and should be written to 1 to achieve the performance stated in the data sheet.

Parameters

|                 |                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>instance</i> | VREF instance.                                                                                                                                                           |
| <i>enable</i>   | Enables or disables internal regulator <ul style="list-style-type: none"> <li>• true : Internal regulator enable</li> <li>• false: Internal regulator disable</li> </ul> |

## VREF Peripheral driver

Returns

Execution status.

**75.3.3.6** `static vref_status_t VREF_DRV_SetBufferMode ( uint32_t instance,  
vref_buffer_mode_t bufferMode ) [inline], [static]`

These bits select the buffer modes for the Voltage Reference module.

- Buffer mode = 0x00: The internal VREF bandgap is enabled to generate an accurate 1.2 V output that can be trimmed with the TRM register TRIM[5:0] bit field. The bandgap requires some time for startup and stabilization. SC[VREFST] can be monitored to determine if the stabilization and startup is complete.
- Buffer mode = 0x01: The internal VREF bandgap is on. The high power buffer is enabled to generate a buffered 1.2 V voltage to VREF\_OUT.
- Buffer mode = 0x02: The internal VREF bandgap is on. The high power buffer is enabled to generate a buffered 1.2 V voltage to VREF\_OUT.

VREF\_OUT generated by high and low buffer modes can also be used as a reference to internal analog peripherals such as an ADC channel or analog comparator input. If those modes is entered from the standby mode, there is a delay before the buffer output is settled at the final value. A 100 nF capacitor is required to connect between the VREF\_OUT pin and VSSA.

Parameters

|                   |                    |
|-------------------|--------------------|
| <i>instance</i>   | VREF instance.     |
| <i>bufferMode</i> | Buffer mode value. |

Returns

Execution status.

## Chapter 76

### Watchdog Timer (WDOG)

#### 76.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Watchdog Timer (WDOG) block of Kinetis devices.

#### Modules

- [WDOG HAL driver](#)
- [WDOG Peripheral driver](#)

## WDOG HAL driver

### 76.2 WDOG HAL driver

#### 76.2.1 Overview

This section describes the programming interface of the WDOG HAL driver.

#### Data Structures

- struct [wdog\\_work\\_mode\\_t](#)  
*Describes WDOG work mode structure. [More...](#)*
- struct [wdog\\_config\\_t](#)  
*Describes WDOG configuration structure. [More...](#)*

#### Enumerations

- enum [wdog\\_clk\\_src\\_t](#) {  
    [kWdogLpoClkSrc](#) = 0U,  
    [kWdogAlternateClkSrc](#) = 1U }  
*Describes WDOG clock source structure.*
- enum [wdog\\_clk\\_prescaler\\_t](#) {  
    [kWdogClkPrescalerDivide1](#) = 0x0U,  
    [kWdogClkPrescalerDivide2](#) = 0x1U,  
    [kWdogClkPrescalerDivide3](#) = 0x2U,  
    [kWdogClkPrescalerDivide4](#) = 0x3U,  
    [kWdogClkPrescalerDivide5](#) = 0x4U,  
    [kWdogClkPrescalerDivide6](#) = 0x5U,  
    [kWdogClkPrescalerDivide7](#) = 0x6U,  
    [kWdogClkPrescalerDivide8](#) = 0x7U }  
*Describes the selection of the clock prescaler.*
- enum [wdog\\_status\\_t](#) {  
    [kStatus\\_WDOG\\_Success](#) = 0x0U,  
    [kStatus\\_WDOG\\_Fail](#) = 0x1U,  
    [kStatus\\_WDOG\\_NotInitialized](#) = 0x2U,  
    [kStatus\\_WDOG\\_NullArgument](#) = 0x3U }  
*WDOG status return codes.*

#### Watchdog HAL.

- static void [WDOG\\_HAL\\_Enable](#) (WDOG\_Type \*base)  
*Enables the Watchdog module.*
- static void [WDOG\\_HAL\\_Disable](#) (WDOG\_Type \*base)  
*Disables the Watchdog module.*
- static bool [WDOG\\_HAL\\_IsEnable](#) (WDOG\_Type \*base)  
*Checks whether the WDOG is enabled.*
- void [WDOG\\_HAL\\_SetConfig](#) (WDOG\_Type \*base, const [wdog\\_config\\_t](#) \*configPtr)

- *Sets the WDOG common configuration.*
- static void [WDOG\\_HAL\\_SetIntCmd](#) (WDOG\_Type \*base, bool enable)  
*Enables and disables the Watchdog interrupt.*
- static bool [WDOG\\_HAL\\_GetIntFlag](#) (WDOG\_Type \*base)  
*Gets the Watchdog interrupt status.*
- static void [WDOG\\_HAL\\_ClearIntStatusFlag](#) (WDOG\_Type \*base)  
*Clears the Watchdog interrupt flag.*
- static void [WDOG\\_HAL\\_SetTimeoutValue](#) (WDOG\_Type \*base, uint32\_t timeoutCount)  
*Sets the Watchdog timeout value.*
- static uint32\_t [WDOG\\_HAL\\_GetTimerOutputValue](#) (WDOG\_Type \*base)  
*Gets the Watchdog timer output.*
- static void [WDOG\\_HAL\\_SetWindowValue](#) (WDOG\_Type \*base, uint32\_t windowValue)  
*Sets the Watchdog window value.*
- static void [WDOG\\_HAL\\_Unlock](#) (WDOG\_Type \*base)  
*Unlocks the Watchdog register written.*
- static void [WDOG\\_HAL\\_Refresh](#) (WDOG\_Type \*base)  
*Refreshes the Watchdog timer.*
- static void [WDOG\\_HAL\\_ResetSystem](#) (WDOG\_Type \*base)  
*Resets the chip using the Watchdog.*
- void [WDOG\\_HAL\\_Init](#) (WDOG\_Type \*base)  
*Restores the WDOG module to reset value.*

