

# MWCT101xSF

## MWCT101XS Data Sheet

### Key Features

- Operating characteristics
  - Voltage range: 2.7 V to 5.5 V
  - Ambient temperature range: -40 °C to 105 °C for HSRUN mode, -40 °C to 125 °C for RUN mode
- Arm™ Cortex-M4F core, 32-bit CPU
  - Supports up to 112 MHz frequency (HSRUN) with 1.25 Dhrystone MIPS per MHz
  - Arm Core based on the Armv7 Architecture and Thumb@-2 ISA
  - Integrated Digital Signal Processor (DSP)
  - Configurable Nested Vectored Interrupt Controller (NVIC)
  - Single Precision Floating Point Unit (FPU)
- Clock interfaces
  - 4 - 40 MHz fast external oscillator (SOSC)
  - 48 MHz Fast Internal RC oscillator (FIRC)
  - 8 MHz Slow Internal RC oscillator (SIRC)
  - 128 kHz Low Power Oscillator (LPO)
  - Up to 112 MHz (HSRUN) System Phased Lock Loop (SPLL)
  - Up to 50 MHz DC external square wave input clock
  - Real Time Counter (RTC)
- Power management
  - Low-power Arm Cortex-M4F core with excellent energy efficiency
  - Power Management Controller (PMC) with multiple power modes: HSRUN, RUN, STOP, VLPR, and VLPS. Note: CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device will need to switch to RUN mode (80 Mhz) to execute CSEc (Security) or EEPROM writes/erase.
  - Clock gating and low power operation supported on specific peripherals.
- Memory and memory interfaces
  - Up to 2 MB program flash memory with ECC
  - 64 KB FlexNVM for data flash memory with ECC and EEPROM emulation. Note: CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device will need to switch to RUN mode (80 MHz) to execute CSEc (Security) or EEPROM writes/erase.
  - Up to 256 KB SRAM with ECC
  - Up to 4 KB of FlexRAM for use as SRAM or EEPROM emulation
  - Up to 4 KB Code cache to minimize performance impact of memory access latencies
  - QuadSPI with HyperBus™ support
- Mixed-signal analog
  - Up to two 12-bit Analog-to-Digital Converter (ADC) with up to 32 channel analog inputs per module
  - One Analog Comparator (CMP) with internal 8-bit Digital to Analog Converter (DAC)
- Debug functionality
  - Serial Wire JTAG Debug Port (SWJ-DP) combines Debug Watchpoint and Trace (DWT)
  - Instrumentation Trace Macrocell (ITM)
  - Test Port Interface Unit (TPIU)
  - Flash Patch and Breakpoint (FPB) Unit
- Human-machine interface (HMI)
  - Up to 89 GPIO pins with interrupt functionality
  - Non-Maskable Interrupt (NMI)

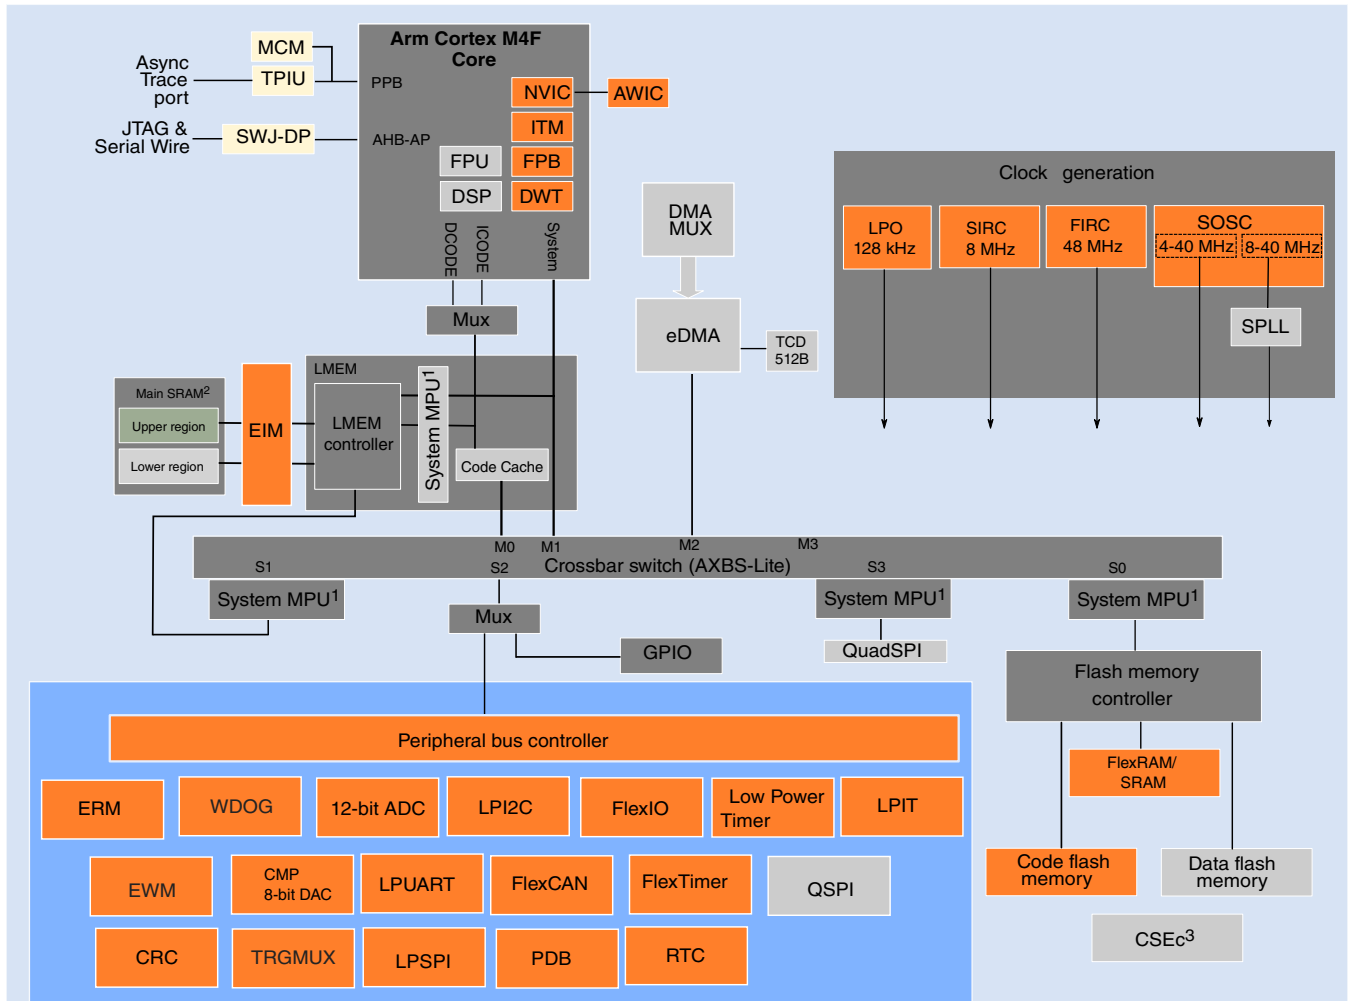

- Communications interfaces
  - Up to three Low Power Universal Asynchronous Receiver/Transmitter (LPUART/LIN) modules with DMA support and low power availability
  - Up to three Low Power Serial Peripheral Interface (LPSPI) modules with DMA support and low power availability
  - Up to two Low Power Inter-Integrated Circuit (LPI2C) modules with DMA support and low power availability
  - Up to three FlexCAN modules (with optional CAN-FD support)
  - FlexIO module for emulation of communication protocols and peripherals (UART, I2C, SPI, I2S, LIN, PWM, etc).
- Safety and Security
  - Cryptographic Services Engine (CSEc) implements a comprehensive set of cryptographic functions as described in the SHE (Secure Hardware Extension) Functional Specification. Note: CSEc (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device will need to switch to RUN mode (80 MHz) to execute CSEc (Security) or EEPROM writes/erase.
  - 128-bit Unique Identification (ID) number
  - Error-Correcting Code (ECC) on flash and SRAM memories
  - System Memory Protection Unit (System MPU)
  - Cyclic Redundancy Check (CRC) module
  - Internal watchdog (WDOG)
  - External Watchdog monitor (EWM) module
- Timing and control
  - Up eight independent 16-bit FlexTimers (FTM) module, offering up to 64 standard channels (IC/OC/PWM)
  - One 16-bit Low Power Timer (LPTMR) with flexible wake up control
  - Two Programmable Delay Blocks (PDB) with flexible trigger system
  - One 32-bit Low Power Interrupt Timer (LPIT) with 4 channels
  - 32-bit Real Time Counter (RTC)
- I/O and package
  - 64-pin LQFP, 100-pin LQFP, 100-pin MAPBGA package options
- 16 channel DMA with up to 63 request sources using DMAMUX

# 1 Block diagram

The figure below shows a superset high level architecture block diagram of the device. Other devices within the family have a subset of the features. See [Feature comparison](#) for chip specific values.

1: On this device, NXP's system MPU implements the safety mechanisms to prevent masters from accessing restricted memory regions. This system MPU provides memory protection at the level of the Crossbar Switch. Each Crossbar master (Core, DMA) can be assigned different access rights to each protected memory region. The Arm M4 core version in this family does not integrate the Arm Core MPU, which would concurrently monitor only core-initiated memory accesses. In this document, the term MPU refers to NXP's system MPU.

2: For the device-specific sizes, see the "On-chip SRAM sizes" table in the "Memories and Memory Interfaces" chapter of the MWCT101xS Series Reference Manual.

3: CSEC (Security) or EEPROM writes/erase will trigger error flags in HSRUN mode (112 MHz) because this use case is not allowed to execute simultaneously. The device needs to switch to RUN mode (80 MHz) to execute CSEC (Security) or EEPROM writes/erase.

Key:

- Device architectural IP on all MWCT101xS devices
- Peripherals present on all MWCT101xS devices
- Peripherals present on selected MWCT101xS devices (see the "Feature Comparison" section in the RM)

**Figure 1. High-level architecture diagram for the MWCT101xS family**

## 2 Feature comparison

The following figure summarizes the memory and package options for the MWCT101xS series and demonstrates where this device fits within the overall series. All devices which share a common package are pin-to-pin compatible.

### **NOTE**

Availability of peripherals depends on the pin availability in a particular package. For more information see IO Signal Description Input Multiplexing sheet(s) attached with Reference Manual.