## 76.2.2 Data Structure Documentation

### 76.2.2.1 struct wdog\_work\_mode\_t

#### Data Fields

- bool [kWdogEnableInStopMode](#)  
*Enables or disables WDOG in stop mode.*
- bool [kWdogEnableInDebugMode](#)  
*Enables or disables WDOG in debug mode.*

### 76.2.2.2 struct wdog\_config\_t

#### Data Fields

- bool [wdogEnable](#)  
*Enables or disables WDOG.*
- [wdog\\_clk\\_src\\_t](#) clkSrc  
*Clock source select.*
- [wdog\\_clk\\_prescaler\\_t](#) prescaler  
*Clock prescaler value.*
- [wdog\\_work\\_mode\\_t](#) workMode  
*Configures WDOG work mode in debug stop and wait mode.*
- bool [updateEnable](#)  
*Update write-once register enable.*
- bool [intEnable](#)

## WDOG HAL driver

- *Enables or disables WDOG interrupt.*  
 • bool [winEnable](#)
- *Enables or disables WDOG window mode.*  
 • uint32\_t [windowValue](#)  
*Window value.*
- uint32\_t [timeoutValue](#)  
*Timeout value.*

### 76.2.3 Enumeration Type Documentation

#### 76.2.3.1 enum wdog\_clk\_src\_t

Enumerator

- kWdogLpoClkSrc* WDOG clock sourced from the LPO.
- kWdogAlternateClkSrc* WDOG clock sourced from the alternate clock source.

#### 76.2.3.2 enum wdog\_clk\_prescaler\_t

Enumerator

- kWdogClkPrescalerDivide1* Divided by 1.
- kWdogClkPrescalerDivide2* Divided by 2.
- kWdogClkPrescalerDivide3* Divided by 3.
- kWdogClkPrescalerDivide4* Divided by 4.
- kWdogClkPrescalerDivide5* Divided by 5.
- kWdogClkPrescalerDivide6* Divided by 6.
- kWdogClkPrescalerDivide7* Divided by 7.
- kWdogClkPrescalerDivide8* Divided by 8.

#### 76.2.3.3 enum wdog\_status\_t

Enumerator

- kStatus\_WDOG\_Success* WDOG operation Succeed.
- kStatus\_WDOG\_Fail* WDOG operation Failed.
- kStatus\_WDOG\_NotInitialized* WDOG is not initialized yet.
- kStatus\_WDOG\_NullArgument* Argument is NULL.

## 76.2.4 Function Documentation

### 76.2.4.1 `static void WDOG_HAL_Enable ( WDOG_Type * base ) [inline], [static]`

This function enables the WDOG. Ensure that the WDOG registers are unlocked by the WDOG\_HAL\_Unlock, that the WCT window is still open, and that the WDOG\_STCTRLH register is not written in this WCT while this function is called.

Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

### 76.2.4.2 `static void WDOG_HAL_Disable ( WDOG_Type * base ) [inline], [static]`

This function disables the WDOG. Ensure that the WDOG registers are unlocked by the WDOG\_HAL\_Unlock, that the WCT window is still open, and that the WDOG\_STCTRLH register is not written in this WCT while this function is called.

Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

### 76.2.4.3 `static bool WDOG_HAL_IsEnable ( WDOG_Type * base ) [inline], [static]`

This function checks whether the WDOG is enabled.

Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

Returns

false means WDOG is disabled, true means WDOG is enabled.

### 76.2.4.4 `void WDOG_HAL_SetConfig ( WDOG_Type * base, const wdog_config_t * configPtr )`

This function is used to set the WDOG common configuration. Ensure WDOG registers are unlocked by the WDOG\_HAL\_Unlock, that the WCT window is still open, and that the WDOG\_STCTRLH register is not written in this WCT while this function is called. Additionally, ensure that the WDOG\_STCTRLH.ALLOWUPDATE is 1, which means that the register update is enabled. The common configuration is controlled by the WDOG\_STCTRLH. This is a write-once register and this interface is used to set all field

## WDOG HAL driver

of the WDOG\_STCTRLH registers at the same time. If only one field needs to be set, the API can be used. These API write to the WDOG\_STCTRLH register: [WDOG\\_HAL\\_Enable](#), [WDOG\\_HAL\\_Disable](#), [WDOG\\_HAL\\_SetIntCmd](#), [#WDOG\\_HAL\\_SetClockSourceMode](#), [#WDOG\\_HAL\\_SetWindowModeCmd](#), [#WDOG\\_HAL\\_SetRegisterUpdateCmd](#), [#WDOG\\_HAL\\_SetWorkInDebugModeCmd](#), [#WDOG\\_HAL\\_SetWorkInStopModeCmd](#), [#WDOG\\_HAL\\_SetWorkInWaitModeCmd](#)

Parameters

|                  |                                  |
|------------------|----------------------------------|
| <i>base</i>      | The WDOG peripheral base address |
| <i>configPtr</i> | The common configure of the WDOG |

### 76.2.4.5 static void WDOG\_HAL\_SetIntCmd ( WDOG\_Type \* *base*, bool *enable* ) [inline], [static]

This function enables or disables the WDOG interrupt. Ensure that the WDOG registers are unlocked by the WDOG\_HAL\_Unlock, that the WCT window is still open, and that the WDOG\_STCTRLH register is not written in this WCT while this function is called. Additionally, ensure that the WDOG\_STCTRLH.ALLOWUPDATE is 1, which means that the register update is enabled.

Parameters

|               |                                                                                  |
|---------------|----------------------------------------------------------------------------------|
| <i>base</i>   | The WDOG peripheral base address                                                 |
| <i>enable</i> | false means disable watchdog interrupt and true means enable watchdog interrupt. |

### 76.2.4.6 static bool WDOG\_HAL\_GetIntFlag ( WDOG\_Type \* *base* ) [inline], [static]

This function gets the WDOG interrupt flag.

Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

Returns

Watchdog interrupt status, false means interrupt not asserted, true means interrupt asserted.

### 76.2.4.7 static void WDOG\_HAL\_ClearIntStatusFlag ( WDOG\_Type \* *base* ) [inline], [static]

This function clears the WDOG interrupt flag.

## Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

**76.2.4.8 static void WDOG\_HAL\_SetTimeoutValue ( WDOG\_Type \* *base*, uint32\_t *timeoutCount* ) [inline], [static]**

This function sets the WDOG\_TOVAL value. Ensure that the timeout value for the Watchdog is always greater than 2xWCT time + 20 bus clock cycles. Additionally, ensure that the WDOG registers are unlocked by the WDOG\_HAL\_Unlock, that the WCT window is still open, and that the WDOG\_STCTRLH register is not written in this WCT while this function is called. Make sure that the WDOG\_STCTRLH.ALLOWUPDATE is 1, which means that the register update is enabled.

## Parameters

|                     |                                                       |
|---------------------|-------------------------------------------------------|
| <i>base</i>         | The WDOG peripheral base address                      |
| <i>timeoutCount</i> | watchdog timeout value, count of watchdog clock tick. |

**76.2.4.9 static uint32\_t WDOG\_HAL\_GetTimerOutputValue ( WDOG\_Type \* *base* ) [inline], [static]**

This function gets the WDOG\_TMROUT value.

## Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

## Returns

Current value of watchdog timer counter.

**76.2.4.10 static void WDOG\_HAL\_SetWindowValue ( WDOG\_Type \* *base*, uint32\_t *windowValue* ) [inline], [static]**

This function sets the WDOG\_WIN value. Ensure that the WDOG registers are unlocked by the WDOG\_HAL\_Unlock, that the WCT window is still open, and that the WDOG\_STCTRLH register is not written in this WCT while this function is called. Additionally, ensure that the WDOG\_STCTRLH.ALLOWUPDATE is 1, which means that the register update is enabled.

## WDOG HAL driver

### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <i>base</i>        | The WDOG peripheral base address |
| <i>windowValue</i> | watchdog window value.           |

#### 76.2.4.11 **static void WDOG\_HAL\_Unlock ( WDOG\_Type \* *base* ) [inline], [static]**

This function unlocks the WDOG register written. This function must be called before any configuration is set because watchdog register is locked automatically after a WCT(256 bus cycles).

### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

#### 76.2.4.12 **static void WDOG\_HAL\_Refresh ( WDOG\_Type \* *base* ) [inline], [static]**

This function feeds the WDOG. This function should be called before watchdog timer is in timeout. Otherwise, a reset is asserted.

### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

#### 76.2.4.13 **static void WDOG\_HAL\_ResetSystem ( WDOG\_Type \* *base* ) [inline], [static]**

This function resets the chip using WDOG.

### Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

#### 76.2.4.14 **void WDOG\_HAL\_Init ( WDOG\_Type \* *base* )**

This function restores the WDOG module to reset value.

## Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>base</i> | The WDOG peripheral base address |
|-------------|----------------------------------|

## WDOG Peripheral driver

### 76.3 WDOG Peripheral driver

#### 76.3.1 Overview

This section describes the programming interface of the WDOG Peripheral driver. The WDOG driver configures and initializes the WDOG.

#### 76.3.2 WDOG Initialization

To initialize the WDOG module, call the [WDOG\\_DRV\\_Init\(\)](#) function and pass in the user configuration structure. This function automatically enables the WDOG module and clock.

After the [WDOG\\_DRV\\_Init\(\)](#) function is called, the WDOG is enabled and its counter is working. Therefore, the [WDOG\\_DRV\\_Refresh\(\)](#) function should be called before the WDOG times out.

This example code shows how to initialize and configure the driver:

```
// Define device configuration.
const wdog_user_config_t init =
{
 .clockSource = kWdogClockSourceLpoClock, // WDOG clock source is LPO clock //
 .clockPrescalerValue = kWdogClockPrescalerValueDevidel, // Clock prescaler divide by 1 //
 .timeoutValue = 2048, // Timeout count is 2048 //
 .interruptEnable = false, // Interrupt configure, false means disable interrupt //
 .updateRegisterEnable = true, // Enable WDOG register update after first configure //
 .workInWaitModeEnable = true, // Enable WDOG while CPU is in Wait mode //
 .workInStopModeEnable = true, // Enable WDOG while CPU is in Stop mode //
};

// Initialize WDOG.
WDOG_DRV_Init(&init);
```

#### 76.3.3 WDOG Refresh

After the WDOG is enabled, the [WDOG\\_DRV\\_Refresh\(\)](#) function should be called periodically to prevent the WDOG from timing out.

Otherwise, a reset is asserted. This is called "Feed Dog".

#### 76.3.4 WDOG Reset Count

The WDOG can record the reset count caused by the WDOG timeout.

1. [WDOG\\_DRV\\_GetResetCount\(\)](#) gets the reset count caused by the WDOG timeout.
2. [WDOG\\_DRV\\_ClearResetCount\(\)](#) clears the reset count caused by the WDOG timeout.

#### 76.3.5 WDOG Reset System

The WDOG can be used to reset the MCU.

1. `WDOG_DRV_ResetSystem()` resets the MCU whether the WDOG is enabled or not.

### 76.3.6 WDOG interrupt

If the WDOG interrupt is enabled, the WDOG asserts an interrupt and resets the system after 256 bus clock.

1. Enable the WDOG interrupt with the `wdog_user_config_t.interruptEnable = true`.
2. Define the WDOG IRQ function.

```
void Watchdog_IRQHandler()
{
 // Enter WDOG ISR //
}
```

### Watchdog Driver

Data structure for Watchdog initialization

This structure is used when initializing the WDOG during the `wdog_init` function call. It contains all WDOG configurations.