## Feature comparison

		MWCT101xS		
Parameter		MWCT1014S	MWCT1015S	MWCT1016S
System	Core	Arm® Cortex™-M4F		
	Frequency	up to 112 MHz (HSRUN)		
	IEEE-754 FPU	●		
	HW security module (CSEc) <sup>1</sup>	● <sup>2</sup>		
	CRC module	1x		
	ISO 26262	capable up to ASIL-B		
	Peripheral speed	up to 112 MHz (HSRUN)		
	Crossbar	●		
	DMA	●		
	EWM	●		
	Memory protection unit	●		
	FIRC CMU	○		
	Watchdog	1x		
	Low power modes	●		
	HSRUN mode <sup>1</sup>	●		
	Number of I/Os	up to 89	up to 89	up to 89
	Single supply voltage	2.7 - 5.5 V		
Operating temperature (T <sub>a</sub> ) Temperature ambient	-40 to +105°C / +125°C			
Memory	Flash	512 KB	1 MB	2 MB <sup>3</sup>
	Error correction code (ECC)	●		
	System RAM (including FlexRAM)	64 KB	128 KB	256 KB
	FlexRAM (also available as system RAM)	4 KB		
	Cache	4 KB		
	EEPROM emulated by FlexRAM <sup>1</sup>	4 KB (up to 64 KB D-Flash)		See footnote 4
	External memory interface	○		QuadSPI incl. HyperBus™
Timer	Low power interrupt timer	1x		
	FlexTimer (16-bit counter) 8 channels	4x (32)	6x (48)	8x (64)
	Low power timer (LPTMR)	1x		
	Real time counter (RTC)	1x		
	Programmable delay block (PDB)	2x		
Analog	Trigger mux (TRGMUX)	1x (64)	1x (73)	1x (81)
	12-bit SAR ADC (1 MSPS each)	2x (16)	2x (24)	2x (32)
	Comparator with 8-bit DAC	1x		
Communication	Low power UART/LIN (Supports LIN protocol versions 1.3, 2.0, 2.1, 2.2A and SAE J2602)	3x		
	Low power SPI	3x		
	Low power I2C	1x		2x
	FlexCAN (CAN-FD ISO/CD 11898-1)	3x (1x with FD)	3x <sup>2</sup> (2x with FD)	3x (3x with FD)
	FlexIO (8 pins configurable as UART, SPI, I2C, I2S)	1x		
IDEs	Debug & trace	SWD, JTAG <sup>5</sup> (ITM, SWV, SWO)		SWD, JTAG (ITM, SWV, SWO), ETM
	Ecosystem (IDE, compiler, debugger)	NXP S32 Design Studio + GCC + GHS + Lauterbach		
Other	Packages <sup>6</sup>	LQFP-64 LQFP-100	LQFP-100 BGA-100	BGA-100

### LEGEND:

- Not implemented
- Available on the device
- <sup>1</sup> No write or erase access to Flash module, including Security (CSEc) and EEPROM commands, are allowed when device is running at HSRUN mode (112MHz) or VLPR mode.
- <sup>2</sup> Option with No CSEc and CAN-FD is also available for MWCT1015S
- <sup>3</sup> Available when EEPROM, CSEc and Data Flash are not used. Else only up to 1,984 KB is available for Program Flash.
- <sup>4</sup> 4 KB (up to 512 KB D-Flash as a part of 2M Flash). Up to 64 KB of flash is used as EEPROM backup and the remaining 448 KB of the last 512 KB block can be used as Data flash or Program flash. See chapter FTFC for details.
- <sup>5</sup> Only for Boundary Scan Register
- <sup>6</sup> See Dimensions for package drawing

## 3 Ordering parts

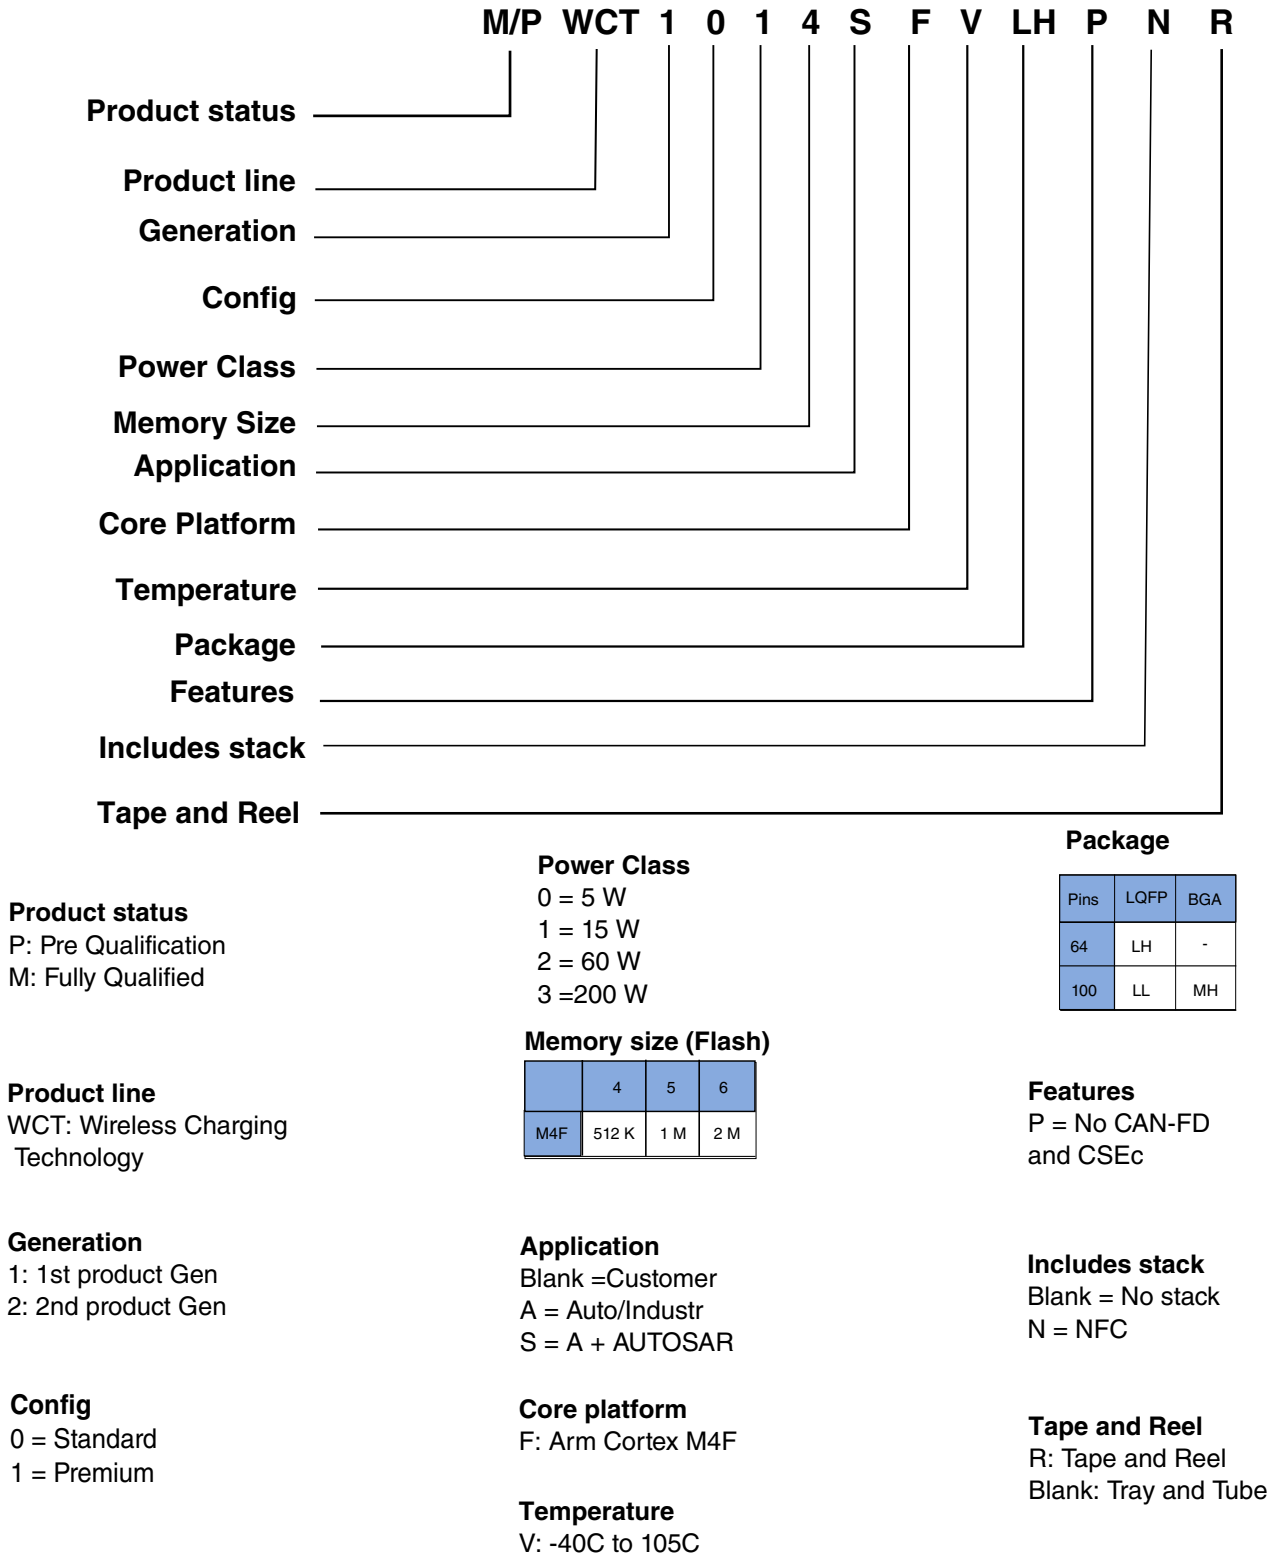

### 3.1 Determining valid orderable parts

To determine the orderable part numbers for this device, go to [www.nxp.com](http://www.nxp.com) and perform a part number search.

#### **NOTE**

Not all part number combinations exist

### 3.2 Ordering information

**Product status**  
 P: Pre Qualification  
 M: Fully Qualified

**Power Class**  
 0 = 5 W  
 1 = 15 W  
 2 = 60 W  
 3 =200 W

**Package**

Pins	LQFP	BGA
64	LH	-
100	LL	MH

**Product line**  
 WCT: Wireless Charging Technology

**Memory size (Flash)**

	4	5	6
M4F	512 K	1 M	2 M

**Features**  
 P = No CAN-FD and CSEc

**Generation**  
 1: 1st product Gen  
 2: 2nd product Gen

**Application**  
 Blank =Customer  
 A = Auto/Industr  
 S = A + AUTOSAR

**Includes stack**  
 Blank = No stack  
 N = NFC

**Config**  
 0 = Standard  
 1 = Premium

**Core platform**  
 F: Arm Cortex M4F

**Tape and Reel**  
 R: Tape and Reel  
 Blank: Tray and Tube

**Temperature**  
 V: -40C to 105C

**Figure 3. Ordering information**

## 4 General

### 4.1 Absolute maximum ratings

#### NOTE

- Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed. See footnotes in the following table for specific conditions.
- Stress beyond the listed maximum values may affect device reliability or cause permanent damage to the device.
- All the limits defined in the datasheet specification must be honored together and any violation to any one or more will not guarantee desired operation.
- Unless otherwise specified, all maximum and minimum values in the datasheet are across process, voltage, and temperature.