- `wdog_status_t WDOG_DRV_Init` (const `wdog_config_t *userConfigPtr`)  
*Initializes the Watchdog.*
- `wdog_status_t WDOG_DRV_Deinit` (void)  
*Shuts down the Watchdog.*
- void `WDOG_DRV_Refresh` (void)  
*Refreshes the Watchdog.*
- bool `WDOG_DRV_IsRunning` (void)  
*Gets the Watchdog running status.*
- void `WDOG_DRV_ResetSystem` (void)  
*Resets the MCU by using the Watchdog.*

### 76.3.7 Function Documentation

#### 76.3.7.1 `wdog_status_t WDOG_DRV_Init ( const wdog_config_t * userConfigPtr )`

This function initializes the WDOG. When called, the WDOG runs according to the requirements of the configuration.

Parameters

---

## WDOG Peripheral driver

|                      |                                                                  |
|----------------------|------------------------------------------------------------------|
| <i>userConfigPtr</i> | Watchdog user configure data structure, see #wdog_user_config_t. |
|----------------------|------------------------------------------------------------------|

Returns

kStatus\_WDOG\_Success means success. Otherwise, means failure.

### 76.3.7.2 wdog\_status\_t WDOG\_DRV\_Deinit ( void )

This function shuts down the WDOG.

Returns

kStatus\_WDOG\_Success means success. Otherwise, means failure.

### 76.3.7.3 void WDOG\_DRV\_Refresh ( void )

This function feeds the WDOG. It sets the WDOG timer count to zero and should be called before the Watchdog timer times out. Otherwise, a reset is asserted. Enough time should be allowed for the refresh sequence to be detected by the Watchdog timer on the Watchdog clock.

### 76.3.7.4 bool WDOG\_DRV\_IsRunning ( void )

This function gets the WDOG running status.

Returns

Watchdog running status, false means not running, true means running

### 76.3.7.5 void WDOG\_DRV\_ResetSystem ( void )

This function resets the MCU by using the WDOG.

---

## Chapter 77

# Inter-Peripheral Crossbar Switch (XBAR)

### 77.1 Overview

The Kinetis SDK provides both HAL and Peripheral drivers for the Inter-Peripheral Crossbar Switch (XBAR) block of Kinetis devices.

#### Modules

- [XBAR HAL driver](#)
- [XBAR Peripheral driver](#)

## XBAR HAL driver

### 77.2 XBAR HAL driver

#### 77.2.1 Overview

This section describes the programming interface of the XBAR HAL driver. This layer contains APIs for XBARA (XBAR in KM3x device case) and XBARB (if present) module.

#### Enumerations

- enum `xbar_active_edge_t` {  
`kXbarEdgeNone` = 0U,  
`kXbarEdgeRising` = 1U,  
`kXbarEdgeFalling` = 2U,  
`kXbarEdgeRisingAndFalling` = 3U }  
*XBAR active edge for detection.*
- enum `xbar_status_t` {  
`kStatus_XBAR_Success` = 0U,  
`kStatus_XBAR_InvalidArgument` = 1U,  
`kStatus_XBAR_Initialized` = 2U,  
`kStatus_XBAR_Failed` = 3U }  
*Defines XBAR status return codes.*

#### Functions

- void `XBARA_HAL_Init` (`XBARA_Type *baseAddr`)  
*Initializes the XBARA module to the reset state.*
- static void `XBARA_HAL_SetOutSel` (`XBARA_Type *baseAddr`, `uint32_t outIndex`, `uint32_t input`)  
*Selects which of the shared inputs `XBARA_IN[*]` is muxed to selected output `XBARA_OUT[*]`.*
- static `uint32_t XBARA_HAL_GetOutSel` (`XBARA_Type *baseAddr`, `uint32_t outIndex`)  
*Gets input `XBARA_IN[*]` muxed to selected output `XBARA_OUT[*]`.*
- static void `XBARA_HAL_SetDMAOutCmd` (`XBARA_Type *baseAddr`, `uint32_t outIndex`, `bool enable`)  
*Sets the DMA function on the corresponding `XBARA_OUT[*]` output.*
- static void `XBARA_HAL_SetIntOutCmd` (`XBARA_Type *baseAddr`, `uint32_t outIndex`, `bool enable`)  
*Sets the interrupt function on the corresponding `XBARA_OUT[*]` output.*
- static `bool XBARA_HAL_GetDMAOutCmd` (`XBARA_Type *baseAddr`, `uint32_t outIndex`)  
*Checks whether the DMA function is enabled or disabled on the corresponding `XBARA_OUT[*]` output.*
- static `bool XBARA_HAL_GetIntOutCmd` (`XBARA_Type *baseAddr`, `uint32_t outIndex`)  
*Checks whether the interrupt function is enabled or disabled on the corresponding `XBARA_OUT[*]` output.*
- static void `XBARA_HAL_SetOutActiveEdge` (`XBARA_Type *baseAddr`, `uint32_t outIndex`, `xbar_active_edge_t edge`)  
*Selects which edges on the corresponding `XBARA_OUT[*]` output cause STSn to assert.*

- static `xbar_active_edge_t XBARA_HAL_GetOutActiveEdge` (`XBARA_Type *baseAddr`, `uint32_t outIndex`)  
*Gets which edges on the corresponding XBARA\_OUT[\*] output cause STSn to assert.*
- static void `XBARA_HAL_ClearEdgeDetectionStatus` (`XBARA_Type *baseAddr`, `uint32_t outIndex`)  
*Clears the edge detection status for the corresponding XBARA\_OUT[\*] output.*
- static bool `XBARA_HAL_GetEdgeDetectionStatus` (`XBARA_Type *baseAddr`, `uint32_t outIndex`)  
*Gets the edge detection status for the corresponding XBARA\_OUT[\*] output.*
- void `XBARB_HAL_Init` (`XBARB_Type *baseAddr`)  
*Initializes the XBARB module to the reset state.*
- static void `XBARB_HAL_SetOutSel` (`XBARB_Type *baseAddr`, `uint32_t outIndex`, `uint32_t input`)  
*Selects which of the shared inputs XBARB\_IN[\*] is muxed to selected output XBARB\_OUT[\*].*
- static `uint32_t XBARB_HAL_GetOutSel` (`XBARB_Type *baseAddr`, `uint32_t outIndex`)  
*Gets input XBARB\_IN[\*] muxed to selected output XBARB\_OUT[\*].*

## 77.2.2 Enumeration Type Documentation

### 77.2.2.1 enum xbar\_active\_edge\_t

Enumerator

- kXbarEdgeNone*** Edge detection status bit never asserts.
- kXbarEdgeRising*** Edge detection status bit asserts on rising edges.
- kXbarEdgeFalling*** Edge detection status bit asserts on falling edges.
- kXbarEdgeRisingAndFalling*** Edge detection status bit asserts on rising and falling edges.

### 77.2.2.2 enum xbar\_status\_t

Enumerator

- kStatus\_XBAR\_Success*** Success.
- kStatus\_XBAR\_InvalidArgument*** Invalid argument existed.
- kStatus\_XBAR\_Initialized*** XBAR has been already initialized.
- kStatus\_XBAR\_Failed*** Execution failed.

## 77.2.3 Function Documentation

### 77.2.3.1 void XBARA\_HAL\_Init ( XBARA\_Type \* baseAddr )

## XBAR HAL driver

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>baseAddr</i> | Register base address for XBAR module. |
|-----------------|----------------------------------------|

### 77.2.3.2 `static void XBARA_HAL_SetOutSel ( XBARA_Type * baseAddr, uint32_t outIndex, uint32_t input ) [inline], [static]`

This function selects which of the shared inputs XBARA\_IN[\*] is muxed to selected output XBARA\_OUT[\*].

### Parameters

|                 |                                                    |
|-----------------|----------------------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module.            |
| <i>input</i>    | Input to be muxed to selected XBARA_OUT[*] output. |
| <i>outIndex</i> | Selected output XBARA_OUT[*].                      |

### 77.2.3.3 `static uint32_t XBARA_HAL_GetOutSel ( XBARA_Type * baseAddr, uint32_t outIndex ) [inline], [static]`

This function gets input XBARA\_IN[\*] muxed to selected output XBARA\_OUT[\*].

### Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>baseAddr</i> | Register base address for XBAR module. |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.          |

### Returns

Input XBARA\_IN[\*] muxed to selected XBARA\_OUT[\*] output.

### 77.2.3.4 `static void XBARA_HAL_SetDMAOutCmd ( XBARA_Type * baseAddr, uint32_t outIndex, bool enable ) [inline], [static]`

This function sets the DMA function on the corresponding XBARA\_OUT[\*]. When the interrupt is enabled, the output INT\_REQn reflects the value STSn. When the interrupt is disabled, INT\_REQn remains low. The interrupt request is cleared by writing a 1 to STSn.

## Parameters

|                 |                                               |
|-----------------|-----------------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module.       |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.                 |
| <i>enable</i>   | Bool value for enable or disable DMA request. |

**77.2.3.5 static void XBARA\_HAL\_SetIntOutCmd ( XBARA\_Type \* *baseAddr*, uint32\_t *outIndex*, bool *enable* ) [inline], [static]**

This function sets the interrupt function on the corresponding XBARA\_OUT[\*]. When enabled, DMA\_REQn presents the value STSn. When disabled, the DMA\_REQn output remains low.

## Parameters

|                 |                                             |
|-----------------|---------------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module.     |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.               |
| <i>enable</i>   | Bool value for enable or disable interrupt. |

**77.2.3.6 static bool XBARA\_HAL\_GetDMAOutCmd ( XBARA\_Type \* *baseAddr*, uint32\_t *outIndex* ) [inline], [static]**

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module. |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.           |

## Returns

DMA function is enabled (true) or disabled (false).

**77.2.3.7 static bool XBARA\_HAL\_GetIntOutCmd ( XBARA\_Type \* *baseAddr*, uint32\_t *outIndex* ) [inline], [static]**

## Parameters

## XBAR HAL driver

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module. |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.           |

Returns

Interrupt function is enabled (true) or disabled (false).

### 77.2.3.8 **static void XBARA\_HAL\_SetOutActiveEdge ( XBARA\_Type \* *baseAddr*, uint32\_t *outIndex*, xbar\_active\_edge\_t *edge* ) [inline], [static]**

This function selects which edges on the corresponding XBARA\_OUT[\*] output cause STSn to assert.

Parameters

|                 |                                        |
|-----------------|----------------------------------------|
| <i>baseAddr</i> | Register base address for XBAR module. |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.          |
| <i>edge</i>     | Active edge for edge detection.        |

### 77.2.3.9 **static xbar\_active\_edge\_t XBARA\_HAL\_GetOutActiveEdge ( XBARA\_Type \* *baseAddr*, uint32\_t *outIndex* ) [inline], [static]**

This function gets which edges on the corresponding XBARA\_OUT[\*] output cause STSn to assert.

Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module. |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.           |

Returns

Active edge for edge detection on corresponding XBARA\_OUT[\*] output.

### 77.2.3.10 **static void XBARA\_HAL\_ClearEdgeDetectionStatus ( XBARA\_Type \* *baseAddr*, uint32\_t *outIndex* ) [inline], [static]**

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module. |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.           |

**77.2.3.11 static bool XBARA\_HAL\_GetEdgeDetectionStatus ( XBARA\_Type \* *baseAddr*, uint32\_t *outIndex* ) [inline], [static]**

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>baseAddr</i> | Register base address for XBARA module. |
| <i>outIndex</i> | Selected XBARA_OUT[*] output.           |

## Returns

Active edge detected (true) or not yet detected (false) on correspondind XBARA\_OUT[\*] output.