**Table 1. Absolute maximum ratings**

Symbol	Parameter	Conditions <sup>1</sup>	Min	Max	Unit
$V_{DD}$ <sup>2</sup>	2.7 V - 5.5 V input supply voltage	—	-0.3	5.8 <sup>3</sup>	V
$V_{REFH}$	3.3 V / 5.0 V ADC high reference voltage	—	-0.3	5.8 <sup>3</sup>	V
$I_{INJPAD\_DC\_ABS}$ <sup>4</sup>	Continuous DC input current (positive / negative) that can be injected into an I/O pin	—	-3	+3	mA
$V_{IN\_DC}$	Continuous DC Voltage on any I/O pin with respect to $V_{SS}$	—	-0.8	5.8 <sup>5</sup>	V
$I_{INJSUM\_DC\_ABS}$	Sum of absolute value of injected currents on all the pins (Continuous DC limit)	—	—	30	mA
$T_{ramp}$ <sup>6</sup>	ECU supply ramp rate	—	0.5 V/min	500 V/ms	—
$T_{ramp\_MCU}$ <sup>7</sup>	MCU supply ramp rate	—	0.5 V/min	100 V/ms	—
$T_A$ <sup>8</sup>	Ambient temperature	—	-40	125	°C
$T_{STG}$	Storage temperature	—	-55	165	°C
$V_{IN\_TRANSIENT}$	Transient overshoot voltage allowed on I/O pin beyond $V_{IN\_DC}$ limit	—	—	6.8 <sup>9</sup>	V

1. All voltages are referred to  $V_{SS}$  unless otherwise specified.
2. As  $V_{DD}$  varies between the minimum value and the absolute maximum value the analog characteristics of the I/O and the ADC will both change. See section [I/O parameters](#) and [ADC electrical specifications](#) respectively for details.
3. 60 s lifetime – No restrictions i.e. The part can switch.  
10 hours lifetime – Device in reset i.e. The part cannot switch.

## General

4. When input pad voltage levels are close to  $V_{DD}$  or  $V_{SS}$ , practically no current injection is possible.
5. While respecting the maximum current injection limit
6. This is the Electronic Control Unit (ECU) supply ramp rate and not directly the MCU ramp rate. Limit applies to both maximum absolute maximum ramp rate and typical operating conditions.
7. This is the MCU supply ramp rate, and the ramp rate assumes that the HW design guidelines in [AN5426](#) are followed. Limit applies to both maximum absolute maximum ramp rate and typical operating conditions.
8.  $T_J$  (Junction temperature)=135 °C. Assumes  $T_A$ =125 °C for RUN mode  
 $T_J$  (Junction temperature)=125 °C. Assumes  $T_A$ =105 °C for HSRUN mode
  - Assumes maximum  $\theta_{JA}$  for 2s2p board. See [Thermal characteristics](#)
9. 60 seconds lifetime; device in reset (no outputs enabled/toggling)

## 4.2 Voltage and current operating requirements

### NOTE

Device functionality is guaranteed up to the LVR assert level; however, electrical performance of 12-bit ADC, CMP with 8-bit DAC, IO electrical characteristics, and communication modules electrical characteristics would be degraded when voltage drops below 2.7 V

**Table 2. Voltage and current operating requirements 1**

Symbol	Description	Min.	Max.	Unit	Notes
$V_{DD}^2$	Supply voltage	2.7 <sup>3</sup>	5.5	V	4
$V_{DD\_OFF}$	Voltage allowed to be developed on $V_{DD}$ pin when it is not powered from any external power supply source.	0	0.1	V	
$V_{DDA}$	Analog supply voltage	2.7	5.5	V	4
$V_{DD} - V_{DDA}$	$V_{DD}$ -to- $V_{DDA}$ differential voltage	-0.1	0.1	V	4
$V_{REFH}$	ADC reference voltage high	2.7	$V_{DDA} + 0.1$	V	5
$V_{REFL}$	ADC reference voltage low	-0.1	0.1	V	
$V_{ODPU}$	Open drain pullup voltage level	$V_{DD}$	$V_{DD}$	V	6
$I_{INJPAD\_DC\_OP}^7$	Continuous DC input current (positive / negative) that can be injected into an I/O pin	-3	+3	mA	
$I_{INJSUM\_DC\_OP}$	Continuous total DC input current that can be injected across all I/O pins such that there's no degradation in accuracy of analog modules: ADC and ACMP (See section <a href="#">Analog Modules</a> )	—	30	mA	

1. Typical conditions assumes  $V_{DD} = V_{DDA} = V_{REFH} = 5$  V, temperature = 25 °C and typical silicon process unless otherwise stated.
2. As  $V_{DD}$  varies between the minimum value and the absolute maximum value the analog characteristics of the I/O and the ADC will both change. See section [I/O parameters](#) and [ADC electrical specifications](#) respectively for details.
3. MWCT1016S will operate from 2.7 V when executing from internal FIRC. When the PLL is engaged MWCT1016S is guaranteed to operate from 2.97 V. All other MWCT101xS family devices operate from 2.7 V in all modes.
4.  $V_{DD}$  and  $V_{DDA}$  must be shorted to a common source on PCB. The differential voltage between  $V_{DD}$  and  $V_{DDA}$  is for RF-AC only. Appropriate decoupling capacitors to be used to filter noise on the supplies. See application note [AN5032](#) for reference supply design for SAR ADC.

5.  $V_{REFH}$  should always be equal to or less than  $V_{DDA} + 0.1\text{ V}$  and  $V_{DD} + 0.1\text{ V}$
6. Open drain outputs must be pulled to  $V_{DD}$ .
7. When input pad voltage levels are close to  $V_{DD}$  or  $V_{SS}$ , practically no current injection is possible.

### 4.3 Thermal operating characteristics

**Table 3. Thermal operating characteristics for 64-pin LQFP and 100-pin LQFP and MAPBGA packages**

Symbol	Parameter	Value			Unit
		Min.	Typ.	Max.	
$T_A$ C-Grade Part	Ambient temperature under bias	-40	—	85 <sup>1</sup>	°C
$T_J$ C-Grade Part	Junction temperature under bias	-40	—	105 <sup>1</sup>	°C
$T_A$ V-Grade Part	Ambient temperature under bias	-40	—	105 <sup>1</sup>	°C
$T_J$ V-Grade Part	Junction temperature under bias	-40	—	125 <sup>1</sup>	°C
$T_A$ M-Grade Part	Ambient temperature under bias	-40	—	125 <sup>2</sup>	°C
$T_J$ M-Grade Part	Junction temperature under bias	-40	—	135 <sup>2</sup>	°C

1. Values mentioned are measured at  $\leq 112\text{ MHz}$  in HSRUN mode.
2. Values mentioned are measured at  $\leq 80\text{ MHz}$  in RUN mode.

### 4.4 Power and ground pins

NOTE:  $V_{DD}$  and  $V_{DDA}$  must be shorted to a common source on PCB

**Figure 4. Pinout decoupling**

**Table 4. Supplies decoupling capacitors 1, 2**

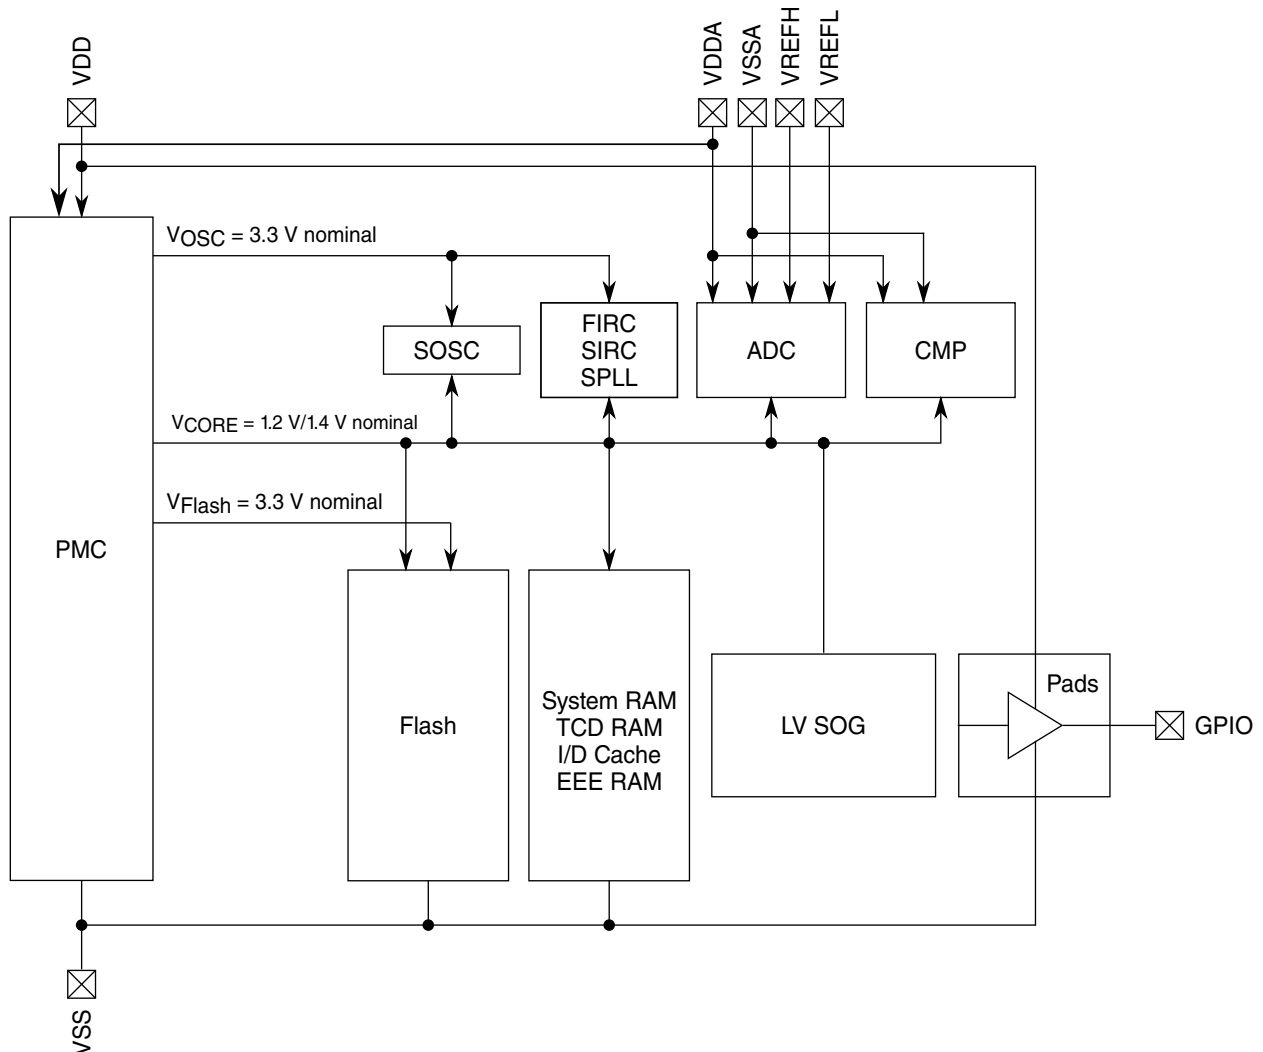

Symbol	Description	Min. <sup>3</sup>	Typ.	Max.	Unit
$C_{REF}$ <sup>4, 5</sup>	ADC reference high decoupling capacitance	70	100	—	nF

Table continues on the next page...

**Table 4. Supplies decoupling capacitors 1, 2 (continued)**

Symbol	Description	Min. <sup>3</sup>	Typ.	Max.	Unit
C <sub>DEC</sub> <sup>5, 6, 7</sup>	Recommended decoupling capacitance	70	100	—	nF

- V<sub>DD</sub> and V<sub>DDA</sub> must be shorted to a common source on PCB. The differential voltage between V<sub>DD</sub> and V<sub>DDA</sub> is for RF-AC only. Appropriate decoupling capacitors to be used to filter noise on the supplies. See application note [AN5032](#) for reference supply design for SAR ADC. All V<sub>SS</sub> pins should be connected to common ground at the PCB level.
- All decoupling capacitors must be low ESR ceramic capacitors (for example X7R type).
- Minimum recommendation is after considering component aging and tolerance.
- For improved performance, it is recommended to use 10 μF, 0.1 μF and 1 nF capacitors in parallel.
- All decoupling capacitors should be placed as close as possible to the corresponding supply and ground pins.
- Contact your local Field Applications Engineer for details on best analog routing practices.
- The filtering used for decoupling the device supplies must comply with the following best practices rules:
  - The protection/decoupling capacitors must be on the path of the trace connected to that component.
  - No trace exceeding 1 mm from the protection to the trace or to the ground.
  - The protection/decoupling capacitors must be as close as possible to the input pin of the device (maximum 2 mm).
  - The ground of the protection is connected as short as possible to the ground plane under the integrated circuit.