**77.2.3.12 void XBARB\_HAL\_Init ( XBARB\_Type \* *baseAddr* )**

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>baseAddr</i> | Register base address for XBARB module. |
|-----------------|-----------------------------------------|

**77.2.3.13 static void XBARB\_HAL\_SetOutSel ( XBARB\_Type \* *baseAddr*, uint32\_t *outIndex*, uint32\_t *input* ) [inline], [static]**

This function selects which of the shared inputs XBARB\_IN[\*] is muxed to selected output XBARB\_OUT[\*]

## Parameters

|                 |                                                    |
|-----------------|----------------------------------------------------|
| <i>baseAddr</i> | Register base address for XBARB module.            |
| <i>outIndex</i> | Selected XBARB_OUT[*] output.                      |
| <i>input</i>    | Input to be muxed to selected XBARB_OUT[*] output. |

## XBAR HAL driver

**77.2.3.14** `static uint32_t XBARB_HAL_GetOutSel ( XBARB_Type * baseAddr, uint32_t outIndex ) [inline], [static]`

This function gets input XBARB\_IN[\*] muxed to selected output XBARB\_OUT[\*]

Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <i>baseAddr</i> | Register base address for XBARB module. |
| <i>outIndex</i> | Selected XBARB_OUT[*] output.           |

Returns

Input XBARB\_IN[\*] muxed to selected XBARB\_OUT[\*] output.

## 77.3 XBAR Peripheral driver

### 77.3.1 Overview

This section describes the programming interface of the XBAR Peripheral driver.

### 77.3.2 Overview

The XBAR peripheral driver configures the XBAR (Inter-Peripheral Crossbar Switch) and handles initialization and configuration of the XBAR module.

### 77.3.3 CMP Driver model building

XBAR driver has two parts:

- Signal connection - This part interconnects input and output signals.
- Active edge feature - Some of the outputs provides active edge detection. If an active edge occurs, an interrupt or a DMA request can be called. APIs handle user callbacks for the interrupts. The driver also includes API for clearing and reading status bit.

### 77.3.4 Initialization

To initialize the XBAR driver, a state structure has to be passed into the initialization function. This block of memory keeps pointers to user's callback functions and parameters to these functions. The XBAR module is initialized by calling the [XBAR\\_DRV\\_Init\(\)](#) function.

### 77.3.5 Call diagram

1. Call the "XBAR\_DRV\_Init()" function to initialize the XBAR module. A state structure of the "xbar\_state\_t" type has to be defined and passed into this function.
2. Optionally, call the "XBAR\_DRV\_ConfigOutControl()" function to set the active edge features, such interrupts or DMA requests. A configuration structure of the "xbar\_control\_config\_t" type is required.
3. Optionally, call the "XBAR\_DRV\_InstallCallback" function to install user's callback function. A pointer to the function of the "xbar\_callback\_t" type and pointer to a void parameter is required. When the XBAR is configured to enable the interrupt, the installed callback function is called after the interrupt event occurs.
4. Call the "XBAR\_DRV\_ConfigSignalConnection" function to connect the desired signals.
5. Finally, the XBAR works properly.

These are the examples to initialize and configure the XBAR driver for typical use cases.

Interrupt Mode:

## XBAR Peripheral driver

```
// xbat_test.c //

#include <stdio.h>
#include <stdlib.h>
#include "board.h"
#include "fsl_debug_console.h"
#include "fsl_xbar_driver.h"

void configure_xbar_test_pins(void);

/* User's callback function
void xbar_callback(void * param);

int main (void)
{
 hardware_init();
 dbg_uart_init();

 printf("XBAR PD TEST: Start...\r\n");

 configure_xbar_test_pins();

 xbar_state_t xbarStateStruct;

 /* Init the XBAR module
 XBAR_DRV_Init(&xbarStateStruct);

 uint32_t outIndex = 0;

 /* Configure an interrupt request on XBAR output 0 and install callback function
 xbar_control_config_t xbarConfigStruct;
 xbarConfigStruct.activeEdge = kXbarEdgeFalling;
 xbarConfigStruct.intDmaReq = kXbarReqIen;

 char msg[] = "The button is pressed";

 XBAR_DRV_ConfigOutControl(outIndex, &xbarConfigStruct);
 XBAR_DRV_InstallCallback(outIndex, xbar_callback, msg);

 /* Configure interperipheral signal connections.
 XBAR_DRV_ConfigSignalConnection(kXbaraInputXBAR_IN2, kXbaraOutputXB_OUT6);
 XBAR_DRV_ConfigSignalConnection(kXbaraInputXBAR_IN2, kXbaraOutputDMAreqOrInt);

 while(1);

 XBAR_DRV_Deinit();
 printf("XBAR PD Test ");
 printf("Succeed\r\n");
}

void xbar_callback(void * param){
 char * strin = (char *)param;
 printf("%s\n", strin);
}

void configure_xbar_test_pins(void){
 PORT_HAL_SetMuxMode(PORTF_BASE, 1u, kPortMuxAlt3);
 PORT_HAL_SetMuxMode(PORTD_BASE, 0u, kPortMuxAlt3);
}
```

### Polling Mode:

```
// xbar_test_polling.c //
```

```

#include <stdio.h>
#include <stdlib.h>
#include "board.h"
#include "fsl_debug_console.h"
#include "fsl_xbar_driver.h"

void configure_xbar_test_pins(void);

int main (void)
{
 hardware_init();
 dbg_uart_init();

 printf("XBAR PD TEST: Start...\r\n");

 configure_xbar_test_pins();

 xbar_state_t xbarStateStruct;

 /* Init the XBAR module
 XBAR_DRV_Init(&xbarStateStruct);

 uint32_t outIndex = 0;

 /* Configure an interrupt request on XBAR output 0
 xbar_control_config_t xbarConfigStruct;
 xbarConfigStruct.activeEdge = kXbarEdgeRising;
 xbarConfigStruct.intDmaReq = kXbarReqDis;
 XBAR_DRV_ConfigOutControl(outIndex, &xbarConfigStruct);

 /* Configure interperipheral signal connections.
 XBAR_DRV_ConfigSignalConnection(kXbaraInputXBAR_IN2, kXbaraOutputXB_OUT6);
 XBAR_DRV_ConfigSignalConnection(kXbaraInputXBAR_IN2, kXbaraOutputDMAreqOrInt);

 while(1)
 {
 if (XBAR_DRV_GetEdgeDetectionStatus(outIndex))
 {
 printf("The button is pressed\n");
 XBAR_DRV_ClearEdgeDetectionStatus(outIndex);
 }

 }

 XBAR_DRV_Deinit();
 printf("XBAR PD Test ");
 printf("Succeed\r\n");
}

void configure_xbar_test_pins(void){

 PORT_HAL_SetMuxMode(PORTF_BASE, 1u, kPortMuxAlt3);
 PORT_HAL_SetMuxMode(PORTD_BASE, 0u, kPortMuxAlt3);
}

```

## Data Structures

- struct [xbar\\_control\\_config\\_t](#)  
*Defines the configuration structure of the XBAR control register. [More...](#)*
- struct [xbar\\_state\\_t](#)  
*Internal driver state information. [More...](#)*

## XBAR Peripheral driver

### Macros

- #define [XBARA\\_MODULE](#) 0U  
*Macro defines XBARA module number.*
- #define [XBARB\\_MODULE](#) 1U  
*Macro defines XBARB module number.*

### Typedefs

- typedef void(\* [xbar\\_callback\\_t](#))(void \*param)  
*Defines the type of the user-defined callback function.*

### Enumerations

- enum [xbar\\_ien\\_den\\_req\\_t](#) {  
[kXbarReqDis](#) = 0U,  
[kXbarReqIen](#) = 1U,  
[kXbarReqDen](#) = 2U }  
*Defines the XBAR DMA and interrupt configurations.*

### Functions

- [xbar\\_status\\_t](#) [XBAR\\_DRV\\_Init](#) ([xbar\\_state\\_t](#) \*xbarStatePtr)  
*Initializes the XBAR modules.*
- void [XBAR\\_DRV\\_Deinit](#) (void)  
*Deinitializes the XBAR module.*
- [xbar\\_status\\_t](#) [XBAR\\_DRV\\_ConfigSignalConnection](#) ([xbar\\_input\\_signal\\_t](#) input, [xbar\\_output\\_signal\\_t](#) output)  
*Configures connection between the selected XBAR\_IN[\*] input and the XBAR\_OUT[\*] output signal.*
- [xbar\\_status\\_t](#) [XBAR\\_DRV\\_ConfigOutControl](#) (uint32\_t outIndex, const [xbar\\_control\\_config\\_t](#) \*controlConfigPtr)  
*Configures the XBAR control register.*
- bool [XBAR\\_DRV\\_GetEdgeDetectionStatus](#) (uint32\_t outIndex)  
*Gets the active edge detection status.*
- [xbar\\_status\\_t](#) [XBAR\\_DRV\\_ClearEdgeDetectionStatus](#) (uint32\_t outIndex)  
*Clears the status flag of the edge detection status flag for a desired XBAR\_OUT.*
- [xbar\\_status\\_t](#) [XBAR\\_DRV\\_InstallCallback](#) (uint32\_t outIndex, [xbar\\_callback\\_t](#) userCallback, void \*callbackParam)  
*Installs the callback function for the XBAR module.*
- void [XBAR\\_DRV\\_IRQHandler](#) (void)  
*Driver-defined ISR in the XBAR module.*

### Variables

- XBARA\_Type \*const [g\\_xbaraBase](#) []

- *Table of base addresses for XBAR instances.*
- `const IRQn_Type g_xbarIrqId []`  
*Table to save XBAR IRQ enumeration numbers defined in the CMSIS header file.*
- `xbar_active_edge_t xbar_control_config_t::activeEdge`  
*Active edge to be detected.*
- `xbar_ien_den_req_t xbar_control_config_t::intDmaReq`  
*Selects DMA/Interrupt request.*
- `xbar_callback_t xbar_state_t::userCallbackFunc` [FSL\_FEATURE\_XBARA\_INTERRUPT\_COUNT]  
*Keep the user-defined callback function.*
- `void * xbar_state_t::xbarCallbackParam` [FSL\_FEATURE\_XBARA\_INTERRUPT\_COUNT]  
*XBAR callback parameter pointer.*

## 77.3.6 Data Structure Documentation

### 77.3.6.1 struct xbar\_control\_config\_t

This structure keeps the configuration of XBAR control register for one output. Control registers are available only for a few outputs. Not every XBAR module has control registers.

#### Data Fields

- `xbar_active_edge_t activeEdge`  
*Active edge to be detected.*
- `xbar_ien_den_req_t intDmaReq`  
*Selects DMA/Interrupt request.*

### 77.3.6.2 struct xbar\_state\_t

The contents of this structure are internal to the driver and should not be modified by users.

#### Data Fields

- `xbar_callback_t userCallbackFunc` [FSL\_FEATURE\_XBARA\_INTERRUPT\_COUNT]  
*Keep the user-defined callback function.*
- `void * xbarCallbackParam` [FSL\_FEATURE\_XBARA\_INTERRUPT\_COUNT]  
*XBAR callback parameter pointer.*

## 77.3.7 Typedef Documentation

### 77.3.7.1 typedef void(\* xbar\_callback\_t)(void \*param)

A prototype for the callback function registered into the XBAR driver.