\*Note: VSSA and VSS are shorted at package level

**Figure 5. Power diagram**

## 4.5 LVR, LVD and POR operating requirements

Table 5.  $V_{DD}$  supply LVR, LVD and POR operating requirements

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
$V_{POR}$	Rising and falling $V_{DD}$ POR detect voltage	1.1	1.6	2.0	V	
$V_{LVR}$	LVR falling threshold (RUN, HSRUN, and STOP modes)	2.50	2.58	2.7	V	
$V_{LVR\_HYST}$	LVR hysteresis	—	45	—	mV	1
$V_{LVR\_LP}$	LVR falling threshold (VLPS/VLPR modes)	1.97	2.22	2.44	V	
$V_{LVD}$	Falling low-voltage detect threshold	2.8	2.875	3	V	
$V_{LVD\_HYST}$	LVD hysteresis	—	50	—	mV	1
$V_{LVW}$	Falling low-voltage warning threshold	4.19	4.305	4.5	V	
$V_{LVW\_HYST}$	LVW hysteresis	—	75	—	mV	1
$V_{BG}$	Bandgap voltage reference	0.97	1.00	1.03	V	

1. Rising threshold is the sum of falling threshold and hysteresis voltage.

## 4.6 Power mode transition operating behaviors

All specifications in the following table assume this clock configuration:

- RUN Mode:
  - Clock source: FIRC
  - SYS\_CLK/CORE\_CLK = 48 MHz
  - BUS\_CLK = 48 MHz
  - FLASH\_CLK = 24 MHz
- HSRUN Mode:
  - Clock source: SPLL
  - SYS\_CLK/CORE\_CLK = 112 MHz
  - BUS\_CLK = 56 MHz
  - FLASH\_CLK = 28 MHz
- VLPR Mode:
  - Clock source: SIRC
  - SYS\_CLK/CORE\_CLK = 4 MHz
  - BUS\_CLK = 4 MHz
  - FLASH\_CLK = 1 MHz
- STOP1/STOP2 Mode:
  - Clock source: FIRC
  - SYS\_CLK/CORE\_CLK = 48 MHz

- BUS\_CLK = 48 MHz
- FLASH\_CLK = 24 MHz
- VLPS Mode: All clock sources disabled.

**Table 6. Power mode transition operating behaviors**

Symbol	Description	Min.	Typ.	Max.	Unit
$t_{POR}$	After a POR event, amount of time from the point $V_{DD}$ reaches 2.7 V to execution of the first instruction across the operating temperature range of the chip.	—	325	—	$\mu s$
	VLPS → RUN	8	—	17	$\mu s$
	STOP1 → RUN	0.07	0.075	0.08	$\mu s$
	STOP2 → RUN	0.07	0.075	0.08	$\mu s$
	VLPR → RUN	19	—	26	$\mu s$
	VLPR → VLPS	5.1	5.7	6.5	$\mu s$
	VLPS → VLPR	18.8	23	27.75	$\mu s$
	RUN → Compute operation	0.72	0.75	0.77	$\mu s$
	HSRUN → Compute operation	0.3	0.31	0.35	$\mu s$
	RUN → STOP1	0.35	0.38	0.4	$\mu s$
	RUN → STOP2	0.2	0.23	0.25	$\mu s$
	RUN → VLPS	0.3	0.35	0.4	$\mu s$
	RUN → VLPR	3.5	3.8	5	$\mu s$
	VLPS → Asynchronous DMA Wakeup	105	110	125	$\mu s$
	STOP1 → Asynchronous DMA Wakeup	1	1.1	1.3	$\mu s$
	STOP2 → Asynchronous DMA Wakeup	1	1.1	1.3	$\mu s$
	Pin reset → Code execution	—	214	—	$\mu s$

**NOTE**

HSRUN should only be used when frequencies in excess of 80 MHz are required. When using 80 MHz and below, RUN mode is the recommended operating mode.

**4.7 Power consumption**

The following table shows the power consumption targets for the device in various modes of operation. Attached *MWCT101xS\_Power\_Modes\_Configuration.xlsx* details the modes used in gathering the power consumption data stated in the following table [Table 7](#). For full functionality refer to table: Module operation in available low power modes of the *Reference Manual*.

Table 7. Power consumption (Typicals unless stated otherwise) 1

Chip/Device	Ambient Temperature (°C)	VLPS (µA) <sup>2,3</sup>		VLPR (mA)		STOP1 (mA)	STOP2 (mA)	RUN@48 MHz (mA)		RUN@64 MHz (mA)		RUN@80 MHz (mA)		HSRUN@112 MHz (mA) <sup>4</sup>		Idd/MHz (µA/MHz) <sup>5</sup>

1. Typical current numbers are indicative for typical silicon process and may vary based on the silicon distribution and user configuration. Typical conditions assumes  $V_{DD} = V_{DDA} = V_{REFH} = 5V$ , temperature = 25 °C and typical silicon process unless otherwise stated. All output pins are floating and On-chip pull-down is enabled for all unused input pins.

## General

2. This is an average based on the use case described in the Comparator section, whereby the analog sampling is taking place periodically, with a mechanism to only enable the DAC as required. The numbers quoted assumes that only a single ANL\_CMP is active and the others are disabled
3. Current numbers are for reduced configuration and may vary based on user configuration and silicon process variation.
4. HSRUN mode must not be used at 125°C. Max ambient temperature for HSRUN mode is 105°C.
5. Values mentioned are measured at RUN@80 MHz with peripherals disabled.
6. With PMC\_REGSC[CLKBIASDIS] set to 1. See Reference Manual for details.
7. The MWCT1016S data points assume that QuadSPI etc. are inactive.

## 4.8 ESD handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
$V_{\text{HBM}}$	Electrostatic discharge voltage, human body model	- 4000	4000	V	1
$V_{\text{CDM}}$	Electrostatic discharge voltage, charged-device model				2
	All pins except the corner pins	- 500	500	V	
	Corner pins only	- 750	750	V	
$I_{\text{LAT}}$	Latch-up current at ambient temperature of 125 °C	- 100	100	mA	3

1. Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
2. Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.
3. Determined according to JEDEC Standard JESD78, *IC Latch-Up Test*.

## 4.9 EMC radiated emissions operating behaviors

EMC measurements to IC-level IEC standards are available from NXP on request.

## 5 I/O parameters

### 5.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

The midpoint is  $V_{\text{IL}} + (V_{\text{IH}} - V_{\text{IL}})/2$ .

**Figure 6. Input signal measurement reference**

## 5.2 General AC specifications

These general purpose specifications apply to all signals configured for GPIO, UART, and timers.

**Table 8. General switching specifications**

Symbol	Description	Min.	Max.	Unit	Notes
	GPIO pin interrupt pulse width (digital glitch filter disabled) — Synchronous path	1.5	—	Bus clock cycles	1, 2
	GPIO pin interrupt pulse width (digital glitch filter disabled, passive filter disabled) — Asynchronous path	50	—	ns	3
WFRST	$\overline{\text{RESET}}$ input filtered pulse	—	10	ns	4
WNFRST	$\overline{\text{RESET}}$ input not filtered pulse	Maximum of (100 ns, bus clock period)	—	ns	5

1. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In Stop and VLPS modes, the synchronizer is bypassed so shorter pulses can be recognized in that case.
2. The greater of synchronous and asynchronous timing must be met.
3. These pins do not have a passive filter on the inputs. This is the shortest pulse width that is guaranteed to be recognized.
4. Maximum length of  $\overline{\text{RESET}}$  pulse which will be filtered by internal filter.
5. Minimum length of  $\overline{\text{RESET}}$  pulse, guaranteed not to be filtered by the internal filter. This number depends on bus clock period also. For example, in VLPR mode bus clock is 4 MHz, which make clock period of 250 ns. In this case, minimum pulse width which will cause reset is 250 ns. For faster bus clock frequencies which have clock period less than 100 ns, the minimum pulse width not filtered will be 100 ns.

## 5.3 DC electrical specifications at 3.3 V Range

### NOTE

For details on the pad types defined in [Table 9](#) and [Table 10](#), see Reference Manual section *IO Signal Table* and IO Signal Description Input Multiplexing sheet(s) attached with Reference Manual.

**Table 9. DC electrical specifications at 3.3 V Range**

Symbol	Parameter	Value			Unit	Notes
		Min.	Typ.	Max.		
$V_{DD}$	I/O Supply Voltage	2.7	3.3	4	V	1
$V_{ih}$	Input Buffer High Voltage	$0.7 \times V_{DD}$	—	$V_{DD} + 0.3$	V	2
$V_{il}$	Input Buffer Low Voltage	$V_{SS} - 0.3$	—	$0.3 \times V_{DD}$	V	3
$V_{hys}$	Input Buffer Hysteresis	$0.06 \times V_{DD}$	—	—	V	
$I_{oh_{GPIO}}$	I/O current source capability measured when pad $V_{oh} = (V_{DD} - 0.8 \text{ V})$	3.5	—	—	mA	

Table continues on the next page...

**Table 9. DC electrical specifications at 3.3 V Range (continued)**

Symbol	Parameter	Value			Unit	Notes
		Min.	Typ.	Max.		
loh <sub>GPIO-HD_DSE_0</sub>						
lol <sub>GPIO</sub> lol <sub>GPIO-HD_DSE_0</sub>	I/O current sink capability measured when pad V <sub>ol</sub> = 0.8 V	3	—	—	mA	
loh <sub>GPIO-HD_DSE_1</sub>	I/O current source capability measured when pad V <sub>oh</sub> = (V <sub>DD</sub> – 0.8 V)	14	—	—	mA	4
lol <sub>GPIO-HD_DSE_1</sub>	I/O current sink capability measured when pad V <sub>ol</sub> = 0.8 V	12	—	—	mA	4
loh <sub>GPIO-FAST_DSE_0</sub>	I/O current sink capability measured when pad V <sub>oh</sub> =V <sub>DD</sub> -0.8 V	9.5	—	—	mA	5
lol <sub>GPIO-FAST_DSE_0</sub>	I/O current sink capability measured when pad V <sub>ol</sub> = 0.8 V	10	—	—	mA	5
loh <sub>GPIO-FAST_DSE_1</sub>	I/O current sink capability measured when pad V <sub>oh</sub> =V <sub>DD</sub> -0.8 V	16	—	—	mA	5
lol <sub>GPIO-FAST_DSE_1</sub>	I/O current sink capability measured when pad V <sub>ol</sub> = 0.8 V	15.5	—	—	mA	5
IOHT	Output high current total for all ports	—	—	100	mA	
IIN	Input leakage current (per pin) for full temperature range at V <sub>DD</sub> = 3.3 V		5	500 <sup>6</sup>	nA	7
	All pins other than high drive port pins		0.005	0.5	μA	
	High drive port pins		0.010	0.5	μA	
R <sub>PU</sub>	Internal pullup resistors	20		60	kΩ	8
R <sub>PD</sub>	Internal pulldown resistors	20		60	kΩ	9