## XBAR Peripheral driver

### 77.3.8 Enumeration Type Documentation

#### 77.3.8.1 enum xbar\_ien\_den\_req\_t

Defines the XBAR DMA and interrupt configurations.

Enumerator

- kXbarReqDis* Interrupt and DMA are disabled.
- kXbarReqIen* Interrupt enabled, DMA disabled.
- kXbarReqDen* DMA enabled, interrupt disabled.

### 77.3.9 Function Documentation

#### 77.3.9.1 xbar\_status\_t XBAR\_DRV\_Init ( xbar\_state\_t \* xbarStatePtr )

This function initializes the XBAR module to a reset state.

Parameters

|                     |                    |
|---------------------|--------------------|
| <i>xbarStatePtr</i> | XBAR input signal. |
|---------------------|--------------------|

Returns

An error code or kStatus\_XBAR\_Success.

#### 77.3.9.2 void XBAR\_DRV\_Deinit ( void )

This function clears all configurations and shuts down the XBAR by disabling interrupt and the clock signal to the modules.

#### 77.3.9.3 xbar\_status\_t XBAR\_DRV\_ConfigSignalConnection ( xbar\_input\_signal\_t input, xbar\_output\_signal\_t output )

This function configures which XBAR input is connected to the selected XBAR output. If more than one XBAR module is available, only the inputs and outputs from the same module can be connected.

Example:

```
xbar_status_t status;

// Configure connection between XBARA_OUT16(CMP0) output and XBARA_IN1(VDD) input.
status = XBARA_HAL_ConfigSignalConnection(kXbaraInputVDD, kXbaraOutputCMP0);
switch (status)
{
 //...
}
```

**Parameters**

|               |                     |
|---------------|---------------------|
| <i>input</i>  | XBAR input signal.  |
| <i>output</i> | XBAR output signal. |

**Returns**

An error code or `kStatus_XBAR_Success`.

**77.3.9.4 `xbar_status_t XBAR_DRV_ConfigOutControl ( uint32_t outIndex, const xbar_control_config_t * controlConfigPtr )`**

This function configures an XBAR control register. The active edge detection and the DMA/IRQ function on the corresponding XBAR output can be set.

**Example:**

```
xbar_status_t status;

// Set the DMA function on XBAR_OUT2 to rising and falling active edges.
xbar_control_config_t controlOut2;

controlOut2.activeEdge = kXbarEdgeRisingAndFalling;
controlOut2.intDmaReq = kXbarReqDen;

status = XBAR_DRV_ConfigOutControl(2, controlOut2);
switch (status)
{
 //...
}
```

**Parameters**

|                         |                                                                    |
|-------------------------|--------------------------------------------------------------------|
| <i>outIndex</i>         | XBAR output number.                                                |
| <i>controlConfigPtr</i> | Pointer to structure that keeps configuration of control register. |

**Returns**

An error code or `kStatus_XBAR_Success`.

**77.3.9.5 `bool XBAR_DRV_GetEdgeDetectionStatus ( uint32_t outIndex )`**

This function gets the active edge detect status of the desired XBAR\_OUT. If the active edge occurs, the return value is asserted. When the interrupt or the DMA functionality is enabled for the XBAR\_OUTx, this field is 1 when the interrupt or DMA request is asserted and 0 when the interrupt or DMA request has been cleared.

## XBAR Peripheral driver

Parameters

|                 |                     |
|-----------------|---------------------|
| <i>outIndex</i> | XBAR output number. |
|-----------------|---------------------|

Returns

Assertion of edge detection status.

### 77.3.9.6 `xbar_status_t XBAR_DRV_ClearEdgeDetectionStatus ( uint32_t outIndex )`

This function clears the status flag of edge detection status flag of the XBAR\_OUTx.

Parameters

|                 |                     |
|-----------------|---------------------|
| <i>outIndex</i> | XBAR output number. |
|-----------------|---------------------|

Returns

An error code or `kStatus_XBAR_Success`.

### 77.3.9.7 `xbar_status_t XBAR_DRV_InstallCallback ( uint32_t outIndex, xbar_callback_t userCallback, void * callbackParam )`

This function installs the user-defined callback. When the XBAR interrupt request is configured, the callback is executed inside the ISR.

Parameters

|                      |                                      |
|----------------------|--------------------------------------|
| <i>outIndex</i>      | XBAR output number.                  |
| <i>userCallback</i>  | User-defined callback function.      |
| <i>callbackParam</i> | The XBAR callback parameter pointer. |

Returns

An error code or `kStatus_XBAR_Success`.

### 77.3.9.8 `void XBAR_DRV_IRQHandler ( void )`

This function is the driver-defined ISR in the XBAR module. It includes the process for interrupt mode defined by the driver. Currently, it is called inside the system-defined ISR.

### 77.3.10 Variable Documentation

77.3.10.1 XBARA\_Type\* const g\_xbaraBase[]

77.3.10.2 const IRQn\_Type g\_xbarIrqId[]

77.3.10.3 xbar\_active\_edge\_t xbar\_control\_config\_t::activeEdge

77.3.10.4 xbar\_ien\_den\_req\_t xbar\_control\_config\_t::intDmaReq

77.3.10.5 xbar\_callback\_t xbar\_state\_t::userCallbackFunc[FSL\_FEATURE\_XBARA\_INTERRUPT\_COUNT]

77.3.10.6 void\* xbar\_state\_t::xbarCallbackParam[FSL\_FEATURE\_XBARA\_INTERRUPT\_COUNT]

## 78 Revision History

This table summarizes revisions to this document.

**Table 1. Revision history**

| Revision number | Date    | Substantive changes                     |
|-----------------|---------|-----------------------------------------|
| 1               | 02/2016 | Revision 1 fixes chapter nesting issues |