- MWCT1016S will operate from 2.7 V when executing from internal FIRC. When the PLL is engaged MWCT1016S is guaranteed to operate from 2.97 V. All other MWCT101xS family devices operate from 2.7 V in all modes.
- For reset pads, same V<sub>ih</sub> levels are applicable
- For reset pads, same V<sub>il</sub> levels are applicable
- The value given is measured at high drive strength mode. For value at low drive strength mode see the loh\_Standard value given above.
- For reference only. Run simulations with the IBIS model and custom board for accurate results.
- Typical leakage is given at room temperature. Maximum is given for 125°C. Leakage numbers increase with temperature, approximately every 12 – 14°C the value doubles. Leakage is tested at hot temperature. We ensure maximums are not exceeded. Please note that when the ADC module samples a pin, additional currents beyond the leakage number are drawn to charge the sample and hold capacitances and internal analog busses. These are difficult to predict.
- Several I/O have both high drive and normal drive capability selected by the associated Portx\_PCRn[DSE] control bit. All other GPIOs are normal drive only. For details refer to MWCT101xS\_IO\_Signal\_Description\_Input\_Multiplexing.xlsx attached with the Reference Manual.
- Measured at input V = V<sub>SS</sub>
- Measured at input V = V<sub>DD</sub>

## 5.4 DC electrical specifications at 5.0 V Range

Table 10. DC electrical specifications at 5.0 V Range

Symbol	Parameter	Value			Unit	Notes
		Min.	Typ.	Max.		
$V_{DD}$	I/O Supply Voltage	4	—	5.5	V	
$V_{ih}$	Input Buffer High Voltage	$0.65 \times V_{DD}$	—	$V_{DD} + 0.3$	V	1
$V_{il}$	Input Buffer Low Voltage	$V_{SS} - 0.3$	—	$0.35 \times V_{DD}$	V	2
$V_{hys}$	Input Buffer Hysteresis	$0.06 \times V_{DD}$	—	—	V	
Ioh_Standard	I/O current source capability measured when pad $V_{oh} = (V_{DD} - 0.8 \text{ V})$	5	—	—	mA	
Iol_Standard	I/O current sink capability measured when pad $V_{ol} = 0.8 \text{ V}$	5	—	—	mA	
Ioh_Strong	I/O current source capability measured when pad $V_{oh} = V_{DD} - 0.8 \text{ V}$	20	—	—	mA	3, 4
Iol_Strong	I/O current sink capability measured when pad $V_{ol} = 0.8 \text{ V}$	20	—	—	mA	4, 5
IOHT	Output high current total for all ports	—	—	100	mA	
IIN	Input leakage current (per pin) for full temperature range at $V_{DD} = 3.3 \text{ V}$		5	500 <sup>6</sup>	nA	7
	All pins other than high drive port pins		0.005	0.5	$\mu\text{A}$	
	High drive port pins (excluding XTAL pin)		0.010	0.5	$\mu\text{A}$	
R <sub>PU</sub>	Internal pullup resistors	20		50	k $\Omega$	8
R <sub>PD</sub>	Internal pulldown resistors	20		50	k $\Omega$	9

- For reset pads, same  $V_{ih}$  levels are applicable
- For reset pads, same  $V_{il}$  levels are applicable
- The value given is measured at high drive strength mode. For value at low drive strength mode see the Ioh\_Standard value given above.
- The strong pad I/O pin is capable of switching a 50 pF load at up to 40 MHz.
- The value given is measured at high drive strength mode. For value at low drive strength mode see the Iol\_Standard value given above.
- Typical leakage is given at room temperature. Maximum is given for 125°C. Leakage numbers increase with temperature, approximately every 12 – 14°C the value doubles. Leakage is tested at hot temperature. We ensure maximums are not exceeded. Please note that when the ADC module samples a pin, additional currents beyond the leakage number are drawn to charge the sample and hold capacitances and internal analog busses. These are difficult to predict
- Several I/O have both high drive and normal drive capability selected by the associated Portx\_PCRn[DSE] control bit. All other GPIOs are normal drive only. For details refer to *MWCT101xS\_IO\_Signal\_Description\_Input\_Multiplexing.xlsx* attached with the *Reference Manual*.
- Measured at input  $V = V_{SS}$
- Measured at input  $V = V_{DD}$

## 5.5 AC electrical specifications at 3.3 V range

Table 11. AC electrical specifications at 3.3 V Range

Symbol	DSE	Rise time (nS) <sup>1</sup>		Fall time (nS) <sup>1</sup>		Capacitance (pF) <sup>2</sup>
		Min.	Max.	Min.	Max.	
tRF <sub>GPIO</sub>	NA	3.2	14.5	3.4	15.7	25
		5.7	23.7	6.0	26.2	50

tRF <sub>GPIO-FAST</sub>	0	0.42	2.2	0.37	2.2	25

Table continues on the next page...

**Table 12. AC electrical specifications at 5 V Range (continued)**

Symbol	DSE	Rise time (nS) <sup>1</sup>		Fall time (nS) <sup>1</sup>		Capacitance (pF) <sup>2</sup>
		Min.	Max .	Min.	Max.	
		2.0	5.0	1.9	5.2	50
		9.3	18.8	8.5	19.3	200
	1	0.37	0.9	0.35	0.9	25
		1.2	2.7	1.2	2.9	50
		6.0	11.8	6.0	12.3	200

1. For reference only. Run simulations with the IBIS model and your custom board for accurate results.
2. Maximum capacitances supported on Standard IOs. However interface or protocol specific specifications might be different, for example for QSPI etc. . For protocol specific AC specifications, see respective sections.

## 5.7 Standard input pin capacitance

**Table 13. Standard input pin capacitance**

Symbol	Description	Min.	Max.	Unit
C <sub>IN_D</sub>	Input capacitance: digital pins	—	7	pF

### NOTE

Please refer to [External System Oscillator electrical specifications](#) for EXTAL/XTAL pins.

## 5.8 Device clock specifications

**Table 14. Device clock specifications 1**

Symbol	Description	Min.	Max.	Unit
High Speed run mode <sup>2</sup>				
f <sub>SYS</sub>	System and core clock	—	112	MHz
f <sub>BUS</sub>	Bus clock	—	56	MHz
f <sub>FLASH</sub>	Flash clock	—	28	MHz
Normal run mode (MWCT101xS series) <sup>3</sup>				
f <sub>SYS</sub>	System and core clock	—	80	MHz
f <sub>BUS</sub>	Bus clock	—	40 <sup>4</sup>	MHz
f <sub>FLASH</sub>	Flash clock	—	26.67	MHz
VLPR mode <sup>5</sup>				
f <sub>SYS</sub>	System and core clock	—	4	MHz
f <sub>BUS</sub>	Bus clock	—	4	MHz
f <sub>FLASH</sub>	Flash clock	—	1	MHz
f <sub>ERCLK</sub>	External reference clock	—	16	MHz

1. Refer to the section [Feature comparison](#) for the availability of modes and other specifications.
2. Only available on some devices. See section [Feature comparison](#).
3. With SPLL as system clock source.
4. 48 MHz when  $f_{SYS}$  is 48 MHz
5. The frequency limitations in VLPR mode here override any frequency specification listed in the timing specification for any other module.

## 6 Peripheral operating requirements and behaviors

### 6.1 System modules

There are no electrical specifications necessary for the device's system modules.

### 6.2 Clock interface modules

#### 6.2.1 External System Oscillator electrical specifications

Figure 7. Oscillator connections scheme

Table 15. External System Oscillator electrical specifications

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
g <sub>mXOSC</sub>	Crystal oscillator transconductance					
	4-8 MHz	2.2	—	13.7	mA/V	
	8-40 MHz	16	—	47	mA/V	
V <sub>IL</sub>	Input low voltage — EXTAL pin in external clock mode	V <sub>SS</sub>	—	0.35 * V <sub>DD</sub>	V	
V <sub>IH</sub>	Input high voltage — EXTAL pin in external clock mode	0.7 * V <sub>DD</sub>	—	V <sub>DD</sub>	V	
C <sub>1</sub>	EXTAL load capacitance	—	—	—		1
C <sub>2</sub>	XTAL load capacitance	—	—	—		1
R <sub>F</sub>	Feedback resistor					2
	Low-gain mode (HGO=0)	—	—	—	MΩ	

Table continues on the next page...

**Table 15. External System Oscillator electrical specifications (continued)**

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
	High-gain mode (HGO=1)	—	1	—	MΩ	
R <sub>S</sub>	Series resistor					
	Low-gain mode (HGO=0)	—	0	—	kΩ	
	High-gain mode (HGO=1)	—	0	—	kΩ	
V <sub>pp</sub>	Peak-to-peak amplitude of oscillation (oscillator mode)					3
	Low-gain mode (HGO=0)	—	1.0	—	V	
	High-gain mode (HGO=1)	—	3.3	—	V	

1. Crystal oscillator circuit provides stable oscillations when  $g_{mXOSC} > 5 * gm\_crit$ . The  $gm\_crit$  is defined as:

$$gm\_crit = 4 * ESR * (2\pi F)^2 * (C_0 + C_L)^2$$

where:

- $g_{mXOSC}$  is the transconductance of the internal oscillator circuit
- ESR is the equivalent series resistance of the external crystal
- F is the external crystal oscillation frequency
- $C_0$  is the shunt capacitance of the external crystal
- $C_L$  is the external crystal total load capacitance.  $C_L = C_s + [C_1 * C_2 / (C_1 + C_2)]$
- $C_s$  is stray or parasitic capacitance on the pin due to any PCB traces
- $C_1, C_2$  external load capacitances on EXTAL and XTAL pins

See manufacture datasheet for external crystal component values

2.
  - When low-gain is selected, internal R<sub>F</sub> will be selected and external R<sub>F</sub> should not be attached.
  - When high-gain is selected, external R<sub>F</sub> (1 M Ohm) needs to be connected for proper operation of the crystal. For external resistor, up to 5% tolerance is allowed.
3. The EXTAL and XTAL pins should only be connected to required oscillator components and must not be connected to any other devices.

## 6.2.2 External System Oscillator frequency specifications

**Table 16. External System Oscillator frequency specifications**

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
f <sub>osc_hi</sub>	Oscillator crystal or resonator frequency	4	—	40	MHz	
f <sub>ec_extal</sub>	Input clock frequency (external clock mode)	—	—	50	MHz	1
t <sub>dc_extal</sub>	Input clock duty cycle (external clock mode)	48	50	52	%	1
t <sub>cst</sub>	Crystal Start-up Time					2
	8 MHz low-gain mode (HGO=0)	—	1.5	—	ms	
	8 MHz high-gain mode (HGO=1)	—	2.5	—		
	40 MHz low-gain mode (HGO=0)	—	2	—		
	40 MHz high-gain mode (HGO=1)	—	2	—		

1. Frequencies below 40 MHz can be used for degraded duty cycle up to 40-60%
2. Proper PC board layout procedures must be followed to achieve specifications.

## 6.2.3 System Clock Generation (SCG) specifications

### 6.2.3.1 Fast internal RC Oscillator (FIRC) electrical specifications

Table 17. Fast internal RC Oscillator electrical specifications

Symbol	Parameter <sup>1</sup>	Value			Unit
		Min.	Typ.	Max.	
$F_{\text{FIRC}}$	FIRC target frequency	—	48	—	MHz
$\Delta F$	Frequency deviation across process, voltage, and temperature < 105°C	—	±0.5	±1	% $F_{\text{FIRC}}$
$\Delta F_{125}$	Frequency deviation across process, voltage, and temperature < 125°C	—	±0.5	±1.1	% $F_{\text{FIRC}}$
$T_{\text{Startup}}$	Startup time		3.4	5	$\mu\text{s}^2$
$T_{\text{JIT}}^3$	Cycle-to-Cycle jitter	—	250	500	ps
$T_{\text{JIT}}^3$	Long term jitter over 1000 cycles	—	0.04	0.1	% $F_{\text{FIRC}}$

1. With FIRC regulator enable
2. Startup time is defined as the time between clock enablement and clock availability for system use.
3. FIRC as system clock

#### NOTE

Fast internal RC Oscillator is compliant with CAN and LIN standards.

### 6.2.3.2 Slow internal RC oscillator (SIRC) electrical specifications

Table 18. Slow internal RC oscillator (SIRC) electrical specifications

Symbol	Parameter	Value			Unit
		Min.	Typ.	Max.	
$F_{\text{SIRC}}$	SIRC target frequency	—	8	—	MHz
$\Delta F$	Frequency deviation across process, voltage, and temperature < 105°C	—	—	±3	% $F_{\text{SIRC}}$
$\Delta F_{125}$	Frequency deviation across process, voltage, and temperature < 125°C	—	—	±3.3	% $F_{\text{SIRC}}$
$T_{\text{Startup}}$	Startup time	—	9	12.5	$\mu\text{s}^1$

1. Startup time is defined as the time between clock enablement and clock availability for system use.

## 6.2.4 Low Power Oscillator (LPO) electrical specifications

Table 19. Low Power Oscillator (LPO) electrical specifications

Symbol	Parameter	Min.	Typ.	Max.	Unit
F <sub>LPO</sub>	Internal low power oscillator frequency	113	128	139	kHz
T <sub>startup</sub>	Startup Time	—	—	20	μs

## 6.2.5 SPLL electrical specifications

Table 20. SPLL electrical specifications

Symbol	Parameter	Min.	Typ.	Max.	Unit
F <sub>SPLL_REF</sub> <sup>1</sup>	PLL Reference Frequency Range	8	—	16	MHz
F <sub>SPLL_Input</sub> <sup>2</sup>	PLL Input Frequency	8	—	40	MHz
F <sub>VCO_CLK</sub>	VCO output frequency	180	—	320	MHz
F <sub>SPLL_CLK</sub>	PLL output frequency	90	—	160	MHz
J <sub>CYC_SPLL</sub>	PLL Period Jitter (RMS) <sup>3</sup>				
	at F <sub>VCO_CLK</sub> 180 MHz	—	120	—	ps
	at F <sub>VCO_CLK</sub> 320 MHz	—	75	—	ps
J <sub>ACC_SPLL</sub>	PLL accumulated jitter over 1μs (RMS) <sup>3</sup>				
	at F <sub>VCO_CLK</sub> 180 MHz	—	—	1350	ps
	at F <sub>VCO_CLK</sub> 320 MHz	—	—	600	ps
D <sub>UNL</sub>	Lock exit frequency tolerance	± 4.47	—	± 5.97	%
T <sub>SPLL_LOCK</sub>	Lock detector detection time <sup>4</sup>	—	—	150 × 10 <sup>-6</sup> + 1075(1/F <sub>SPLL_REF</sub> )	s

1. F<sub>SPLL\_REF</sub> is PLL reference frequency range after the PREDIV. For PREDIV and MULT settings refer SCG\_SPLLCFG register of Reference Manual.
2. F<sub>SPLL\_Input</sub> is PLL input frequency range before the PREDIV must be limited to the range 8 MHz to 40 MHz. This input source could be derived from a crystal oscillator or some other external square wave clock source using OSC bypass mode. For external clock source settings refer SCG\_SOSCCFG register of Reference Manual.
3. This specification was obtained using a NXP developed PCB. PLL jitter is dependent on the noise characteristics of each PCB and results will vary
4. Lock detector detection time is defined as the time between PLL enablement and clock availability for system use.

## 6.3 Memory and memory interfaces

### 6.3.1 Flash memory module (FTFC) electrical specifications

This section describes the electrical characteristics of the flash memory module.

## 6.3.1.1 Flash timing specifications — commands

Table 21. Flash command timing specifications

Symbol	Description <sup>1</sup>		MWCT1014S		MWCT1015S		MWCT1016S		Unit	Notes
			Typ	Max	Typ	Max	Typ	Max		
t <sub>rd1blk</sub>	Read 1 Block execution time	32 KB flash	—	—	—	—	—	—	ms	
		64 KB flash	—	0.5	—	0.5	—	—

		64 KB EEPROM backup	810	2250	810	2250	810	4500		
t <sub>quickwr</sub>	32-bit Quick Write execution time: Time from CCIF clearing (start the write) until CCIF setting (32-bit write	1st 32-bit write	200	550	200	550	200	1100	μs	4·5·6
		2nd through Next to Last (Nth-1) 32-bit write	150	550	150	550	150	550		

Table continues on the next page...

**Table 21. Flash command timing specifications (continued)**

Symbol	Description <sup>1</sup>		MWCT1014S		MWCT1015S		MWCT1016S		Unit	Notes
			Typ	Max	Typ	Max	Typ	Max		
	complete, ready for next 32-bit write)	Last (Nth) 32-bit write (time for write only, not cleanup)	200	550	200	550	200	550		
$t_{\text{quickwrClnup}}$	Quick Write Cleanup execution time	—	—	(# of Quick Writes ) * 2.0	—	(# of Quick Writes ) * 2.0	—	(# of Quick Writes ) * 2.0	ms	7

1. All command times assumes 25 MHz or greater flash clock frequency (for synchronization time between internal/external clocks).
2. Maximum times for erase parameters based on expectations at cycling end-of-life.
3. For all EEPROM Emulation terms, the specified timing shown assumes previous record cleanup has occurred. This may be verified by executing FCCOB Command 0x77, and checking FCCOB number 5 contents show 0x00 - No EEPROM issues detected.
4. 1st time EERAM writes after a Reset or SETRAM may incur additional overhead for EEE cleanup, resulting in up to 2x the times shown.
5. Only after the Nth write completes will any data be valid. Emulated EEPROM record scheme cleanup overhead may occur after this point even after a brownout or reset. If power on reset occurs before the Nth write completes, the last valid record set will still be valid and the new records will be discarded.
6. Quick Write times may take up to 550  $\mu$ s, as additional cleanup may occur when crossing sector boundaries.
7. Time for emulated EEPROM record scheme overhead cleanup. Automatically done after last (Nth) write completes, assuming still powered. Or via SETRAM cleanup execution command is requested at a later point.

**NOTE**

Under certain circumstances FlexMEM maximum times may be exceeded. In this case the user or application may wait, or assert reset to the FTFC macro to stop the operation.

**6.3.1.2 Reliability specifications****Table 22. NVM reliability specifications**

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
When using as Program and Data Flash						
$t_{\text{nmwrep1k}}$	Data retention after up to 1 K cycles	20	—	—	years	1
$\eta_{\text{nmwrcyc}}$	Cycling endurance	1 K	—	—	cycles	2, 3
When using FlexMemory feature: FlexRAM as Emulated EEPROM						
$t_{\text{nmwretee}}$	Data retention	5	—	—	years	4
$\eta_{\text{nmwree16}}$	Write endurance	100 K	—	—	writes	5, 6, 7
$\eta_{\text{nmwree256}}$	• EEPROM backup to FlexRAM ratio = 16 • EEPROM backup to FlexRAM ratio = 256	1.6 M	—	—	writes	

1. Data retention period per block begins upon initial user factory programming or after each subsequent erase.
2. Program and Erase for PFlash and DFlash are supported across product temperature specification in Normal Mode (not supported in HSRUN mode).
3. Cycling endurance is per DFlash or PFlash Sector.
4. Data retention period per block begins upon initial user factory programming or after each subsequent erase. Background maintenance operations during normal FlexRAM usage extend effective data retention life beyond 5 years.

5. FlexMemory write endurance specified for 16-bit and/or 32-bit writes to FlexRAM and is supported across product temperature specification in Normal Mode (not supported in HSRUN mode). Greater write endurance may be achieved with larger ratios of EEPROM backup to FlexRAM.
6. For usage of any EEE driver other than the FlexMemory feature, the endurance spec will fall back to the specified endurance value of the D-Flash specification (1K).
7. [FlexMemory calculator tool](#) is available at NXP web site for help in estimation of the maximum write endurance achievable at specific EEPROM/FlexRAM ratios. The “In Spec” portions of the online calculator refer to the NVM reliability specifications section of data sheet. This calculator is only applies to the FlexMemory feature.

### 6.3.2 QuadSPI AC specifications

The following table describes the QuadSPI electrical characteristics.

- Measurements are with maximum output load of 25 pF, input transition of 1 ns and pad configured with fastest slew settings (DSE = 1'b1).
- I/O operating voltage ranges from 2.97 V to 3.6 V
- While doing the mode transition (RUN -> HSRUN or HSRUN -> RUN ), the interface should be OFF.
- Add 50 ohm series termination on board in QuadSPI SCK for Flash A to avoid loop back reflection when using in Internal DQS (PAD Loopback) mode.
- QuadSPI trace length should be 3 inches.
- For non-Quad mode of operation if external device doesn't have pull-up feature, external pull-up needs to be added at board level for non-used pads.
- With external pull-up, performance of the interface may degrade based on load associated with external pull-up.

Table 23. QuadSPI electrical specifications

## 6.4 Analog modules

### 6.4.1 ADC electrical specifications

#### 6.4.1.1 12-bit ADC operating conditions

Table 24. 12-bit ADC operating conditions

Symbol	Description	Conditions	Min.	Typ. <sup>1</sup>	Max.	Unit	Notes
$V_{REFH}$	ADC reference voltage high		See <a href="#">Voltage and current operating requirements</a> for values	$V_{DDA}$	See <a href="#">Voltage and current operating requirements</a> for values	V	2
$V_{REFL}$	ADC reference voltage low		See <a href="#">Voltage and current operating requirements</a> for values	0	See <a href="#">Voltage and current operating requirements</a> for values	mV	2
$V_{ADIN}$	Input voltage		$V_{REFL}$	—	$V_{REFH}$	V	
$R_S$	Source impedence	$f_{ADCK} < 4$ MHz	—	—	5	k $\Omega$	
$R_{SW1}$	Channel Selection Switch Impedance		—	0.65	0.78	k $\Omega$	
$R_{AD}$	Sampling Switch Impedance		—	0.155	1	k $\Omega$	
$C_{P1}$	Pin Capacitance		—	2.1	2.5	pF	
$C_{P2}$	Analog Bus Capacitance		—	3	4	pF	

Table continues on the next page...

**Table 24. 12-bit ADC operating conditions (continued)**

Symbol	Description	Conditions	Min.	Typ. <sup>1</sup>	Max.	Unit	Notes
C <sub>S</sub>	Sampling capacitance		—	5.1 (gain = 0)..7.2 (gain = max)	6.36 (gain = 0)..9.36 (gain = max)	pF	
f <sub>ADCK</sub>	ADC conversion clock frequency	Normal usage	2	40	50	MHz	3, 4
f <sub>CONV</sub>	ADC conversion frequency	No ADC hardware averaging. <sup>5</sup> Continuous conversions enabled, subsequent conversion time	46.4	928	1160	Ksps	6, 7
		ADC hardware averaging set to 32. <sup>5</sup> Continuous conversions enabled, subsequent conversion time	1.45	29	36.25	Ksps	6, 7

1. Typical values assume V<sub>DDA</sub> = 5 V, Temp = 25 °C, f<sub>ADCK</sub> = 40 MHz, R<sub>AS</sub>=20 Ω, and C<sub>AS</sub>=10 nF unless otherwise stated. Typical values are for reference only, and are not tested in production.
2. For packages without dedicated V<sub>REFH</sub> and V<sub>REFL</sub> pins, V<sub>REFH</sub> is internally tied to V<sub>DDA</sub>, and V<sub>REFL</sub> is internally tied to V<sub>SS</sub>. To get maximum performance, reference supply quality should be better than SAR ADC. See application note [AN5032](#) for details.
3. Clock and compare cycle need to be set according to the guidelines mentioned in the *Reference Manual* .
4. ADC conversion will become less reliable above maximum frequency.
5. When using ADC hardware averaging, see the *Reference Manual* to determine the most appropriate setting for AVGS.
6. Numbers based on the minimum sampling time of 275 ns.
7. For guidelines and examples of conversion rate calculation, see the *Reference Manual* or download the ADC calculator tool.

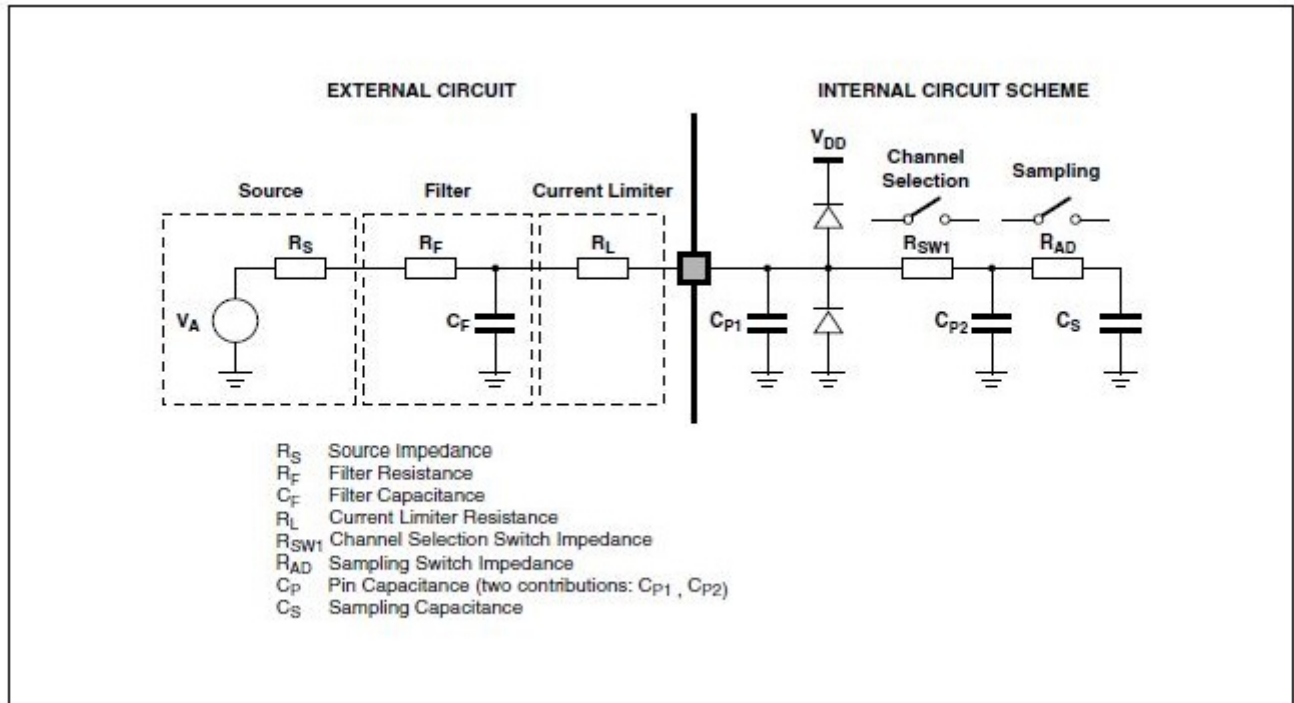

Figure 12. ADC input impedance equivalency diagram

### 6.4.1.2 12-bit ADC electrical characteristics

#### NOTE

- ADC performance specifications are documented using a single ADC. For parallel/simultaneous operation of both ADCs, either for sampling the same channel by both ADCs or for sampling different channels by each ADC, some amount of decrease in performance can be expected. Care must be taken to stagger the two ADC conversions, in particular the sample phase, to minimize the impact of simultaneous conversions.
- On reduced pin packages where ADC reference pins are shared with supply pins, ADC analog performance characteristics may be impacted. The amount of variation will be directly impacted by the external PCB layout and hence care must be taken with PCB routing. See [AN5426](#) for details

Table 25. 12-bit ADC characteristics (2.7 V to 3 V) ( $V_{REFH} = V_{DDA}$ ,  $V_{REFL} = V_{SS}$ )

Symbol	Description	Conditions <sup>1</sup>	Min.	Typ. <sup>2</sup>	Max.	Unit	Notes
$V_{DDA}$	Supply voltage		2.7	—	3	V	

Table continues on the next page...

**Table 25. 12-bit ADC characteristics (2.7 V to 3 V) ( $V_{REFH} = V_{DDA}$ ,  $V_{REFL} = V_{SS}$ ) (continued)**

Symbol	Description	Conditions <sup>1</sup>	Min.	Typ. <sup>2</sup>	Max.	Unit	Notes
I <sub>DDA_ADC</sub>	Supply current per ADC		—	0.6	—	mA	3
SMPLTS	Sample Time		275	—	Refer to the <i>Reference Manual</i>	ns	
TUE <sup>4</sup>	Total unadjusted error		—	±4	±8	LSB <sup>5</sup>	6, 7, 8, 9
DNL	Differential non-linearity		—	±1.0	—	LSB <sup>5</sup>	6, 7, 8, 9
INL	Integral non-linearity		—	±2.0	—	LSB <sup>5</sup>	6, 7, 8, 9

1. All accuracy numbers assume the ADC is calibrated with  $V_{REFH}=V_{DDA}=V_{DD}$ , with the calibration frequency set to less than or equal to half of the maximum specified ADC clock frequency.
2. Typical values assume  $V_{DDA} = 3\text{ V}$ ,  $\text{Temp} = 25\text{ }^{\circ}\text{C}$ ,  $f_{ADCK} = 40\text{ MHz}$ ,  $R_{AS}=20\ \Omega$ , and  $C_{AS}=10\text{ nF}$ .
3. The ADC supply current depends on the ADC conversion rate.
4. Represents total static error, which includes offset and full scale error.
5.  $1\text{ LSB} = (V_{REFH} - V_{REFL})/2^N$
6. The specifications are with averaging and in standalone mode only. Performance may degrade depending upon device use case scenario. When using ADC averaging, refer to the *Reference Manual* to determine the most appropriate settings for AVGS.
7. For ADC signals adjacent to  $V_{DD}/V_{SS}$  or XTAL/EXTAL or high frequency switching pins, some degradation in the ADC performance may be observed.
8. All values guarantee the performance of the ADC for multiple ADC input channel pins. When using ADC to monitor the internal analog parameters, assume minor degradation.
9. All the parameters in the table are given assuming system clock as the clocking source for ADC.

**Table 26. 12-bit ADC characteristics (3 V to 5.5 V)( $V_{REFH} = V_{DDA}$ ,  $V_{REFL} = V_{SS}$ )**

Symbol	Description	Conditions <sup>1</sup>	Min.	Typ. <sup>2</sup>	Max.	Unit	Notes
V <sub>DDA</sub>	Supply voltage		3	—	5.5	V	
I <sub>DDA_ADC</sub>	Supply current per ADC		—	1	—	mA	3
SMPLTS	Sample Time		275	—	Refer to the <i>Reference Manual</i>	ns	
TUE <sup>4</sup>	Total unadjusted error		—	±4	±8	LSB <sup>5</sup>	6, 7, 8, 9
DNL	Differential non-linearity		—	±0.7	—	LSB <sup>5</sup>	6, 7, 8, 9
INL	Integral non-linearity		—	±1.0	—	LSB <sup>5</sup>	6, 7, 8, 9

1. All accuracy numbers assume the ADC is calibrated with  $V_{REFH}=V_{DDA}=V_{DD}$ , with the calibration frequency set to less than or equal to half of the maximum specified ADC clock frequency.
2. Typical values assume  $V_{DDA} = 5.0\text{ V}$ ,  $\text{Temp} = 25\text{ }^{\circ}\text{C}$ ,  $f_{ADCK} = 40\text{ MHz}$ ,  $R_{AS}=20\ \Omega$ , and  $C_{AS}=10\text{ nF}$  unless otherwise stated.
3. The ADC supply current depends on the ADC conversion rate.
4. Represents total static error, which includes offset and full scale error.
5.  $1\text{ LSB} = (V_{REFH} - V_{REFL})/2^N$
6. The specifications are with averaging and in standalone mode only. Performance may degrade depending upon device use case scenario. When using ADC averaging, refer to the *Reference Manual* to determine the most appropriate settings for AVGS.
7. For ADC signals adjacent to  $V_{DD}/V_{SS}$  or XTAL/EXTAL or high frequency switching pins, some degradation in the ADC performance may be observed.
8. All values guarantee the performance of the ADC for multiple ADC input channel pins. When using ADC to monitor the internal analog parameters, assume minor degradation.
9. All the parameters in the table are given assuming system clock as the clocking source for ADC.

**NOTE**

- Due to triple bonding in lower pin packages like the 64-LQFP, degradation might be seen in ADC parameters.
- When using high speed interfaces such as the QuadSPI, there may be some ADC degradation on the adjacent analog input paths. See following table for details.

Pin name	TGATE purpose
PTE8	CMP0_IN3
PTC3	ADC0_SE11/CMP0_IN4
PTC2	ADC0_SE10/CMP0_IN5
PTD7	CMP0_IN6
PTD6	CMP0_IN7
PTD28	ADC1_SE22
PTD27	ADC1_SE21

	3.3V Reference Voltage	—	6	9	$\mu\text{A}$
	5V Reference Voltage	—	10	16	$\mu\text{A}$
INL <sup>5</sup>	8-bit DAC integral non-linearity	-0.75	—	0.75	LSB <sup>6</sup>
DNL	8-bit DAC differential non-linearity	-0.5	—	0.5	LSB <sup>6</sup>
$t_{DDAC}$	Initialization and switching settling time	—	—	30	$\mu\text{s}$

1. Difference at input > 200mV
2. Applied  $\pm (100 \text{ mV} + V_{HYST0/1/2/3} + \text{max. of } V_{AIO})$  around switch point.
3. Applied  $\pm (30 \text{ mV} + 2 \times V_{HYST0/1/2/3} + \text{max. of } V_{AIO})$  around switch point.
4. Applied  $\pm (100 \text{ mV} + V_{HYST0/1/2/3})$ .
5. Calculation method used: Linear Regression Least Square Method
6.  $1 \text{ LSB} = V_{\text{reference}}/256$

### NOTE

For comparator IN signals adjacent to  $V_{DD}/V_{SS}$  or XTAL/EXTAL or switching pins cross coupling may happen and hence hysteresis settings can be used to obtain the desired

comparator performance. Additionally, an external capacitor (1nF) should be used to filter noise on input signal. Also, source drive should not be weak (Signal with < 50 K pull up/down is recommended).

Figure 14. Typical hysteresis vs. Vin level (VDDA = 3.3 V, PMODE = 1)

Figure 15. Typical hysteresis vs. Vin level (VDDA = 5 V, PMODE = 0)

Figure 16. Typical hysteresis vs. Vin level (VDDA = 5 V, PMODE = 1)

## 6.5 Communication modules

### 6.5.1 LPUART electrical specifications

Refer to [General AC specifications](#) for LPUART specifications.

#### 6.5.1.1 Supported baud rate

Baud rate = Baud clock / ((OSR+1) \* SBR).

For details, see section: 'Baud rate generation' of the *Reference Manual*.

### 6.5.2 LPSPI electrical specifications

The Low Power Serial Peripheral Interface (LPSPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic LPSPI timing modes.

- All timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  thresholds.
- All measurements are with maximum output load of 50 pF, input transition of 1 ns and pad configured with fastest slew setting ( DSE = 1 ).

					Master Loopback <sup>6</sup>	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ns	

1. Trace length should not exceed 11 inches for SCK pad when used in Master loopback mode.
2. While transitioning from HSRUN mode to RUN mode, LPSP1 output clock should not be more than 14 MHz.
3.  $f_{\text{periph}} = \text{LPSP1 peripheral clock}$
4.  $t_{\text{periph}} = 1/f_{\text{periph}}$
5. Master Loopback mode - In this mode LPSP1\_SCK clock is delayed for sampling the input data which is enabled by setting LPSP1\_CFGR1[SAMPLE] bit as 1. Clock pads used are PTD15 and PTE0. Applicable only for LPSP10.
6. Master Loopback (slow) - In this mode LPSP1\_SCK clock is delayed for sampling the input data which is enabled by setting LPSP1\_CFGR1[SAMPLE] bit as 1. Clock pad used is PTB2. Applicable only for LPSP10.
7. This is the maximum operating frequency ( $f_{\text{op}}$ ) for LPSP10 with medium PAD type only. Otherwise, the maximum operating frequency ( $f_{\text{op}}$ ) is 12 Mhz.
8. Set the PCSSCK configuration bit as 0, for a minimum of 1 delay cycle of LPSP1 baud rate clock, where PCSSCK ranges from 0 to 255.
9. Set the SCKPCS configuration bit as 0, for a minimum of 1 delay cycle of LPSP1 baud rate clock, where SCKPCS ranges from 0 to 255.
10. Maximum operating frequency ( $f_{\text{op}}$ ) is 12 MHz irrespective of PAD type and LPSP1 instance.
11. Applicable for LPSP10 only with medium PAD type, with maximum operating frequency ( $f_{\text{op}}$ ) as 14 MHz.

Communication modules

1. If configured as an output.
2. LSBF = 0. For LSBF = 1, bit order is LSB, bit 1, ..., bit 6, MSB.

**Figure 17. LPSPI master mode timing (CPHA = 0)**

1. If configured as output
2. LSBF = 0. For LSBF = 1, bit order is LSB, bit 1, ..., bit 6, MSB.

### 6.6.2 Trace electrical specifications

The following table describes the Trace electrical characteristics.

- Measurements are with maximum output load of 50 pF, input transition of 1 ns and pad configured with fastest slew settings (DSE = 1'b1).
- While doing the mode transition (RUN -> HSRUN or HSRUN -> RUN ), the interface should be OFF.

Table 31. Trace specifications

	Symbol	Description	RUN Mode			HSRUN Mode		VLPR Mode	Unit
			80	48	40	112	80		
—	Fsys	System frequency	80	48	40	112	80	4	MHz

Table continues on the next page...

**Table 31. Trace specifications (continued)**

## 7 Thermal attributes

### 7.1 Description

The tables in the following sections describe the thermal characteristics of the device.

#### NOTE

Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting side (board) temperature, ambient temperature, air flow, power dissipation or other components on the board, and board thermal resistance.

### 7.2 Thermal characteristics

Table 33. Thermal characteristics for the 64/100-pin LQFP package

Rating	Conditions	Symbol	Packages	Values			Unit
				MWCT1014S	MWCT1015S	MWCT1016S	
Thermal resistance, Junction to Ambient (Natural Convection) <sup>1,2</sup>	Single layer board (1s)	$R_{\theta JA}$	64	61	59	NA	°C/W
			100	52	21	NA	°C/W
Thermal resistance, Junction to Ambient (Natural Convection) <sup>1</sup>	Two layer board (1s1p)	$R_{\theta JA}$	64	45	44	NA	°C/W
			100	42	40	NA	°C/W
Thermal resistance, Junction to Ambient (Natural Convection) <sup>1,2</sup>	Four layer board (2s2p)	$R_{\theta JA}$	64	43	41	NA	°C/W
			100	40	39	NA	°C/W
Thermal resistance, Junction to Ambient (@200 ft/min) <sup>1,3</sup>	Single layer board (1s)	$R_{\theta JMA}$	64	49	48	NA	°C/W
			100	42	41	NA	°C/W
Thermal resistance, Junction to Ambient (@200 ft/min) <sup>1</sup>	Two layer board (1s1p)	$R_{\theta JMA}$	64	38	37	NA	°C/W
			100	35	34	NA	°C/W
Thermal resistance, Junction to Ambient (@200 ft/min) <sup>1,3</sup>	Four layer board (2s2p)	$R_{\theta JMA}$	64	36	35	NA	°C/W
			100	34	33	NA	°C/W
Thermal resistance, Junction to Board <sup>4</sup>	—	$R_{\theta JB}$	64	25	23	NA	°C/W
			100	25	24	NA	°C/W
Thermal resistance, Junction to Case <sup>5</sup>	—	$R_{\theta JC}$	64	12	11	NA	°C/W
			100	12	11	NA	°C/W
Thermal resistance, Junction to Package Top <sup>6</sup>	Natural Convection	$\psi_{JT}$	64	2	2	NA	°C/W
			100	2	2	NA	°C/W

- Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
- Per JEDEC JESD51-2 with natural convection for horizontally oriented board. Board meets JESD51-9 specification for 1s or 2s2p board, respectively.
- Per JEDEC JESD51-6 with forced convection for horizontally oriented board. Board meets JESD51-9 specification for 1s or 2s2p board, respectively.
- Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
- Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
- Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

**Table 34. Thermal characteristics for the 100 MAPBGA package**

Rating	Conditions	Symbol	Values			Unit
			MWCT1015S	MWCT1014S	MWCT1016S	
Thermal resistance, Junction to Ambient (Natural Convection) 1, 2	Single layer board (1s)	$R_{\theta JA}$	57.2	61.0	52.5	°C/W
Thermal resistance, Junction to Ambient (Natural Convection) 1, 2, 3	Four layer board (2s2p)	$R_{\theta JA}$	32.1	35.6	27.5	°C/W
Thermal resistance, Junction to Ambient (@200 ft/min) <sup>1, 2, 3</sup>	Single layer board (1s)	$R_{\theta JMA}$	44.1	46.6	39.0	°C/W
Thermal resistance, Junction to Ambient (@200 ft/min) <sup>1, 3</sup>	Two layer board (2s2p)	$R_{\theta JMA}$	27.2	30.9	22.8	°C/W
Thermal resistance, Junction to Board <sup>4</sup>	—	$R_{\theta JB}$	15.3	18.9	11.2	°C/W
Thermal resistance, Junction to Case <sup>5</sup>	—	$R_{\theta JC}$	10.2	14.2	7.5	°C/W
Thermal resistance, Junction to Package Top outside center <sup>6</sup>	—	$\psi_{JT}$	0.2	0.4	0.2	°C/W
Thermal resistance, Junction to Package Bottom outside center <sup>7</sup>	—	$\psi_{JB}$	12.2	15.9	18.3	°C/W

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.
7. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

### 7.3 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature,  $T_J$ , can be obtained from this equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

- $T_A$  = ambient temperature for the package ( $^{\circ}\text{C}$ )
- $R_{\theta JA}$  = junction to ambient thermal resistance ( $^{\circ}\text{C}/\text{W}$ )
- $P_D$  = power dissipation in the package ( $\text{W}$ )

The junction to ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. Unfortunately, there are two values in common usage: the value determined on a single layer board and the value obtained on a board with two planes. For packages such as the PBGA, these values can be different by a factor of two. Which value is closer to the application depends on the power dissipated by other components on the board. The value obtained on a single layer board is appropriate for the tightly packed printed circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated.

When a heat sink is used, the thermal resistance is expressed in the following equation as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

- $R_{\theta JA}$  = junction to ambient thermal resistance ( $^{\circ}\text{C}/\text{W}$ )
- $R_{\theta JC}$  = junction to case thermal resistance ( $^{\circ}\text{C}/\text{W}$ )
- $R_{\theta CA}$  = case to ambient thermal resistance ( $^{\circ}\text{C}/\text{W}$ )

$R_{\theta JC}$  is device related and cannot be influenced by the user. The user controls the thermal environment to change the case to ambient thermal resistance,  $R_{\theta CA}$ . For instance, the user can change the size of the heat sink, the air flow around the device, the interface material, the mounting arrangement on printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device.

To determine the junction temperature of the device in the application when heat sinks are not used, the Thermal Characterization Parameter ( $\Psi_{JT}$ ) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using this equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

- $T_T$  = thermocouple temperature on top of the package ( $^{\circ}\text{C}$ )
- $\Psi_{JT}$  = thermal characterization parameter ( $^{\circ}\text{C}/\text{W}$ )
- $P_D$  = power dissipation in the package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

## 8 Dimensions

### 8.1 Obtaining package dimensions

Package dimensions are provided in the package drawings.

To find a package drawing, go to <http://www.nxp.com> and perform a keyword search for the drawing's document number:

Package option	Document Number
64-pin LQFP	98ASS23234W
100-pin LQFP	98ASS23308W
100-pin MAPBGA	98ASA00802D

## 9 Pinouts

### 9.1 Package pinouts and signal descriptions

For package pinouts and signal descriptions, refer to the Reference Manual.

## 10 Revision History

## Legal information

### Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <https://www.nxp.com>.

### Definitions

**Draft** — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <https://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Quick reference data** — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Translations** — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

**Security** — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at [PSIRT@nxp.com](mailto:PSIRT@nxp.com)) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

**Suitability for use in automotive applications (functional safety)** — This NXP product has been qualified for use in automotive applications. It has been developed in accordance with ISO 26262, and has been ASIL classified accordingly. If this product is used by customer in the development of, or for incorporation into, products or services (a) used in safety critical applications or (b) in which failure could lead to death, personal injury, or severe physical or environmental damage (such products and services hereinafter referred to as "Critical Applications"), then customer makes the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, safety, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. As such, customer assumes all risk related to use of any products in Critical Applications and NXP and its suppliers shall not be liable for any such use by customer. Accordingly, customer will indemnify and hold NXP harmless from any claims, liabilities, damages and associated costs and expenses (including attorneys' fees) that NXP may incur related to customer's incorporation of any product in a Critical Application.

**NXP B.V.** — NXP B.V. is not an operating company and it does not distribute or sell products.

## Trademarks
